PAYN, JAMES (1830–1898). English novelist, was born at Cheltenham, on the 28th of February 1830, his father being clerk to the Thames Commissioners and treasurer to the county of Berkshire. He was educated at Eton, and afterwards entered the Military Academy at Woolwich; but his health was not equal to the demands of a military career, and he proceeded in 1847 to Trinity College, Cambridge. He was among the most popular men of his time, and served as president of the Union. Before going to Cambridge he had published some verses in Leigh Hunt’s Journal, and while still an undergraduate put forth a volume of Stories from Boccaccio in 1852, and in 1853 a volume of Poems. In the same year he left Cambridge, and shortly afterwards married Miss Louisa Adelaide Edlin, sister of Sir Peter Edlin. He then settled down in the Lake district to a literary career and contributed regularly to Household Words and Chambers’s Journal. In 1858 he removed to Edinburgh to act as joint-editor of the latter periodical. He became sole editor in 1859, and conducted the magazine with much success for fifteen years. He removed to London in 1861. In the pages of the Journal he published in 1864 his most popular story, Lost Sir Massinger. From this time he was always engaged in novel-writing, among the most popular of his productions being Married Beneath Him (1865), Carlyon’s Year (1868), By Proxy (1878), and The Talk of the Town (1885). In 1883 he succeeded Leslie Stephen as editor of the Cornhill Magazine and continued in the post until the breakdown of his health in 1896. He was also literary adviser to Messrs Smith, Elder & Company. His publications included a Handbook to the English Lakes (1859), and various volumes of occasional essays, Maxims by a Man of the World (1869), Some Private Views (1881), Some Literary Recollections (1884). A posthumous work, The Backwater of Life (1899), revealed much of his own personality in a mood of kindly, sensible reflection upon familiar topics. He died in London, on the 25th of March 1898.

A biographical introduction to The Backwater of Life was furnished by Sir Leslie Stephen.

PAYNE, PETER (c. 1380–1455). English Lollard and Taborite, the son of a Frenchman by an English wife, was born at Houghton-the-Hill near Grantham, about 1380. He was educated at Oxford, where he adopted Lollard opinions, and had graduated as a master of arts before the 6th of October 1406, when he was concerned in the irregular proceedings through which a letter declaring the sympathy of the university was addressed to the Bohemian reformers. From 1410 to 1414 Payne was principal of St Edmund Hall, and during these years was engaged in controversy with Thomas Netter of Walden, the Carmelite defender of Catholic doctrine. In 1414 he was compelled to leave Oxford and taught for a time in London. Ultimately he had to flee from England, and took refuge in Bohemia, where he was received by the university of Prague on the 13th of February 1417, and soon became a leader of the reformers. He joined the sect of the “Orphans,” and had a prominent part in the discussions and conferences of the ten years from 1420 to 1430. When the Bohemians agreed to send representatives to the Council of Basel, Payne was naturally chosen to be one of their delegates. He arrived at Basel, on the 4th of January 1433, and his unyielding temper and bitter words probably did much to prevent a settlement. The Bohemians left Basel in April. The party of the nobles, who had been ready to make terms, were attacked in the Diet at Prague, by the Orphans and Taborites. Next year the dispute led to open war. The nobles were victorious at Lipau on the 29th of May 1434, and it was reported in England that Payne was killed. When soon afterwards the majority of the Orphans joined the moderate party, Payne allied himself with the more extreme Taborites. Nevertheless his reputation was so great that he was accepted as an arbitrator in doctrinal disputes amongst the reformers. In February 1437 the pope desired the emperor Sigismund to send Payne to be tried for heresy at Basel. Payne had to leave his pastorate at Saas, and took refuge with Peter Chelicky, the Bohemian author. Two years later he was captured and imprisoned at Gutenstein, but was ransomed by his Taborite friends. Payne took part in the conferences of the Bohemian parties in 1443–1444, and again in 1452. He died at Prague in 1455. He was a learned and eloquent controversialist, and a faithful adherent to Wycliffe’s doctrine. Payne was also known as Clerk at Oxford, as Peter English in Bohemia, and as Freyng, after his French father, and Hough from his birth place.

PAYNTER (or PAINTER), WILLIAM (c. 1540–1594), English author, was a native of Kent. He matriculated at St John’s College, Cambridge, in 1554. In 1561 he became clerk of the ordinance in the Tower of London, a position in which he appears to have amassed a fortune out of the public funds. In 1586 he confessed that he owed the government a thousand pounds, and in the next year further charges of peculation were brought against him. In 1590 his son Anthony owned that he and his father had abused their trust, but Paynter retained his office until his death. This event probably followed
immediately upon his will, which was nuncupative and was dated the 14th of February 1594. The first volume of his *Palace of Pleasure* appeared in 1566, and was dedicated to the earl of Warwick. It included sixty tales, and was followed in the next year by a second volume containing thirty-four new ones. A second improved edition in 1575 contained seven new stories. Paynter borrows from Herodotus, Plutarch, Aulus Gellius, Aelian, Livy, Tacitus, Quintus Curtius; from Giraldus Cynthio, Matteo Bandello, Ser Giovanni Fiorentino, Straparola, Queen Margaret of Navarre and others. To the vogue of this and similar collections we owe the Italian setting of so large a proportion of the Elizabethan drama. The early tragedies of Appius and Virginia, and Tancred and Gismund were taken from The Palace of Pleasure; and among better-known plays derived from the book are the Shakespearian *Timon of Athens*, *All's Well that Ends Well* (from Giletta of Narbonne), Beaumont and Fletcher's *Triumph of Death* and Shirley's *Love's Cruelty*.

*The Palace of Pleasure* was edited by Joseph Hasluck in 1813. This edition was collated (1860) with the British Museum copy of 1575 by Mr Joseph Jacobs, who added further preatory matter, including an introduction dealing with the importance of Italian novelle in Elizabethan drama.

**Paysandú**—**Pea**

PAYSANDÚ, or PAISANDÓ, a town and river port of Uruguay and capital of a department of the same name, on the left bank of the Uruguay River about 214 m. N.W. of Montevideo, with which it is connected by rail. Pop. (1908 estimate), 15,000. It has railway connexion with Rio Negro and Montevideo to the south-east, and with Salto and Santa Rosa, on the Brazilian frontier, on the north; it is at the head of low water navigation on the Uruguay River, and is in regular steamer communication with Montevideo and Buenos Aires. There are some good public buildings, including two churches, a hospital, a theatre and the government offices. Paysandú exports cattle and sheep and salted meats, hides, ox tongues, wool and other animal products. There is a meat-curing establishment (saladero) at Guaviyuí, in the vicinity. The town was named in honour of Pay, or Pá (Father) Sandú, a priest who settled there in 1772. It has suffered severely from revolutionary outbreaks, was bombarded by Rivera in 1846, and was partly destroyed in 1865 by a Brazilian bombardment, after which its gallant defenders, Leandro Gomez and his companions, were butchered in cold blood.

The department of Paysandú—area 5117 sq. m.; pop. (1907 estimate), 54,007—is one of the richest stock-raising regions of the republic.

**Payson, Edward** (1783–1827). American Congregational preacher, was born on the 25th of July 1783 at Rindge, New Hampshire, where his father, Seth Payson (1758–1820), was pastor of the Congregational Church. His uncle, Phillips Payson (1736–1801), pastor of a church in Chelsea, Massachusetts, was a physician and astronomer. Edward Payson graduated at Harvard in 1803, was then principal of a school at Portland, Maine, and in 1807 became junior pastor of the Congregational Church at Portland, where he remained, after 1811, as senior pastor, until his death on the 22nd of October 1827.

The most complete collection of his sermons, with a memoir by Asa Cummings originally published in 1828, is the *Memoir, Select Thoughts and Sermons of the late Rev. Edward Payson* (3 vols., Portland 1850). Published on this is the volume, *Mementos of Edward Payson* (New York, 1873), by the Rev. E. L. Jones of the Methodist Episcopal Church.

**Pázmány, Péter** (1570–1637), Hungarian cardinal and statesman, was born at Nagyvárado on the 4th of October 1570, and educated at Nagyvárado and Kolozsvár, at which latter place he quitted the Calvinist confession for the Roman communion (1589). In 1587 he entered the Jesuit order. Pázmány went through his probation at Cracow, took his degree at Vienna, and studied theology at Rome, and finally completed his academic course at the Jesuit college at Graz. In 1601 he was sent to the order's establishment at Selley, where his eloquence and dialectic won back hundreds to Rome, including many of the noblest families. Prince Nicholas Esterházy and Paul Rákóczy were among his converts. In 1607 he was attached to the archbishop of Estergom, and in the following year attracted attention by his denunciation, in the Dict, of the 8th point of the peace of Vienna, which prohibited the Jesuits from acquiring landed property in Hungary. At about the same time the pope, on the petition of the emperor Matthias II, released Pázmány from his monkish vows. On the 25th of April 1616 he was made dean of Turóc, and on the 28th of September became primate of Hungary. He received the red hat from Urban VIII, in 1629. Pázmány was the soul of the Roman Catholic reaction in Hungary. Particularly remarkable is his *Igazságra vezető Kalauz (Guide to Truth)*, which appeared in 1613. This manual united all the advantages of scientific depth, methodical arrangement and popular style. As the chief pastor of the Hungarian church Pázmány used every means in his power, short of absolute contravention of the laws, to obstruct and weaken Protestantism, which had risen during the 16th century. In 1619 he founded a seminary for theological candidates at Nagyszombat, and in 1623 laid the foundations of a similar institution at Vienna, the still famous Pázmanaeum, at a cost of 200,000 florins. In 1635 he contributed 100,000 florins to the foundation of a Hungarian university. He also built Jesuit colleges and schools at Pressburg, and Franciscan monasteries at Ersékkývár and Kőrmöcbánya. In politics he played a considerable part. It was chiefly due to him that the diet of 1618 elected the archduke Ferdinand to succeed the childless Matthias II. He also repeatedly thwarted the martial ambitions of Gabriel Bethlen, and prevented George Rákóczi I., over whom he had a great influence, from combining with the Turks and the Protestants. But Pázmány's most unforgettable service to his country was his creation of the Hungarian literary language. As an orator he well deserved the epithet of "the Hungarian purple Cicero." Of his numerous works the chief are: *The Four Books of Thomas à Kempis on the imitation of Christ* (Hung., 1603), of which there are many editions; *Diatribe theologica de visibilis Christi in terris ecclesiae* (Graz, 1615); *Vindiciae ecclesiasticae* (Vienna, 1620); *Sermons for every Sunday in the Year* (Hung., Pressburg, 1636); *The Triumph of Truth* (Hung., Pressburg, 1614).

See Vilma Fraknó, *Péter Pázmány és his Times* (Hung. Pest, 1806–1872); *Correspondence of Pázmány* (Hung. and Latin), published by the Hungarian Academy (Pest, 1873).

(R. N. B.)

**Paz Soldan, Mariano Felipe** (1821–1886), Peruvian historian and geographer, was born at Arequipa, on the 22nd of August 1821. He studied law, and after holding some minor judicial offices, was minister to New Granada in 1853. After his return he occupied himself with plans for the establishment of a model penitentiary at Lima, which he was enabled to accomplish through the support of General Castilla. In 1860 Castilla made him director of public works, in which capacity he superintended the erection of the Lima statue of Bolivar. He was also concerned in the reform of the currency by the withdrawal of the debased Bolivian coins. In 1861 he published his great atlas of the republic of Peru, and in 1868 the first volume of his history of Peru after the acquisition of her independence. A second volume followed, and a third, bringing the history down to 1876, was published after his death by his son. In 1879 he was minister of justice and worship under President Balta, but shortly afterwards retired from public life to devote himself to his great geographical dictionary of Peru, which was published in 1877. During the disastrous war with Chile he sought refuge at Buenos Aires, where he made professor in the National College, and where he wrote and published a history of the war (1884). He died on the 31st of December 1886.

**Péa (Pisum)**, a genus of the order Leguminosae, consisting of herbs with compound pinnate leaves ending in tendrils, by means of which the weak stems are enabled to support themselves, and with large leafy stipules at the base. The flowers (fig. 1) are typically "papilloseous," with a "standard" or large petal above, two side petals or wings, and two front petals below forming the keel. The stamens are ten—nine united, the tenth usually free or only slightly joined to the others.
This separation allows approach to the bonny which is secreted at the base of the staminal tube. The ovary is prolonged into a long, thick, bent style, compressed from side to side at the tip and fringed with hairs. The fruit is a characteristic "legume" or pod (fig. 2), bursting when ripe into halves, which bear the large globular seeds (peas) on their edges. These seeds are on short stalks, the upper extremity of which is dilated into a shallow cup (aril); the two seed-leaves (cotyledons) are thick and fleshy, with a radicle bent along their edges on one side. The genus is exceedingly close to Lathyrus, being only distinguished technically by the style, in which the latter genus is compressed from above downwards and not thick.

It is not surprising, therefore, that under the general name "pea" species both of *Pisum* and of *Lathyrus* are included. The common field pea with tan-coloured or cored, flat, wrinkled seeds and two to four leaflets is *Pisum arvense*, which is cultivated in all temperate parts of the globe, but which, according to the Italian botanists, is truly a native of central and southern Italy: it has purple flowers. The garden pea, *P. sativum*, which has white flowers, is more tender than the preceding, and its origin is not known. It has not been found in a wild state anywhere, and it is considered that it may be a form of *P. arvense*, having, however, from four to six leaflets to each leaf and globular seeds of uniform colour.

*P. sativum* was known to Theophrastus; and De Candolle (*Origin of Cultivated Plants*, p. 329) points out that the *Pisum* or its equivalent occurs in the Albanian tongue as well as in Latin, whence he concludes that the pea was known to the Aryans, and was cultivated with great importance in Greece and Italy. Peas have been found in the Swiss lake-dwellings of the Bronze period. The garden peas differ considerably in size, shape of pod, degree of productive- ness, form and colour of foliage, bearded or not; but the inner lining of the pod is very thin instead of being somewhat horny, so that the whole pod can be eaten. Unlike most papilionaceous plants, pea flowers are perfectly fertile without the aid of insects, and thus do not intercross so freely as most similar plants do.

On the other hand, a case is known where the pollen from a purple-podded pea applied to the stigma of one of the green-podded sugar peas produced a purple pod, showing that not only the ovule but even the ovary was affected by the cross. The numerous varieties of peas in cultivation have been obtained by cross-fertilization, but chiefly by selection. Peas cultivate a highly nutritious article of diet from the large quantity of nutritious materials they contain in addition to starchy and saccharine matters.

The sweet pea, cultivated for the beauty and fragrance of its flowers, is a species of the allied genus *Lathyrus* (*L. odoratus*), a native of southern Europe. The chick pea (q.v.) (*Cicer arietinum*), not cultivated in England, is still farther removed from the true peas. The everlasting pea of gardens is a species of *Lathyrus* (*L. latifolius*) with very deep fleshy roots, bold foliage, and beautiful but scentless flowers; the field pea (*Pisum arvense*) is better adapted than the others to light soils, and is used cultivated in rows of such a width that the stems may be covered by the hedges. The early stage at which the plants fall over, and forbid further culture, renders it even more needful than in the case of beans to sow them only on land already clean. If annual weeds can be kept in check until the peas once get a close cover, they then occupy the ground so completely that nothing else can live under them; and the ground, after their removal, is found in the choicest condition. A thin crop of peas should never be allowed to stand, as the land is sure to get perfectly wild. The difficulty of getting this crop well rendered harvests it peculiarly advisable to sow only the early varieties. The pea prefers a friable calcareous loam, deeply worked, and well enriched with good manure or farm-yard manure. The early crops require a warm sheltered situation, and the later are better grown 6 or 8 ft. apart, or more, in the open quarters, dwarf crops being introduced between the rows. The dwarf or early sorts may be sown 5 or 4 ft. apart. The deep working of the soil is of importance; first drills should be suffused with sodew or arrest of growth. The first sowing may be made about the beginning or middle of November, in front of a south wall, the plants being deflected by spruce fir branches or other spray throughout the winter. In early years, the seeds are sown in flower pots or boxes, and the young plants afterwards planted out. The main crop should be sown towards the end of February, and moderate sowings should be made twice a month afterwards, up to the beginning of July for those intended to form ridges 7 or 8 in. high, these ridges being well watered, and the seed sown on them in single rows. If dry weather at any time occurs, water should be supplied profusely once a week.

In the production early peas the French gardeners used to sow early in November, in frames, on a border having a good aspect, the seeds being covered very slightly. The young plants are transplanted into other frames in December, the ground inside being dug and hoed, so as to be ready before the sashes, and the earth thus removed placed against the outside of the sashes. The young plants, when 3 or 4 in. high, are planted in patches of three or four, in asunder, in four longitudinal rows. The sashes are covered with straw mats, and opened whenever the weather is sufficiently mild. When the first inclined towards the back of the frame, a little earth being drawn to their base, and when the plants come into blossom the tops are pinched out above the third or fourth flower to force them into bearing. As soon as the pods begin to form, the seedlings have a gentle watering whenever sufficiently warmed by the sun, but a too vigorous growth at an earlier period would be detrimental. Thus treated the plants bear pods fit for gathering in the first fortnight in April.

A very early pea is to sow in 5-in. pots, a few seeds in each, the plants to be ultimately planted out on a warm border. Peas may also be obtained early if gently forced in frames, in the same way as kidney beans, the darkest varieties being the best. For the very early peas the rows should range east and west, but for the main crops north and south. The average depth of the drills should be about 2 in. for small sorts, and 4 in. more for the larger kinds. The drills should be made wide and flat at bottom so that the seeds may be better separated in sowing. The large sorts are the better for being sown 3 in. apart. Chopped furze may be advantageously scattered in the drill before covering in, to check the depredations of mice, and before leveling the surface the soil should be gently trodden down over the seeds. A good selection of sorts may be made from the following:

**Early.**—William Hurst; Chelsea Gem; Sutton's Bountiful and Excelsior; Gradus. **Late.**—Stratagem; Telephone; Telegraph; Carter's Daisy; Duke of York; Veitch's Autocrat.

**Early.**—Veitch's Perfection; Ne Plus Ultra, the finest of all late peas, but a little delicate in cold wet soils and seasons; British Queen; Champion of England; Duke of Albany.

**PEABODY, ANDREW PRESTON** (1813-1893), American clergyman and author, was born in Beverly, Massachusetts, on the 19th of March 1813, and was descended from Lieut. Francis Peabody of St Albans, who emigrated to Massachusetts in 1633. He read to be three years old, entered Harvard College at the age of twelve, and graduated in 1826, with the single exception of Judge Dudley (class of 1690) the youngest graduate of Harvard. In 1827 he was assistant pastor of the South Parish (Unitarian) of Portsmouth, New Hampshire; the senior pastor died before Peabody had been preaching a month, and he succeeded to the charge of the church, which he held until 1860. In 1852-1860 he was proprietor and editor of the *North American Review*. He was preacher to
Harvard University and Plummer professor of Christian morals from 1860 to 1881, and was professor emeritus from 1881 until his death in Boston, Massachusetts, on the 10th of March 1893. On the walls of Appleton Chapel, Cambridge, U.S.A., is a bronze tablet to his memory.

Besides many brief memoirs and articles, he wrote: Christianity the Religion of Nature (2d ed., 1864), Lowell Institute Lectures; Reminiscences of European Travel (1868); A Manual of Moral Philosophy (1873); Christian Belief and Life (1875), and Harvard Reminiscences (1888). See the Memoir (Cambridge, 1896) by Edward J. Young.

PEABODY, ELIZABETH PALMER (1804–1894), American educationist, was born at Billerica, Massachusetts, on the 16th of May 1804. Early in life she was assistant in A. Bronson Alcott's school in Boston, Mass., the best account of which is probably her Record of Mr Alcott's School (1835). She had been instructed in Greek by Emerson at Concord when she was eighteen years old. She became interested in the educational methods of Froebel, and in 1860 opened in Boston a small school resembling a kindergarten. In 1867 she visited Germany for the purpose of studying Froebel's methods. It was largely through her efforts that the first public kindergarten in the United States was established in Boston in 1870. She died at Jamaica Plain, Boston, on the 3rd of January 1894. She was the sister-in-law of Nathaniel Hawthorne and of Horace Mann.

Among her publications are: Kindergarten in Italy (1872); Reminiscences of William Ellery Channing (1880); Lectures in the Training Schools for Kindergartners (1888); and Last Evening with Allston, and other Papers (1886).

PEABODY, GEORGE (1795–1860), American philanthropist, was descended from an old yeoman family of Hertfordshire, England, named Pabody or Pabody. He was born in the part of Danvers which is now Peabody, Mass., on the 18th of February 1795. When eleven years old he became apprentice at a grocery store. At the end of four years he became assistant to his brother, and a year afterwards to his uncle, who had a business in Georgetown, District of Columbia. After serving as a volunteer at Fort Warburton, Maryland, in the War of 1812, he became partner with Elisha Riggs in a dry goods store at Georgetown, Riggs furnishing the capital, while Peabody was manager. Through his energy and skill the business increased with astounding rapidity, and on the retirement of Riggs about 1830 Peabody found himself at the head of one of the largest mercantile concerns in the world. About 1837 he established himself in London as merchant and money-broker at Watford Court, in the city, and in 1843 he withdrew from the American business. The number of his benefactions to public objects was very large. He gave £50,000 for educational purposes at Danvers; £200,000 to found and endow a scientific Institute in Baltimore; various sums to Harvard University; £700,000 to the trustees of the Peabody Educational Fund to promote education in the southern states; and £500,000 for the erection of dwelling-houses for the working-classes in London. He presented to Queen Victoria the offer of a baronetcy, but declined it. In 1867 the United States Congress awarded him a special vote of thanks. He died in London on the 4th of November 1860; his body was carried to America in a British warship, and was buried in his native town.

See the Life (Boston, 1870) by Phoebe A. Hanaford.

PEABODY, a township of Essex county, Massachusetts, U.S.A., in the eastern part of the state, 2 m. N.W. of Salem. Pop. (1900) 13,098; (1910) 15,721. It is served by the Boston & Maine railroad. The township covers an area of 17 sq. m. Its principal village is also known as Peabody. It contains the Peabody institute (1852), a gift of George Peabody; in 1900 the institute had a library of 43,200 vols., and in connexion with it is the Eben Dale Sutton reference library, containing 4100 vols. in 1909. In the institute is the portrait of Queen Victoria given by her to Mr Peabody. Among the places of interest in the township are the birthplace of George Peabody, the home of Rufus Choate (who lived here from 1823 to 1828), and the old burying-ground, where many soldiers of the War of Independence are buried; and the town has a Lexington monument, dedicated in 1835, and a soldiers' monument, dedicated in 1881. Manufacturing is the principal industry, and leather is the principal product; among other manufactures are shoes, gloves, and carriages. The value of the factory products in 1905 was $10,236,660, an increase of 47.4% over that for 1900, and of the total the leather product represented 77.3%.

Peabody was originally a part of the township of Salem. In 1752 the district of Danvers was created, and in 1757 this district was made a separate township. In 1855 the township was divided into Danvers and South Danvers, and in 1868 the name of South Danvers was changed to Peabody, in honour of George Peabody.

See Old Naumkeag (Salem, 1877), by C. H. Webber and W. H. Nevins.

PEACE, a river of western Canada. It rises in the Rocky Mountains near 55° N., and breaking through the mountains, flows N.E. into Slave River, near lake Athabasca. The district between 50° 40' and 60° N., and between 112° W. and the Rocky Mountains is usually known as the Peace River district.

PEACE (Lat. pax; Fr. paix; Ger. Friede), the contrary of war, conflict or turmoil, and the condition which follows their cessation. Its sense in international law is the condition of not being at war. The word is also used as an abridgment for a treaty of peace, in such cases as the Peace of Utrecht (1713) and the Peace of Amiens (1802).

Introduction.—Peace until quite recently was merely the political condition which prevailed in the intervals between wars. It was a purely negative condition. Even Grotius, who reduced the tendencies existing in his time to a sort of orderly expression, addressed himself to the law of peace as the positive part of international jurisprudence and dealt only with peace as its negative alternative. The very name of his historic treatise, De jure bell i ac pacis (1625), shows the subordination of peace to the main subject of war. In our own time peace has attained a higher status. It is now customary among writers on international law to give peace at any rate a volume to itself. Peace in fact has become a separate branch of the subject. The rise of arbitration as a method of settling international difficulties has carried it a step further, and now the Hague Peace Conventions have given specific methods a standing apart from war, and the preservation of peace has become an object of direct political effort. The methods for ensuring such preservation are now almost as precise as the methods of war. However reluctant some states may be to bind themselves to any rules excluding recourse to brute force when diplomatic negotiations have failed, they have nevertheless unanimously at the Hague Conference of 1907 declared their “firm determination to cooperate in the maintenance of general peace” (la forme volonté de concourir au maintien de la paix générale), and their resolution “to favour with all their efforts the amicable settlement of international conflicts” (preamble to Peace Convention). The center of mediation by independent powers is provided for (Peace Convention: art. 3), and it is specifically agreed that in matters of a “legal character” such as “questions of interpretation and application” of international conventions, arbitration is the “most efficacious and at the same time most equitable method” of settling differences which have not been solved by diplomacy (Peace Convention: art. 38). In the final act, the conference went farther in agreeing to the “principle of compulsory arbitration,” declaring that “certain disputes, in particular those relating to the interpretation and application of the provisions of international agreements, are suitable (susceptible) to be submitted to compulsory arbitration without any restriction.”

These declarations were obviously a concession to the widespread feeling, among civilized nations, that peace is an object in itself, an international political condition requiring its code of methods and laws just as much as the domestic political conditions of nations require their codes of methods and laws. In other words peace among nations has now become, or is fast becoming, a positive subject of international regulation, while war is

1 This has been incorrectly rendered in the English official translation as “the sincere desire to work for the maintenance of general peace.”
PEACE

coming, among progressive peoples, to be regarded merely as an accidental disturbance of that harmony and accord among mankind which nations require for the fostering of their domestic welfare.

Though the idea of preserving peace by general international regulation has had several exponents in the course of ages, no deliberate plan has ever yet been carried into effect. Indirectly, however, there have been many agencies which have operated towards this end. The earliest, known to history, is the Amphictyonic Council (q.v.) which grew out of the common worship of the Hellenes. It was not so much a political as a religious body. "If it had any claim," says Freeman,¹ "to the title of a general council of Greece, it was wholly in the sense in which we speak of general councils in modern Europe. The Amphictyonic Council represented Greece as an ecclesiastical synod represented western Christendom. Its primary business was to regulate the concerns of the temple of Apollo at Delphi. The Amphictyonic Council which met at Delphi was only the most famous of several bodies of the same kind." "It is easy, however," adds Freeman, "to understand how the religious functions of such a body might assume a political character. Thus the old Amphictyonic oath forbade certain extreme measures of hostility against any city sharing in the common Amphictyonic worship, and it was forbidden to raze any Amphictyonic city or to cut off its water. As the only deliberative body in which most Greek communities were represented, its decisions were those of the bulk of the Hellenic people. It sank eventually into a mere political tool in the hands first of Thebes, and then under Philip of Macedonia."

The so-called pax romana was merely peace within an empire governed from a central authority, the constituent parts of which were held together by a network of centralized authority.

The feudal system again was a system of offence and defence, and its object was efficiency for war, not the organized regulation of peace. Yet it had elements of federation within the bonds of its hierarchy.

The spiritual influence of the Church again was exerted to preserve relative peace among feudal princes. The "Truce of God" was established by the clergy (originally in Guyenne in 1031) to take advantage of holy days and festivals for the purpose of restricting the time available for bloodshed.

The "grand design" of Henry IV. (France), which some historians regard merely as the fantastic idea of a visionary, was probably a scheme of his great minister Sully to avert by a federation the conflict which he probably foresaw would break out sooner or later between Catholic and Protestant Europe, and which, in fact, broke out some fifteen years later in the Thirty Years' War.

The Holy Roman Empire itself was in some respects an agent for the preservation of peace among its constituent states. In the same way the federation of Swiss cantons, of the states of the North American Union and of the present German Empire have served as means of reducing the number of possible parties to war, and consequently that of its possible occasions.

Not only the number of possible war-making states but also the territorial area over which war can be made has been reduced in recent times by the creation of neutralized states such as Switzerland, Belgium, Luxemburg and Norway, and areas such as the Congo basin, the American lakes and the Suez Canal.

The "balance of power," which has played in the history of modern Europe such an important part, is inherent in the notion of the independence and stability of states. Just as in Italy the common weal of the different republics which were crowded within the limited area of the peninsula required that no one of them should become so powerful as to threaten the independence of the others, so western Europe had a similar danger to counteract. France, Spain and the Empire were competing with each other in power to the detriment of smaller states. Great Britain and the Netherlands, Prussia and Russia, had interests in the preservation of the status quo, and wars were waged and treaties concluded to adjust the strength of states in the common interest of preventing any one of them from obtaining undue predominance. Then came the break up of what remained of feudal Europe and a readjustment under Napoleon, which left the western world with five fairly balanced homogeneous nations. These now took the place of the old heterogeneous areas, governed by their respective sovereigns without reference to any idea of nationality or of national representation. The leading nations assumed the hegemony of the west, and in more recent times this combination has become known as the "concert of Europe." This concert of the great powers, as its same implies, in contradistinction to the "balance of power," was essentially a factor for the preservation of peace. For a century back it has played the part of an upper council in the management of Europe. In all matters affecting the Near East, it considers itself supreme. In matters of general interest it has frequently called conferences to which the minor states have been invited, such as the West African Conference in Berlin in 1883, and the Anti-Slavery Conference at Brussels in 1889-1890, and the Conference of Algeciras in 1906. Meanwhile the concert has admitted among its members first in 1856 Turkey, later in 1878 at the Congress of Berlin the United States, and now undoubtedly Japan will expect to be included as a great power in this controlling body. The essential feature of the concert has been recognition of the advantage to all the great powers of common action in reference to territorial changes in the Near East, of meeting together as a council, in preference to unconcerted negotiation by the powers acting severally.

A departure of more recent origin has been the calling together of the smaller powers for the settlement of matters of general administrative interest, conferences such as those which led to the conclusion of the conventions creating the Postal Union, the Copyright and Industrial Property Unions, &c.

These conferences of all the powers serve in practice as a sort of common council in the community of states, just as the concert of the great powers acts as a kind of senate. We have thus the nucleus of that international parliament which idealist peace makers have dreamt of since the time of Henry IV.'s "grand design."

This brings us down to the greatest deliberate effort ever made to secure the peace of the world by a general convention. It was due to the initiative of the young tsar Nicholas II., who, in his famous rescript of the 24th of August 1898, stated that he thought that the moment was "very favourable for seeking, by means of international discussion, the most effectual means of assuring to all peoples the benefits of a real and durable peace." "In the course of the last twenty years," added the rescript, "the preservation of peace had become an object of international policy." Economic crises, due in great part to the existing system of exclusive arms to which the transatlantic arms race has been so many national security burden, which peoples has more and more difficulty in bearing. He therefore proposed that there should be an international conference for the purpose of focusing the efforts of all states which were "sincerely seeking to make the great idea of universal peace triumph over the elements of trouble and discord." The first conference was held in 1899, and another followed it in 1907 at the earlier one twenty-six powers were represented; at that of 1907 there were forty-four, this time practically the whole world. The conventions drawn up at the second conference were a deliberate codification of many branches of international law. By them a written law has been substituted for that unwritten law which nations had been wont to construe with a latitude more or less corresponding to their power. At the conference of 1899, moreover, a court of arbitration was instituted for the purpose of dealing judicially with such matters in dispute as the powers agreed to submit to it.

In the interval between the two Hague Conferences, Great Britain and France concluded the first treaty applicable to future difficulties, as distinguished from the treaties which had preceded it, treaties which related in all cases to present difficulties already

existing and confined to them. This treaty made arbitration applicable to all matters not affecting "national honour or vital interests." Since then a network of similar treaties, adopted by different nations with each other and based on the Anglo-French model, has made reference to the Hague Court of Arbitration practically compulsory for all matters which can be settled by an award of damages or do not affect any vital national interest.

The third Hague Conference is timed to be held in 1917. Meanwhile a conference of the maritime powers was held in London in 1908-1909 for the elaboration of a code of international maritime law in time of war, to be applied in the international Court of Prize, which had been proposed in a convention signed at the Hague Conference of 1907.

A further development in the common efforts which have been made by different powers to assure the reign of justice and judicial methods among the states of the world was the proposal of Secretary Knox of the United States to insert in the instrument of ratification of the International Prize Court Convention (adopted at the Hague in 1897) a clause stating that the International Prize Court shall be invested with the duties and functions of a court of arbitral justice, such as recommended by the first Vœu of the Final Act of the conference. The object of this proposal was to give effect to the idea that the existing "permanent" court lacked the essential characteristics of national courts of justice in not being ready at all times to hear cases, and in needing to be specially constituted for every case submitted to it. The new court would be permanently in session at the Hague, the full panel of judges to assemble in ordinary or extraordinary session once a year.

Thus, while armaments are increasing, and wars are being fought out in the press and in public discussion, the great powers are steadily working out a system of written law and establishing a judiciary to adjust their differences in accordance with it.

The Current Grouping of Mankind and Nation-making.—In the consolidation of peace one of the most important factors is unquestionably the grouping of mankind in accordance with the final territorial and racial limitations of their apparent destiny. Language has played a vital part in the formation of Germany and Italy. The language question still disturbs the tranquility of the Near East. The Hungarian government is regarded by the Slav, Ruman and German inhabitants of the monarchy as an oppressor for endeavouring to force everybody within the realm to learn the Magyar language. The "Young Turkish" government has problems to face which will be equally difficult, if it insists on endeavouring to institute centralized government in Turkey on the French model.

Whereas during the 19th century states were being cut out to suit the existing distribution of language, in the 20th the tendency seems to be to avoid further encroachment of boundaries, and to complete the homogeneity, thus far attained, by the artificial method of forcing reluctant populations to adopt the language of the predominant or governing race. In the United States this artificial method has become a necessity, to prevent the upgrowth of alien communities, which might at some later date cause domestic trouble of a perilous character. For example, when a community of French Canadians, discontented with British rule, many years ago migrated and settled in Massachusetts, they found none of the tolerance they had been enjoying in Canada for their French schools and the French language they wished to preserve. In Alsace-Lorraine German-speaking immigrants are gradually displacing, under government encouragement, the French-speaking population. Poland is another case of the difficulty of managing a population which speaks a language not that of the governing majority, and Russia, in trying to solve one problem by absorbing Finland into the national system, is burdening herself with another which may work out in centuries of unrest, if not in domestic violence. Not very long ago Pan-Germans were paying much attention to the German settlers in the Brazilian province of Rio Grande do Sul, where large villages spoke nothing but German, and German, as the only language known on the spot, had become the tongue in which municipal business was transacted. The Brazilian government, in view of the danger to which such a state of things might give rise, followed the example of the United States in dealing with the language question.

Thus while in the one case homogeneity of language within state boundaries seems to be one of the conditions making for peace, the avoidance of interference with a well-marked homogenous area like Finland would seem to contribute equally to the same end.

Meanwhile the difficulties in the way of contemporary nation-making are fostered by many extraneous influences, as well as by dogged resistance of the races in question. Not the least important of these influences is the sentimental sympathy felt for those who are supposed to be deprived of the use of their mother-tongue, and who are subjected to the hardship of learning an alien one. The hardship inflicted on those who have to learn a second language is very easily exaggerated, though it is to be regretted that in the case of Hungary the second language is not one more useful for international purposes.

Contemporary Statecraft.—Nation-making has hitherto been more or less unconscious—the outcome of necessity, a natural growth due to the play of circumstance and events. But in our own age conscious statecraft is also at work, as in Canada, where the general of statesmen is gradually endowing that dominion with all the attributes of independence and power. Australia has not learnt the lesson of Canada in vain. Whatever value may attach to the consolidation of the British Empire itself as a factor in spreading the peace which reigns within it, it is also a great contribution to the peace of the world that the British race should have founded practically independent states like the Dominion of Canada, the Commonwealth of Australia, the South African Union and the Dominion of New Zealand. These self-governing colonies with their spheres of influence, with vast areas still unpeopled, have a future before them which is dissociated from the methods of an over-peopled Europe, and among them the preservation of peace is the direct object and condition of their progressive development. Like the United States, they have or will have their Monroe doctrine. Colonized by the steady industrial peoples of northern Europe, there is no danger of the turbulence of the industrially indolent but more passionate peoples of Central and South America. As in Europe, these northern peoples will hold the power which intelligent democracies are consciously absorbing, and the British faculty for statecraft is gradually welding new nations on the British model, without the obsolete traditions and without that human sediment which too frequently chokes the currents of national vitality in the older communities of Europe.

Militarism.—It is often stated, as if it were incontrovertible, that conscription and large standing armies are a menace to peace, and yet, although throughout the civilized world, except in the British Empire and the United States, conscription is the system employed for the recruiting of the national forces of both defence and offence, few of these countries show any particular disposition to make war. The exceptional position of the United States, with a population about equal to that of the rest of the American continent, and of Great Britain, an island state but little exposed to military invasion, places both beyond absolute need of large standing armies, and renders an enlisting system feasible which would be quite inadequate for the recruitment of armies on the French or German scale. Democratic progress on the Continent has, however, absorbed

1 Schemes of thinkers, like William Penn's European Parliament (1693); the Abbé St Pierre's elaboration (c. 1700) of Henry IV.'s "grand design" (see supra); Jeremy Bentham's International Tribunal (1786-1789); Kant's Permanent Congress of Nations and Perpetual Peace (1795); John Stuart Mill's Federal Supreme Court; Seeley's, Bluntschli's, David Dudley Field's, Professor Leone Levi's, Sir Edmund Hornby's co-operative schemes for promoting law and order among nations, have all contributed to popularizing in different countries the idea of a federation of mankind for the preservation of peace.
Conscription as a feature in the equalization of the citizen's rights and liabilities. Just as in Anglo-Saxon lands a national ideal is gradually materializing in the principle of the equalization of chances for all citizens, so in continental Europe, along with this equalization of chances, has still more rapidly developed the ideal of an equalization of obligations, which in turn leads to the claim for an enlargement of political rights co-extensive with the obligations. Thus universal conscription and universal suffrage tend to become in continental political development complementary conditions of the citizen's political being. In Germany, moreover, the military service is designed not only to make the recruit a good soldier, but also to give him a healthy physical, moral and mental training. German statesmen, under the powerful stimulus of the emperor William II., have, in the eyes of some critics, carried this secondary object of conscript training to such excess as to be detrimental to military efficiency. To put it shortly, the Germans have taught their soldiers to think, and not merely to obey. The French, who naturally looked to German methods for inspiration, have come to apply them more particularly in the development of their cavalry and artillery, especially in that of the former, which has taken in the French army an ever higher place as its observing and thinking organ.

Militarism on the Continent has thus become allied with the very factors which made for the reign of reason. No agitation for the development of national defences, no beating of drums to awaken the military spirit, no anti-foreign clamour or invasion panic, no parading of uniforms and futile clash of arms, are necessary to entice the groundling and the bumptkin into the service. In Germany patriotic waving of the flag, as a political method, is directed more especially to the strengthening of imperial, as distinguished from local, patriotism. Where conscription has existed for any appreciable time it has sunk into the national economy, and men do their military service with as little concern as if it were a civil apprenticeship.

As implied above, military training under conscription does not by any means necessarily tend to the promotion of the military spirit. In France, so far from taking this direction, it has resulted, under democratic government and universal suffrage, in a widespread abhorrence of war, and, in fact, has converted the French people from being the most militant into being the most pacific nation in Europe. The fact that every family throughout the land is a contributory to the military forces of the country has made peace a family, and hence a national, ideal. Paradoxical as it may seem, it is the logical conclusion of such comparisons that militarism only exists in countries where there are no citizen armies, and that, where there are citizen armies, they are one of the elements which make for permanent peace.

Normal Nature of Peace.—America has been the pioneer of the view that peace is the normal condition of mankind, and that, when the causes of war are eliminated, war ceases to have a raison d'être. The objects and causes of war are of many kinds. War for fighting's sake, although in the popular mind there may be, during most wars, only the excitement and the emotion of a great gamble, has a place among the motives of those who determine the destinies of peoples. Apart, however, from self-defence, the main causes of war are four: (1) The desire for territorial expansion, due to the overgrowth of population, and insufficiency of the available food-supply; if the necessary territory cannot be obtained by negotiation, conquest becomes the only alternative to emigration to foreign lands. (2) The prompting of national ambition or a desire to wipe out the record of a humiliating defeat. (3) Ambitious potentates again may seek to deflect popular tendencies into channels more satisfactory for their dynasty. (4) Nations, on the other hand, may grow jealous of each other's commercial success or material power. In many cases the apparent cause may be of a nobler character, but historians have seldom been content to accept the allegations of those who have claimed to carry on war from disinterested motives.

On the American continent South and Central American states have had many wars, and the disastrous effects of them not only in retarding their own development, but in impairing their national credit, have led to earnest endeavours on the part of their leading statesmen to arrive at such an understanding as will banish from their international policy all excuses for resorting to armed conflicts. In 1882 Mr Blaine, then U.S. secretary of state, addressed an instruction to the ministers of the United States of America accredited to the various Central and South American nations, directing them to invite the governments of these countries to participate in a congress, to be held at Washington in 1882, "for the purpose of considering and discussing the methods of preventing war between the nations of America." Owing to different circumstances the conference was delayed till the autumn of 1889. At this conference a plan of arbitration was drawn up, under which arbitration was made obligatory in all controversies whatever their origin, with the single exception that it should not apply where, in the judgment of any one of the nations involved in the controversy, its national independence was imperilled, and even in this case arbitration, though optional for the nation so judging, was to be obligatory for the adversary power. At the second International Conference of American States, which sat in the city of Mexico from the 22nd of October 1901 to the 31st of January 1902, the same subject was again discussed, and a scheme was finally adopted as a compromise which conferred authority on the government of Mexico to ascertain the views of the different governments represented in the conference, regarding the most advanced form in which a general arbitration convention could be drawn up that would meet with the approval and secure ratification by all the countries represented, and afterwards to prepare a plan for such a general treaty. The third Pan-American Conference was held in the months of July and August 1906, and was attended by the United States, Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, the Dominican Republic, Ecuador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador and Uruguay. Only Haiti and Venezuela were absent. The conference, being held only a year before the time fixed for the second Hague Conference, applied itself mainly to the question of the extent to which force might be used for the collection of pecuniary claims against defaulting governments, and the forwarding of the principle of arbitration under the Hague Conventions. The possible causes of war on the American continent had meanwhile been considerably reduced. Different states had adjusted their frontiers, Great Britain in British Guiana had settled an outstanding question with Venezuela, France in French Guiana another with Brazil, Great Britain in Newfoundland had removed time-honoured grievances with France, Great Britain in Canada others with the United States of America, and now the most difficult kind of international questions which can arise, so far as the American continent is concerned, have been removed from among existing dangers to peace. Among the Southern Republics Argentina and Chile concluded in 1902 a treaty of arbitration, for the settlement of all difficulties without discussion, combined with a disarmament agreement of the same date, to which more ample reference will be made hereafter. Thus in America progress is being rapidly made towards the realization of the idea that war can be superannuated by elimination of its causes and the development of positive methods for the preservation of peace (see Pan-American Conferences).

With the American precedent to inspire him, the emperor Nicolas II. of Russia in 1898 issued his invitation to the powers to hold a similar conference of European states, with a more or less similar object. In 1899 twenty-six states met at the Hague and began the work, which was continued at the second conference in 1907, and furthered by the Maritime Conference of London of 1908-1909. The creation of the Hague Court and of a code of law to be applied by it have further eliminated causes of difference.

These efforts in the two hemispheres are based on the idea
that international differences can be adjusted without war, where the parties are honestly aggrieved. With this adjustment of existing cases the number of possible pretexts for the employment of force is being rapidly diminished.

Peace Procedure under the Hague Conventions.—The Hague Peace Convention of 1907, which re-enacts the essential parts of the earlier one of 1899, sets out five ways of adjusting international conflicts without recourse to war. Firstly, the signatory powers have undertaken to use their best efforts to ensure the pacific settlement of international difficulties. This is a general declaration of intention to lend themselves to the peaceable adjustment of difficulties and employ their diplomacy to this end. Secondly, in case of serious disagreement, diplomacy having failed, they agree to have recourse, as far as circumstances allow, to the good offices or mediation of one or more friendly powers. Thirdly, the signatory powers agree that it shall not be regarded as an unfriendly act if one or more powers, strangers to the dispute, on their own initiative offer their good offices or mediation to the states in disagreement, or even during hostilities, if war has already broken out. Fourthly, the convention recommends that in disputes of an international nature, involving neither national honour nor vital interests, if the parties may not have been able to come to an agreement by means of diplomacy should institute an international commission of inquiry to facilitate a solution of these disputes by an investigation of the facts. Lastly, the high contracting parties have agreed that in questions of a legal nature, and especially in interpretation or application of international conventions, arbitration is recognized as the most effective, and at the same time the most equitable, means of settling disputes which diplomacy has failed to adjust.

Down to 1910 no suggestion of mediation had actually been carried out, but a number of cases of arbitration had been tried by the Hague Court, created by the Hague Peace Convention (see Arbitration, International), and one case, viz. that of the Dogger Bank incident, was submitted to a commission of inquiry, which sat in January 1900.

If Secretary Knox's proposal (see supra) to convert the International Prize Court into a permanently sitting court of arbitration is adopted, a detailed procedure and jurisprudence will no doubt grow out of a continuity which is lacking in the present system, under which the court is recruited from a large panel for each special case. Secretary Knox's idea, as expressed in the identical circular note addressed by him on the 18th of October 1909 to the powers, was to invest the International Prize Court, proposed to be established by the convention of the 18th of October 1907, with the functions of a "court of arbitral justice." The court contemplated by the convention was a court of appeal for reviewing prize decisions of national courts both as to facts and as to the law applied, and, in the exercise of its judicial discretion, not only to confirm in whole or in part the national decision or the contrary, but also to certify its judgment to the national court for enforcement thereof. The adoption of this jurisdiction would have involved a revision of the judicial systems of probably every country accepting it. The United States government therefore proposed that the signatories should insert in the act of ratification a reservation to the effect that no reference should be made to the International Prize Court, in respect of decisions of their national tribunals, should take the form of a direct claim for compensation. This in any case would remove the United States' constitutional objection to the establishment of the proposed court. In connexion with this enabling clause Mr

Secretary Knox also proposed that a further enabling clause be inserted providing that the International Court of Prize be competent to accept jurisdiction in all matters, arising between signatories, submitted to it, the Court to sit at fixed periods every year and to be composed according to the panel which was drawn up at the Hague. This court, which the American government proposed to call a "Court of Arbitral Justice," would take the place of that which it was proposed to institute under Article No. 1 of the Final Act of the conference of 1907. The intention of the Hague draft annexed to the Vienna was to create a permanent court as distinguished from that established in 1899, which, though called permanent, was not so, having to be put together ad hoc as the occasion arose. The new court, if adopted, would hold regular and continuous sessions, consist of the same judges, and pay due heed to the precedents created by its prior decisions. The two courts would have separate spheres of activity, and litigants would practically have the option of submitting their differences to a judicial court which would regard itself as being bound by the letter of the law and by judicial methods or to a special court created ad hoc with a purely arbitrating character.

International Regulator by Treaty.—It seems a truism to say that among the agencies which most effectively tend to the preservation of peace are treaties which regulate the relations of states in their intercourse with other states. Such treaties, however, are of quite recent origin. The first of a comprehensive
character was the general act adopted at the South African Conference at Berlin in 1885, which laid down the principle, which has since become of still wider application, that "any Power which henceforth takes possession of a tract of land on the coast of the African continent outside of its present possessions or which, being hitherto without such possessions, shall acquire them...shall accompany the act relating to it with a notification thereof, addressed to the other Signatory Powers of the present act, in order to enable them, if need be, to make good any claims of their own," and, furthermore, that "the Signatory Powers of the present act recognize the obligation to ensure the establishment of authority in the regions occupied by them on the coasts of the African continent sufficient to protect existing rights, and, as the case may be, freedom of trade and transit under the conditions agreed upon." Under these articles occupation of unoccupied territory to be legal had to be effective. This led to the creation and determination of spheres of influence. By fixing the areas of these spheres of influence rival states in western and central Africa avoided conflicts and preserved their rights until they were able to take a more effective part in their development. The idea of "spheres of influence" has in turn been applied even to more settled and civilized countries, such as China and Persia.

Other cases of regulation by treaty are certain contractual engagements which have been entered into by states for the preservation of the status quo of other states and territories.

The Anglo-Japanese Treaty of the 12th of August 1905 sets out its objects as follows:

1. "The consolidation and maintenance of the general peace in the regions of Eastern Asia and India;
2. The preservation of the common interests of the Powers in China, in peace and war, the principle of respect and the integrity of the Chinese empire, and the principle of equal opportunities for the commerce and industry of all nations in China;
3. The maintenance of the territorial rights of the high contracting parties in the regions of Eastern Asia and of India, and the defence of their special interests in such regions."

It is a treaty for the maintenance of the status quo in certain parts of Asia in which the parties to it have dominant interests. The same principle underlies different other self-denying arrangements and declarations made by the powers with reference to Chinese integrity.

The Treaty of Algeciras is essentially a generalization of the Franco-German agreement of the 28th of September 1905. It by all the powers represented agree to respect the territorial integrity of Morocco, subject to a possible intervention limited to the purpose of preserving order within it.

Differing from these general acts in not being contractual is the Monroe doctrine, which is a policy of ensuring the maintenance of the territorial status quo as regards non-American powers throughout the American continent. If necessary, the leading republics of South and Central America would no doubt, however, further ensure respect for it by treaty.

With these precepts and current instances of tendency to place the territorial relations of the powers on a permanent footing of respect for the existing status quo, it seems possible to go beyond the mere enumeration of principles, and to take a step towards their practical realization, by agreeing to respect the territorial status quo throughout still larger tracts of the world, neutralize them, and thus place them outside the area of possible wars.

A third contractual method of avoiding conflicts of interest has been the signing of agreements for the maintenance of the "open-door." The discussion on the question of the "open-door" in connexion with the Morocco difficulty was useful in calling general public attention once more to the undesirability of allowing any single power to exclude other nations from trading on territory over which it may be called to exercise a protectorate, especially if equality of treatment of foreign trade had been practised by the authority ruling over the territory in question before its practical annexation under the name of protectorate. The habitable parts of the world are a limited area, exclusion from any of which is a diminution of the available markets of the nations excluded. Every power is, therefore, rightfully interested in the prevention of such exclusion.

The United States government in 1899 called attention to the subject as regards China, without, however, going into any question of principle. It thought that danger of international irritation might be removed by each power making a declaration respecting the "sphere of interest" in China to which it laid claim. Lord Salisbury informed Mr Choate that H.M. government were prepared to make a declaration in the sense desired. All the powers concerned eventually subscribed to the declaration proposed by the United States government.

The principle of the "open-door" in fact has already been consistently applied in connexion with certain non-European areas. As these areas are practically the only areas which of late years have come within the scope of European regulation, the time seems to be approaching when the principle may be declared to be of general application. From the point of view of diminishing the possible causes of conflict among nations, the adoption of this principle as one of international contractual obligation would be of great utility. While putting an end to the injustice of exclusion, it would obviously reduce the danger of nations seeking colonial aggrandizement with a view to imposing exclusion, and thus one of the chief temptations to colonial adventure would be eliminated.

In the fourth place, there is the self-denying ordinance against employment of arms for the enforcement of contractual obligations adopted at the Hague Conference of 1907. Under it the high contracting powers have agreed not to have recourse to armed force for the recovery of contractual debts claimed from the government of one country by the government of another country as due to its subjects. The only qualification admitted under the new convention is that it shall not apply when the debtor-state refuses or leaves unanswered an offer of arbitration, or in case of acceptance renders the settlement the terms of arbitration impossible, or, after arbitration, fails to comply with the award. The theory on which this convention is based is known as the Drago theory, having taken a practical form during the administration of Dr L. M. Draghi, when he filled the post of Argentine minister of foreign affairs. The doctrine, however, is not new, having already been enunciated a century before by Alexander Hamilton and reiterated since then by several American statesmen, such as Albert Gallatin, William L. Marcy and F. T. Frelinghuysen, as the view prevailing at Washington during their respective periods of office.

Limitations of Disarmament.—Disarmament, or to speak more correctly, the contractual limitation of armaments, has become, of late years, as much an economic as a humanitarian peace-securing object.

"The maintenance of universal peace and a possible reduction of the excessive armaments which weigh upon all nations, represent, in the present condition of affairs all over the world, the ideal towards which the efforts of all governments should be directed," were the opening words of the Note which the Minister of Foreign Affairs, Count Mouraviev, handed to the diplomatic representatives of the different powers suggesting the first Hague Conference.

"The ever-increasing financial burdens," the Note went on, "strike at the root of public prosperity. The physical and intellectual forces of the people, labour and capital, are diverted for the greater part from their natural application and wasted unproductively. Hundreds of millions are spent in acquiring terrible engines of destruction, which are regarded to-day as the latest inventions of science, but are destined to-morrow to be rendered obsolete by some new discovery. National culture, economic progress and the production of wealth are either paralysed or developed in a wrong direction. Therefore the more the armaments of each power increase the less they answer to the objects aimed at by the governments. Economic disturbances are caused in great measure by this system of excessive armaments; and the constant danger involved in this accumulation of war material renders the armed peace of to-day a crushing
burden more and more difficult for nations to bear. It consequently seems evident that if this situation be prolonged it will inevitably result in the very disaster it is sought to avoid, and the thought of the horrors of which makes every humane mind shudder. It is the supreme duty, therefore, of all states to place some limit on these increasing armaments, and find some means of averting the calamities which threaten the whole world.

A further Note submitted the programme proposed gave more precision to this item, which thereupon took the following form: "An understanding not to increase for a fixed period the present effective of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which even a reduction might be effected in future in the forces and budgets above mentioned."

When the subject came on for discussion at the conference the German military delegate stated his view that the question of effective could not be discussed by itself, as there were many others to which it was in some measure subordinate, such, for instance, as the length of service, the number of cadres whether existing in peace or made ready for war, the amount of training received by reserves, the situation of the country itself, and the number and position of the fortresses. In a modern army all these questions went together, and national defence included them all. In Germany, moreover, the military system "did not provide for fixed numbers annually, but increased the numbers each year."

After many expressions of regret at finding no method of giving effect to the proposal, the commission confined itself to recording its opinion that "a further examination of the question by the Powers would prove a great benefit to humanity."

The Conference, however, were unanimous in the adoption of the following resolution:—

"The Conference of opinion that the restriction of military budgets, which are at present a heavy burden on the world, is extremely desirable for the increase of the material and moral welfare of mankind;" and it passed also the following text:—

"That governments, taking into account the proposals made at the Conference, should examine the possibility of an understanding concerning the limitation of military and naval armaments, and of war budgets."

The general public, more particularly in Great Britain and France, shows an ever-increasing distrust of the rapid growth of armaments as a possible cause of grave economic troubles. A high state of military preparedness of any one state obliges all the others to endeavour to be prepared on the same level. This process of emulation, very appropriately called by the late Sir H. Campbell-Bannerman "a policy of huge armaments," unfortunately is a policy from which it is impossible for any country to extricate itself without the co-operation, direct or indirect, of other nations.

The subject was brought forward in view of the second Hague Conference in both the French and Italian parliaments.

The declaration of the French government stated that:—

"France hoped that other nations would grow, as she had done, more and more attached to solutions of international difficulties based upon the respect of justice, and she trusted that the progress of universal opinion in this direction would enable nations to regard the greatly increased present military budgets, declared by the states represented at the Hague to be greatly desirable for the benefit of the material and moral state of humanity, as a practical possibility." (Chamber of Deputies, June 12, 1906.)

In the Italian Chamber of Deputies, an interpellation was addressed to the minister of foreign affairs about the same time asking "whether the Government had knowledge of the motion approved by the British House of Commons, and of the undertaking of the British government that, in the programme of the coming Hague Conference, the question of the reduction of armaments should be inserted, and in what spirit the Italian government had taken or proposed to take the propositions of the British government, and what instructions it would give to the Italian representatives at the conference."
time for the exclusion of war is neutralization. We have been dealing hitherto with the elimination of the causes of war: neutralization is a curtailment of the areas of war and of the factors in warfare, of territory on the one hand and states on the other. The neutralization of territory belonging to states which are not otherwise neutralized includes the neutralization of waterways such as the Suez and Panama canals.

Under the General Act of Berlin of the 26th of February 1885, "in case a power exercising rights of sovereignty or protectorate" in any of the regions forming the basin of the Congo and its affluents, including Lake Tanganyika, and extending away to the Indian Ocean, should be involved in a war, the parties to the General Act bound themselves to lend their good offices in order that the territories belonging to this power be placed during the war "under the rule of neutrality and considered as belonging to a neutral state, the belligerents thenceforth abstaining from extending hostilities to the territories thus neutralized, and from using them as a basis for warlike operations" (art. 2).

Neutralization is not necessarily of general application. Thus two states can agree to neutralize specific territory as between them. For example between Costa Rica and Nicaragua by a treaty of the 15th of April 1858 the parties agreed that "on no account whatever, not even in case of war," should "any act of hostility be allowed between them in the port of San Juan del Norte nor on the river of that name nor on Lake Nicaragua." (art. 2).

Again, the Straits of Magellan are neutralized as between Argentina and Chile under a treaty of the 23rd of July 1851. Article 5 provides that they are "neutralized for ever and their free navigation is guaranteed to the flags of all nations. To ensure this neutrality and freedom it is agreed that no fortifications or military defences which might interfere therewith shall be erected."

Luxemburg was declared by the Treaty of London of the 11th of May 1867 (art. 1) to be a perpetually neutral state under the guarantee of Great Britain, Austria, Prussia and Russia. Switzerland, by a declaration confirmed by the Treaty of Vienna, of 1815 (art. 84), likewise enjoys perpetual neutrality. And now Norway has placed herself under a neutral régime of a similar character.

A neutralized state does not mean a state which is forbidden to have fortifications or an army; in this it differs from neutralized territory of a state not otherwise neutralized. Thus Belgium, which is a neutralized state, not only has an army but has fortifications, although by the treaties of 1831 and 1839 she was recognized as a "perpetually neutral state, bound to observe the same neutrality with reference to other states."

Of waterways, international rivers have been the chief subject of neutralization. It has long been an established principle in the intercourse of nations, that where the navigable parts of a river pass through different countries their navigation is free to all. The rivers Scheldt and Meuse were opened up in this way to riparian states by a decree of the French Convention of the 16th of November 1792. By the treaty of Vienna of the 6th of June 1815, the powers whose territories were separated or traversed by the same navigable river, undertook to regulate by common consent all that regarded its navigation, and for this purpose to name commissioners who should adopt as the bases of their proceedings the principle that the navigation of such rivers along their whole course "from the point where each of them becomes navigable to its mouth, shall be entirely free, and shall not in respect of commerce be prohibited to anyone." The only case in Europe in which this internationalization of rivers has been maintained is that of the Danube. On the other hand neutralization has made progress in respect of waterways,

1 Under the treaty of the 29th of March 1864, the courts of Great Britain, France and Russia in their character of guaranteeing powers of Greece declared with the assent of the courts of Austria and Prussia that the islands of Corfu and Paxo as well as their dependencies should, after their union to the Hellenic kingdom, enjoy the advantages of perpetual neutrality, and the king of the Hellenes undertook on his part to maintain such neutrality. (Art. 2).

natural as well as artificial. Thus the Bosphoras and Dardanelles under the Treaty of Paris of 1856 and by the Treaty of London 1871 were and remain closed to the passage of foreign armed vessels in time of war, though the Porte may permit their passage in time of peace in certain cases. The Suez and the Panama canals have been permanently neutralized, the former by a convention among the great powers, and the latter by a treaty between Great Britain and the United States.

Alongside this neutralization has grown up a collateral institution, the purpose of which is in some respects similar. We refer to "buffer" zones. "Buffer" zones are of quite recent origin as a political creation, i.e. where their object is to establish upon the territory of two contiguous states a strip or zone on either side of the frontier which the respective states agree to regard as neutral, on which the parties undertake to erect no fortifications, and maintain no armed forces but those necessary to enforce the ordinary respect of government. The word "neutral" does not correctly describe the character of the zone. It is not neutral in the sense of being recognized as such by any third state, and it necessarily ceases to be neutral in certain circumstances, for the "buffer" zone becomes nearest to the object, but even this term implies more than is meant. Between Spain and Morocco a treaty of the 5th of March 1894 established between the Camp of Melilla and Moroccan territory a zone within which no new roads were to be made, no herds to be allowed to graze, no land to be cultivated, no troops of either party, or even private persons carrying arms, to set foot, no inhabitants to dwell, and all habitations to be razed. The zone between Burma and Siam, established by an agreement between Great Britain and France dated the 15th of January 1896, declared the portion of Siam which is comprised within the drainage basin of the Menam, and of the coast streams of a corresponding longitude, neutral as between them. Within this area the two powers undertook not to operate by their military or naval forces, except in so far as they might do so in concert for any purpose requisite for maintaining the independence of Siam. They also undertook not to acquire within that area any privileges or commercial facilities not extended to both of them.

"Buffer" zones might fulfil a useful purpose even in Europe. They would obviously react against the feeling known as "esprit de frontière," and diminish the danger of incidents arising out of this feeling, and might attenuate the rivalry of neighbouring counter-armaments.

These considerations no doubt led the Swedish and Norwegian governments, in their settlement of September 1905, to establish a "buffer" zone of 15 kilometres on either side of the frontier between the two states in question. Within these 30 kilometres all existing fortresses are dismantled, no new ones are to be erected, and no armed troops to be maintained; any question between the two states relative to the provisions respecting the "buffer" zone to be decided by arbitration.

A rather special case of neutralization of a territorial area

1 The institution of "buffer" zones in a more strictly correct sense of the term is of very ancient origin. One is mentioned in the annals of China two centuries before our era, between the territories of the Romans and the Parthians. The Eastern Romans and Germans protected themselves in this way. In the middle ages the Teutonic Order established a frontier belt on the side of Lithuania. Later, Austria dealt in the same way in her policy in regard to Turkey in the organization of a "military frontier." See Nys, Droit International (Brussels, 1904), p. 118.

2 It was stipulated that the dismantling should be controlled by a technical commission of three officers of foreign nationality, to be chosen, one by each of the contracting powers and the third by the two officers thus appointed, or, in default of an agreement on their part, by the president of the Swiss Confederation. The dismantling of the forts in question has now been carried out. The Commission was composed on the part of Sweden of an engineer on the staff of the Austrian army, and on the part of Norway of a colonel in the German army, and, by agreement of these, of a colonel in the Dutch army.
is that of the practical neutralization of the Great Lakes in America. In 1817, at the instance of John Quincy Adams, the United States and Great Britain entered into a compact whereby the Great Lakes, and the waterways from them to the ocean by the St Lawrence river, which divide the United States from the Dominion of Canada, were practically excluded from any possible hostilities. Through a simple agreement, conditions which make for peace and prosperity, and the absence of those which so often lead to disastrous war, have for nearly a century reigned over these great inland waters, whose commerce, conducted for the benefit of the states and nations of Europe and America, rivals that which passes through the Suez Canal or over the Mediterranean Sea, and with a result foreshadowed in the Senate commending the proposed agreement: *In order to avoid collision and save expense.*

Fort which had been erected at salient points on either side of the lakes and rivers dividing the United States from Canada, which but for this agreement would, in the natural course of events, have been enlarged, increasingly garrisoned, and provided with modern implements of destruction, at large expense, have remained substantially as when the agreement was made, or now constitute but interesting curiosities. Nevertheless, a neutral power in the event of constructing and maintaining, through a long series of years, naval armaments of ever-increasing power has been avoided.

As we have already said, the Monroe doctrine is a means of excluding European warfare from the American continent and therefore is in the nature of a form of neutralization. A sort of Monroe doctrine is growing into popular favour also throughout the Australian Commonwealth, where it is felt that a continent so far removed from European rivalries ought not to be exposed to complications on account of them.

From time to time questions of adding to existing neutralized areas are raised. When it was announced in 1905 that a British fleet was about to manœuvre in the Baltic Sea, several German newspapers suggested that Germany should combine with other Baltic powers to assure its neutralization. No official observation on the subject, however, was made on the part of any Baltic power. The Baltic is still an open sea for the whole world, without restriction of any kind; and even hostilities between any two non-Baltic powers could be carried on in the Baltic, as elsewhere on the high seas, under the existing practice. When the Germanemannink incident occurred, the possibility of operations of war being carried on far afield, miles of British home ports, and amid the busy traffic of the North Sea, was brought vividly home to British minds.

A movement set on foot at the instance of Edward Atkinson, the well-known Boston economist, and warmly supported by the Massachusetts State Board of Trade, seeks to establish by treaty neutral zones from the ports of North America to the ports of Great Britain and Ireland and the continent of Europe, within which zones steamship and sailing vessels in the conduct of lawful commerce should be free to pass without seizure or interruption in time of war. There is however no precedent of neutralization of any such area of the high sea, and international rivers, ocean canals and neutralized states are obviously no criterion in discussing a proposal to neutralize a strip of the ocean, which may be defined accurately enough on the map and which skilful navigators could approximately determine, but which might be violated without any practical means of detection by a belligerent commander whenever he mistook, or if it suited him to misread, his bearings.

The principle of neutralization is that of guaranteeing the integrity of states. Several such guarantees have been given in quite recent times. In November 1907 a treaty was concluded between France, Germany, Great Britain and Russia on the one part and Norway on the other, for the maintenance of the integrity of Norway. This treaty differed from the older one of 1855 in which France and Great Britain guaranteed the integrity of Norway and Sweden, in the fact that whereas the older treaty was for the protection of these two states against Russia, the new treaty is intended, if it is to serve at all as a protection against invasion, to protect Norway against Sweden.

Another such guarantee of a vaguer character is that which the North Sea powers recently entered into for the maintenance of the status quo of their respective North Sea territories; and the similar one entered into by the Mediterranean powers for the same objects in the Mediterranean. Lastly in the same order of ideas Austria-Hungary and Russia are said to have concluded an arrangement between them for the maintenance of the status quo in the Balkans.

The future has no doubt still other extensions of the principle of neutralization in store for us. Not the least interesting of existing possibilities is the limitation of the area of visit and search in time of war itself, as a restriction of belligerent right. It seems contrary to common sense that neutral ships should be exposed to being detained, taken out of their course, and overhauled on mere suspicion of carrying contraband, when they are so far from the seat of war that there can be no presumption as to their being involved. Of the Monroe doctrine a sort of neutralization of their ordinary business unmolested in so far as they do nothing to assist either belligerent. When they are beyond a certain distance from the seat of war it seems reasonable that the presumption that they are merely carrying on their legitimate business should be considered absolute. Such a limitation of the area of hostilities is not only feasible, but it was actually put in practice by the British government during the Boer War.

In the course of the Russo-Japanese War the question came up again, being raised this time by Great Britain. Lord Lansdowne called the attention of the Russian foreign office to the extreme inconvenience to neutral commerce of the Russian search for contraband not only in the proximity of the scene of war, but over all the world, and especially at places at which neutral commerce could be most effectually intercepted. H.M. Government had become aware that a large addition was likely to be made to the number of Russian cruisers employed in this manner, and they had, therefore, to contemplate the possibility that such vessels would shortly be found patrolling the narrow seas which lie on the route from Great Britain to Japan in such manner as to render it virtually impossible for any neutral vessel to escape their attention. The effect of such suppression of neutral trade, he said, would be disastrous to legitimate commerce passing from a British port in the United Kingdom to a British port in the Far East. The British government had no desire to place obstacles in the way of a belligerent desiring to take reasonable precautions in order to prevent the enemy from receiving supplies, but they insisted that the right of taking such precautions did not imply a "consequential right to intercept at any distance from the scene of operations and without proof that the supplies in question were really destined for use of the enemy's forces, any articles which that belligerent might determine to regard as contraband of war."

1 Memorial of Massachusetts State Board of Trade (Feb. 13, 1905).
2 This was merely reviving an idea which had come and gone many times before. See Barclay, Problems of International Practice and Diplomacy (1907).
3 In January 1900 it was reported that the British government had issued instructions to British naval commanders not to stop or search German merchant vessels at any places not in the vicinity of the seat of war. There is no proper statement of the British position on this subject, the only official information having been given by the German chancellor in a speech in the Reichstag. According to this information, the area was ultimately limited as north of Aden, and afterwards it was agreed that the immunity from search should be extended to all places beyond a distance of 50 miles from the seat of war equal to the distance from it of Aden. This was substantially correct, though the telegrams sent by the Admiralty can hardly be said to have fixed any precise area. As a fact, the commanders-in-chief on the East Indies and Cape of Good Hope suggested additional instructions in consequence of the great practical difficulty of proving—at ports so remote from the scene of war operations as Aden and Perim—the real destination of contraband of war carried by vessels visiting those parts, directions were to be given to the officers concerned to cease to search such vessels, and to merely report to the commander-in-chief at the Cape the names of ships suspected of carrying contraband, and the date of clearance.
The position thus assumed is not clear. On the one hand the British claim did not, it is seen, go the length of the restriction Great Britain consented to place on her own right of search during the Boxer War, seeming to apply only to the case of ships carrying contraband. On the other, the complaint is based on the “interference” with neutral trade, which means the stoppage and search of vessels to ascertain whether they have contraband of any kind on board or not.

It must not be forgotten in this connexion that restriction of the rights of the belligerent necessarily entails extension of the duties of the neutral. The belligerent has an unqualified right to “interfere” with all neutral vessels navigating in the direction of the seat of war, for the purpose of ascertaining whether they are carrying any kind of contraband or not. Under the Declaration of London of the 26th of February 1909 it is provided under arts. 32 and 35 that a ship’s papers are conclusive proof as to the voyage on which she is engaged unless she is clearly out of the course indicated by her papers and is unable to give adequate reasons to justify her deviation. Thus the interference, if the declaration is ratified, will be confined to an examination of the ship’s papers where the ship is not bound for a belligerent port (cf. art. 30 of the same convention).

Standing Peace Agreements.—Foremost among standing peace agreements are, of course, the International Hague Conventions relating directly to peace, agreements which have not only created a special peace jurisdiction for the settlement of international difficulties but judicial methods by also written laws to apply within the scope of this jurisdiction.

Alongside the Hague Peace Conventions and more or less connected with them are standing treaties of arbitration which have been entered into by different nations for terms of years separately. The first of which may be called a new series was that between Great Britain and France. It has now been followed by over a hundred others forming a network of international relationships which shows that, at any rate, the wish for peace is universal among mankind.1

1 The following list of standing arbitration treaties concluded after the signing of the Anglo-French treaty of October 14th 1903 is as complete as possible down to June 1910:—

Argentina—Brazil, September 7, 1905.
.. Portugal, August 27, 1909.
Austria-Hungary—Switzerland, December 3, 1904.
Belgium—Denmark, April 26, 1905.
.. Greece, May 2, 1905.
.. Norway and Sweden, November 30, 1904.
.. Rumania, May 27, 1905.
.. Russia, October 30, 1904.
.. Spain, January 23, 1905.
.. Switzerland, November 15, 1904.
Brazil—Portugal, March 25, 1909.
.. Spain, April 8, 1909.
.. Mexico, April 11, 1909.
.. Honduras, April 26, 1909.
.. Venezuela, April 30, 1909.
.. Panama, May 1, 1909.
.. Ecuador, May 13, 1909.
.. Costa Rica, May 18, 1909.
.. Cuba, June 19, 1909.
.. Bolivia, June 25, 1909.
.. Nicaragua, June 28, 1909.
.. Norway, July 13, 1909.
.. China, August 3, 1909.
.. Salvador, September 3, 1909.
.. Peru, December 7, 1909.
.. Sweden, December 14, 1909.
Colombia—Peru, September 12, 1905.

There are, however, a large number of conventions which, although not concluded with the direct object of assuring peace where difficulties have arisen, tend in a very practical manner to control the minor difficulties. These are conventions for the regulation of intercourse between the subjects and citizens of different states. Such conventions obviously remove occasions for friction and are therefore among the most effective agencies contributing to the preservation of peace among civilized peoples. In most cases such conventions have created international unions of states for all matters which lend themselves to international co-operation. The first in order of date was the postal union. The system it inaugurated has now extended its scope to telegraphs, copyright, industrial property, railway traffic, the publication of customs tariffs, metric measures, monetary systems and agriculture. Berne, being the capital of the most central of the neutral European states, is the administrative centre of most of these unions. Customs tariffs and the monetary unions, however, are centralized at Brussels, Switzerland, December 14, 1904.

the weights and measures union in Paris and the agricultural institute at Rome.

The general postal union was created by a convention signed at Berne in 1874. A convention for a similar union for telegraphs was signed in Paris in 1875 (revised at St Petersburg and replaced by another the same year). Both unions issue monthly bulletins and other publications giving useful information about these two services.

The international bureau of weights and measures at Paris was created by a convention signed there in 1875, for the purpose of comparing and verifying weights and measures on the metric system, and preserving their identity for the contracting states.

The double-standard Latin union monetary system was founded by a convention of 1865; between Belgium, France, Italy and Switzerland. In 1868 it was joined by Greece. A single standard union exists between Sweden, Norway and Denmark under a convention of 1873.

The copyright union was created by an international convention signed in 1874. The official bureau of the union is at Berne. It issues a periodical publication called Le Droit d'auteur giving information respecting the laws of different states relating to published matter of all kinds.

The term “industrial property” covers patents, trade marks, merchandise marks, trade names, designs and models. The convention dealing with them signed in 1883 created a union with its central office at Berne. It, too, issues a bulletin and other publications which help to prevent misunderstandings.

The railway traffic union was formed by a convention of 1880. The central bureau at Berne issues a monthly bulletin. A subsequent convention was signed at Berne in 1886 relating to matters of technical unification.

A subsidiary convention not quite falling within the scope of the above by convention is the submarine telegraphs convention, which was signed in 1884. It applies outside territorial waters to all legally established submarine cables landed on the territories, colonies or possessions of one or more of the high contracting parties. In the event of the infringement of the latter, it is a punishable offence to break or injure a submarine cable willfully or by culpable negligence in such manner as might interrupt or obstruct telegraphic communication either wholly or partially, such punishment being without prejudice to any civil action for damages. It also provides that vessels engaged in laying or repairing submarine cables shall conform to the regulations as to signals which have been, or may be, adopted by mutual agreement among the high contracting parties. In all cases where any persons or vessels are under the necessity of laying or repairing a cable, the ship engaged in repairing a cable exhibits the said signals, other vessels which see them or are able to see them shall withdraw or keep beyond a distance of one nautical mile at least from the ship engaged in repairing the cable, and the ship engaged in repairing the cable may do so at the option of the master of the ship engaged in repairing the cable. Owners of ships or vessels who can prove that they have sacrificed an anchor, net or other fishing-gear in order to avoid injuring a submarine cable shall receive compensation from the owner of the cable engaged in laying it in order to establish a claim to such compensation a statement supported by the evidence of the crew should whenever possible be drawn up immediately after the occurrence and the master must within twenty-four hours after his return to or next putting into port make a declaration to the proper authority (art. 7). “The tribunals competent to take cognizance of infractions of the present convention are those of the country to which the vessel on board of which the offence was committed belongs” (art. 8).

The convention do not in any way restrict the action of belligerents. It may be remarked that the British representative at the time of signing the convention declared that his government understood that the same would be applicable to submarine cables as to naval and military cables. Parliamentary Paper C. 5910: 1890.

Under the convention creating the customs tariffs union, signed in 1890, thirty states, including Great Britain and most British colonies, are associated for the purpose of prompt publication of custom tariffs and their modifications.

The agricultural institute, created by a convention of 1905 with its seat at Rome, as the latest in date is perhaps the most interesting of the series. It shows how deep and widespread the sense of the utility of international state co-operation has become. The convention sets out the scope and objects of the institute, which a recent British official publication states has been joined by 38 states, including Great Britain and all other great powers, as follows:

Whilst limiting its action to international questions, it shall be the task of the institute to obtain methods of settling disputes with as little delay as possible, statistical, technical, or economic information regarding the cultivation of the soil, its productions, whether animal or vegetable, the trade in agricultural products, and the prices obtained on the various markets. (b) To communicate to interested parties, also without delay, full information of the nature above mentioned. (c) To indicate the wages of rural labour.

(d) To notify all new diseases of plants which may appear in any part of the world, indicating the districts affected, the spread of the disease, and, if possible, the efficacious means of resistance. (e) To consider questions relating to agricultural co-operation, insurance and credit, in all their forms, collecting and publishing material which may be useful to the organization of undertakings relating to agricultural co-operation, insurance and credit. (f) To present, if expedient, to the governments, for their approval, measures for the protection of the common interests of agriculturists and for the improvement of their conditions, having care of the obtaining of the necessary information, e.g., resolutions passed by international congresses or other congresses relating to agriculture or to sciences applied to agriculture, agricultural societies, academies, learned societies, &c., &c.

All questions relating to the economic interests, the legislation and administration of any particular state, must be excluded from the sphere of the institute. (Art. 9).

Lastly, there is a class of difficulties which might arise from preferential treatment of trade from different countries. To obviate these statesmen have been led to adopt the principle of the most-favoured-nation—clause—that is to say, a clause providing that if any reductions of tariff or other advantages are granted by either contracting state to any third state, the others shall have the benefit of it. In Europe this clause has been uniformly treated as applying to all reductions of tariff without distinction. The United States interpretation, on the other hand, distinguishes between reductions of a general character and reductions made specifically in return for reductions by some other state. The latter do not come within the operation of the clause, and a co-contracting state is only entitled to obtain extension of them to itself on granting similar concessions. In other words, concessions to any co-contracting state are only allowed gratuitously to a third co-contracting state when nothing has been given for them, the clause not covering advantages granted in return for advantages. It is to be hoped that this special view of the meaning of the clause will be met in the future, as in some recent treaties, by specifically dealing with the exceptions.

The Utility of Popular Effort.—Until quite recently it had been a distinctive mark of practical wisdom to treat private efforts for the improvement of international relations for the preservation of peace, with the patronizing tolerance of courteous people of the world extend to half-crazy idealists. Since the opening of the century, an immense change has taken place in the attitude of the leaders of popular opinion towards the advocacy of peace. This new attitude has been contemporary with the greater interest displayed by the mercantile classes of England and the United States in the improvement of their political relations with their neighbours. It may be said to have begun with the visit of the Association of British Chambers of Commerce to Paris in 1881 at the time when France was recovering from the humiliations of the Facoshe and, the Boer War, exciting hostile demonstrations against Great Britain throughout the continent of Europe. That some four hundred British manufacturers

See, Barclay, Problems of International Practice and Diplomacy (1907), p. 137 seq.
and merchants, representing about eighty chambers of commerce of the United Kingdom, should have swelt aside all political objections and have boldly trusted to the efficacy of friendly advances as between man and man, appealed to the French people. It seems to have been the first great popular effort ever made deliberately by a representative body of the middle class of a nation for the promotion of international friendship without the aid of diplomacy and without official assistance or even countenance of any kind.

Otherwise, private agencies of a standing character which contribute towards the promotion of peace may be divided into four classes, viz. (1) those which, without having peace for their direct object, promote friendship among men of different races and nationalities; (2) those which directly address themselves to the promoting of friendship and goodwill among peoples; (3) those which regarding peace as the immediate object of their efforts, endeavour to educate democracy in this sense; (4) those which endeavour to remove the causes of international friction by the codification of international law and the promotion of the international regulation of common interests. Lastly, there are two agencies which cannot be classed among the foregoing; one, the International Parliamentary Union and the other the Nobel Prize Committee.

1. Agencies which are indirectly making for peace are of many kinds. Science and medicine now bring men of all nations together in periodical congresses. Technology, electricity, mining, railways, navigation and many other subjects are now dealt with in international congresses. International exhibitions are always used as an occasion for holding many such meetings.

2. One of the most notable efforts directed to the deliberate cementing of friendship has been the interchange of official visits by municipal bodies. In the course of the Anglo-French agitation which culminated in March 1903 with the visit of King Edward to Paris, the French municipal councils passed many resolutions in favour of the entente. After the conclusion of the Anglo-French standing treaty of arbitration (Oct. 14, 1903) and the arrangements for the general settlement of outstanding difficulties with France (April 8, 1904), the municipal bodies in France were prepared to go a step farther, and in 1906 the Municipal Council of Paris was invited by the London County Council to pay the same visit to London. This visit was followed by a return visit to Paris and a similar exchange of visits between the London City Corporation and the Paris Municipal Council, exchange visits of the city corporations of Manchester, Glasgow and Edinburgh and Lyons, and a visit of the Manchester Corporation to Düsseldorf, Barmen and Cologne. A society, numbering many thousands of working men among its members, which has set itself the more special task of promoting the interchange of visits between working men of different nations, is called the "International Brotherhood Alliance," or, after the initials of its motto, Fraternités inter gentes, the F.I.G. Another agency, called the "American Association for International Conciliation," seeks by the publication of essays on the different aspects of international friendship to promote the same cause.

3. The "peace societies," which are scattered over the whole world, number several hundreds. Their first International Congress was held in London at the suggestion of Joseph Sturge in 1843. In 1848 a second congress was held at Brussels. The third in 1849 took place in Paris, and was presided over by Victor Hugo. Other congresses were held at Frankfurt, again in London, and in 1853 at Manchester, where Richard Cobden and John Bright took part in the discussions. Then followed an interval of wars during which the Pacifists were unable to raise their voices. At length in 1878 a congress was held at the Paris International Exhibition of that year, but it was not till the next Paris International Exhibition of 1889 that these international peace congresses became periodical. Since then numerous congresses have been held, the seventeenth having sat in London in 1908, and the eighteenth at Stockholm in 1910. These congresses have been supplemented by national congresses in both Great Britain and France. Such congresses are doing admirable work in the popularizing of thought upon the numerous questions which are discussed at the meetings, such as compulsory arbitration, the restriction of armaments, private property at sea in time of war, the position of subject races, airships in war, &c.

4. First among the bodies which try to remove the causes of international friction is the Institute of International Law. This is a body of international lawyers, consisting of sixty members and sixty associates recruited by election—the members from those who "have rendered services to international law in the domain of theory or practice," and associates from those "whose knowledge may be useful to the Institute." It was formed in 1873, chiefly through the efforts of M. Rolin-Jacquemyns. The official language of the Institute is French, and its annual meetings are held wherever the members at the previous meeting decide to assemble. Its mode of operation is to work out the matters it deals with during the intervals between the sessions, in permanent commissions, among which the whole domain of international law is divided up. The commissions, under the direction of their rapporteurs or conveners, prepare reports and proposals, which are printed and distributed among the members from time to time. Before the plenary meetings they are to be discussed. If the members are not agreed, the subject is adjourned to another session, and still another, until they do agree. Thus the resolutions of the Institute have the authority attaching to a mature expression of the views of the leading international jurists of Europe. Another body having a more or less similar purpose is the International Law Association, which was founded in 1873 as the "Association for the Reform and Codification of the Law of Nations," with practically the same objects as those which led to the constitution of the Institute of International Law. It also meets in different countries, but it differs from the Institute in the number of its members being unlimited and in all respectable persons being eligible for membership. A report is published after each meeting. There are now numerous volumes of such reports, many of them containing most valuable materials for international jurists. In 1895 the name was changed to International Law Association.

A new society was recently (1906) formed in America called the American Society of International Law, "to foster the study of international law, to advance and to publish works of instruction relating on the basis of law and justice." "Membership in the society is not restricted to lawyers, and any man of good moral character interested in the objects of the society may be admitted to membership." The publications of this society have already taken an important place among the literature of international law.

Still more recently yet another society came into being in Switzerland with objects which seem to be similar to those of the Institute of International Law.

The Inter-Parliamentary Union, which dates back to 1887, owes its origin to the initiative of the late Sir W. R. Cremer. It is composed of groups of the different parliaments of the world, who meet periodically to "bring about the acceptance in their respective countries, by votes in parliament and by means of arbitration treaties, of the principle that differences between nations should be submitted to arbitration and to consider other questions of international importance." The sixteenth conference was held at Brussels in August—September, 1910.

1. At the third congress of the new series, held at Rome in 1891, was created the Bureau International de la Paix. This most useful institution not only has its offices at Bern, but serves as a means of bringing and keeping together all the known peace societies. Its Correspondence bimensuelle and Annuaire du mouvement pacifique are well known, and its obliging hon. secretary, Dr A. Gobat, is always ready to supply information from the now considerable archives of the Bureau. In this connexion we may mention that the secretary of the London Peace Society, Dr Evans Darby, has edited an exhaustive collection of materials called International Tribunals. His statements every two years on the progress of arbitration at the International Law Association meetings also form an excellent source of materials for reference.

2. Art. 1 of Statutes revised Sept. 1908.

See Annuaire du mouvement pacifique pour l'année 1910, published by the Bureau International de la Paix, at Bern.
The Nobel Committee owes its existence to the will of the late Alfred B. Nobel (1833-1896), the inventor of dynamite, who left a considerable fortune for the encouragement of science who work for the betterment of mankind. The inheritance of this money was to be divided into five equal parts, to be distributed every year as rewards to the persons who had deserved best of mankind in five departments of human activity. The clauses of the will governing the distribution of these prizes are as follows:

"The entire sum shall be divided into five equal parts, one to go to the man who shall have made the most important discovery or invention in the domain of physical sciences; another to the man who shall have enrolled his name with the highest honour in the domain of chemistry; another to the man who shall have done the greatest improvement in medicine; the third to the man of the most important discovery in the domain of physiology or medicine; the fourth to the man who shall have produced the most noble work of an idealistic nature; and, finally, the fifth to the man who shall have done the most or best work for the fraternity of nations, the suppression or reduction of standing armies, and the formation and propagation of peace congresses. The prizes shall be awarded as follows: For physical science and chemistry, by the Swedish Academy of Sciences; for physiological or medical work, by the Caroline Institution at Stockholm; for literature, by the Stockholm Academy, and for peace work, by a committee of five members elected by the Norwegian Storting. It is expressly declared that in awarding the prizes, no account shall be taken of nationality, in order that the prize may fall to the lot of the most deserving, whether he be Scandinavian or not."

Peace v. War.—Peace is the ultimate object of all statecraft—peace in the development of the domestic activities of the nation administered, and peace in the relations of states with one another. For the purpose of ensuring peace an expensive diplomacy is maintained by all states, and to perpetuate it treaties are entered into by states with one another. Even war has its ends, though the ultimate object is pacifying specific international relations on a definite footing. Ultimate peace is uniformly proclaimed by every dictator at home, by every conqueror abroad, as the goal to which he is directing his efforts. And yet dissident voices are sometimes heard defending war as if it were an end in itself. Without going back to the well-known reply of Count Moltke to Professor Bluntschli respecting the Manual of the Laws of War drawn up by the Institute of International Law in 1886, we need only quote that highly up-to-date philosopher, Nietzsche: "It is mere illusion and prettiness," he observes, "to expect much (even anything at all) from mankind if it forgets how to make war. As yet no means are known which call so much into action as a great war, that rough energy born of the camp, that deep impersonality born of hatred, that conscience born of murder and cold-bloodedness, that force of instinct born of the adoration of the devil, that indifference to loss, to one's own existence, to that of one's fellows, to that earthquake-like soul-shaking which a people needs when it is losing its vitality."

It is pleasant to contrast this morbid joy of one onlooker with the matter-of-fact reflections of another, the late W. E. H. Lecky. "War" he says "is not, and never can be a mere passionless discharge of a painful duty. It is in its essence, and it is a main condition of its success, to kindle into fierce exercise among great masses of men the destructive and combative passions—passions as fierce and as malevolent as that with which the hound hunts the fox to its death or the tiger springs upon its prey. Destruction is one of its chief ends. Deception is one of its chief means, and one of the great arts of skilful generalship is to deceive in order to destroy. Whatever other elements may mingle with and dignify war, this at least is never absent, and however remote the men may enter into war, however conscientiously they may endeavour to avoid it, they must know that when the scene of carnage has once opened, these things must be not only accepted and condoned, but stimulated, encouraged and applauded. It would be difficult to conceive a disposition more remote from the morals of ordinary life, not to speak of Christian ideals, than that with which the soldier is animated by the fire and passion that lead to victory rush forward to bayonet the foe.... It is allowable to deceive an enemy by fabricated despatches purporting to come from his own side; by tampering with telegraph messages; by spreading false intelligence in newspapers; by sending pretended spies and deserters to give him untrue reports of the numbers or movements of the troops; by employing false signals to lure him into an ambuscade. On the use of the flag and uniform of an enemy for purposes of deception there has been some controversy, but it is supported by high military authority."

Hardly any one will be so confident of the virtue of his rulers as to believe that every war which his country wages in every part of its dominions with uncivilized as well as civilized populations, is just and necessary, and it is certainly prima facie not in accordance with an ideal morality that men should bind themselves absolutely for life or for a term of years to kill without question, at the command of their superiors, those who have personally done them no wrong.

Surely with all the existing activity in the removal of causes of war, in the reduction to precise expression of the rules of law governing the relations of states with one another, in the creation of international judicatories for the application of these rules, in the concluding of treaties specifically framed to facilitate the pacific settlement of difficulties diplomacy may have failed to adjust, in the promotion of democratic civilian armies with everything to lose by war, and all the other agencies which have been described above, the hope seems warranted that, in no distant future, life among nations will become still more closely assimilated to life among citizens of the same nation, with legislation, administration, reform all tending to the one great object of law, order and peace among men. (T. Ba.)

Peace, Breach of the Peace. Theoretically all criminal offences cognizable by English law involve a breach of the king's peace, and all indictments whether for offences against the common law or by statute conclude "against the peace of our lord the king, his crown and dignity." Historically this phrase, now legally superfluous, represents the last trace of the process by which the royal courts assume jurisdiction over all offences, and gradually extruded the jurisdiction of the sheriff and of lords of manors and franchises, making crime a matter of national concern as distinguished from civil wrongs or infractions of the rights of local magnates, or of the rights of the tribal chiefs of the Teutonic conquerors of Britain. The peace of the king was sworn on his accession or full recognition, and the jurisdiction of his courts to punish all violations of that peace was gradually asserted. The completion of this process is marked by the institution of the office of justice of the peace.

In modern times the expression "breach of the peace" is usually limited to offences involving actual tumult, disturbances and disorder. As regards such offences, although they do not fall into the class of grave crimes described as felonies, officers of police and even private persons have greater powers and duties, as to immediate arrest without awaiting for judicial warrant, than they possess as to other minor offences (see Arrest). Justices of the peace have under early statutes and the commission of the peace power to take sureties of the peace from persons who are threatening to commit a breach of the peace, and it is within the power of any court on conviction of any misdemeanour and of many felonies to require the offender to enter into a recognizance (q.v.) to keep the peace.

Peace Conferences, the official title of the two international conferences held at the Hague in 1899 and 1907. Both were organized at the instance of the emperor Nicholas II. of Russia. The chief object of the first conference, as set out in the note of Count Mouraviev, the Russian minister of foreign affairs at the Hague, was to arrive at an "understanding not to increase for a fixed period the present effective of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which even a reduction might be effected in future in the forces and budgets above

8 Menschliches, Allmenschliches, No. 477.

1 The Map of Life, 1902, pp. 92-97.
mentioned." The Conference, which was attended by representatives of 26 states, sat from the 18th of May to the 20th of July 1899.

When the subject of excessive armaments came up for discussion, the objections of the German military delegate led to its abandonment. Other very important matters, however, were dealt with, and three momentous conventions were adopted, viz.—

I. A convention for the pacific settlement of international disputes.

II. A convention relating to the laws and customs of war by land.

III. A convention for the adaptation to maritime warfare of the principles of the Geneva Convention of the 22nd of August 1864.

These three conventions were adopted as follows:

a. Prohibition of the employment of projectiles and explosive from balloons or by other similar methods.

b. Prohibition of the employment of projectiles which are thrown or fired from balloons.

c. Prohibition of the employment of bullets which expand or flatten easily in the human body, such as bullets with a hard envelope, of which the envelope does not entirely cover the core, or is pierced with incisions.

The following resolutions were adopted by the conference:

"The Conference, taking into consideration the preliminary steps taken by the Swiss Federal Government for the revision of the Geneva Convention, expresses the wish that steps may be taken to an assembly of a special Conference, having for its object the revision of that Convention." The Conference further expressed the following resolutions:

1. The Conference expresses the wish that the powers should regulate, by special treaties, the position, as regards military charges, of foreigners residing within their territories.

2. The Conference expresses the wish that the Governments, taking into consideration the proposals made at the Conference, may examine the possibility of an agreement as to the limitation of armed forces by land and sea, and of war budgets.

3. The Conference expresses the wish that the Governments, taking into consideration the proposals made at the Conference, may examine the possibility of an agreement as to the limitation of armed forces by land and sea, and of war budgets.

4. The Conference expresses the wish that the proposals which contemplate the declaration of the inviolability of private property in naval warfare may be referred to a subsequent conference for consideration.

"The Conference expresses the wish that the Convention to submit the question of the bombardment of ports, towns and villages by naval forces may be referred to a subsequent conference for consideration."

Great Britain signed and became a party to the three Conventions, but not to all the declarations, &c.

The Conference of 1907, which was attended by representatives of forty-four states, sat from the 15th of June to the 18th of October. Again, in spite of the resolution and request on armaments handed down from the Conference of 1899 this subject was waived, but still more important conventions than in 1899 were adopted on other matters. These were as follows:

I. Convention for the pacific settlement of international disputes.

II. Convention respecting the limitation of the employment of forces and the recovery of contract debts.

III. Convention relative to the commencement of hostilities.

IV. Conventions concerning the laws and customs of war on land.

V. Convention respecting the rights and duties of neutral powers and persons in war on land.

VI. Convention relative to the status of enemy merchant-ships at the outbreak of hostilities.

At the Conference the Russian government, further developing the proposal, submitted the following details:

1. Establishment of an international understanding for a term of five years, stipulating non-interruption of the present figures of the peace effective of the troops kept up for home use.

2. Fixation, in case of this understanding being arrived at, and, if possible, of the figures of the peace effective of all the powers excepting colonial troops.

3. Maintenance for a like term of five years of the amount of the military budgets at present in force.

This Conference was held at Geneva in June—July 1906. The revised Convention, composed of 33 articles, is dated July 6, 1906.

1 This is an amended edition of that of 1899.

2 This was practically a re-enactment of that of 1899.

3 This has since been done to a large extent by the Conference of London (1908—1909). See Blockade, Contraband, International Law Peace.
and supplied many specimens to G. Johnston, who was then preparing his *History of the British Zoophytes* (1858). It was here too that he first found fossils in some of the older rocks previously regarded as unfossiliferous—the discovery of which proved the presence of Bala Beds (Orдовикian or Lower Silurian) in the neighbourhood of Gorran Haven. In 1841 he read a paper before the British Association at Plymouth “On the Fossil Organic Remains found on the south-east coast of Cornwall,” and in 1843 he brought before the Royal Geological Society of Cornwall an account of his discovery of fish remains in the Devonian slates near Polperro. Peach was transferred for a time to Fowey; and in 1849 to Scotland, first to Peterhead and then to Wick (1853), where he made acquaintance with Robert Dick of Thurso. He collected the old Red Sandstone fishes; and during a sojourn at Durness he first found fossils in the Cambrian limestone (1854). Peach retired from the government service in 1861, and died at Edinburgh on the 28th of February 1886.

Biographical notice, with portrait, in S. Smiles’s *Robert Dick, Baker of Thurso, Geologist and Botanist* (1878).

**PEACH**

The name of a fruit tree which is included by Bentham and Hooker (Genera plantarum, 1. 610) under the genus *Prunus* (*Prunus persica*); its resemblance to the plum is indeed obvious. Others have classed it with the almond as a distinct genus, *Amygdalus*; while others again have considered it sufficiently distinct to constitute a separate genus, *Persica*.

In general terms the peach may be said to be a medium-sized tree, with lanceolate, stipulate leaves, borne on long, slender, relatively unbranched shoots, and with the flowers arranged singly, or in groups of two or more, at intervals along the shoots of the previous year’s growth. The flowers have a hollow tube at the base bearing at its free edge five sepalas, an equal number of petals, usually concave or spoon-shaped, pink or white, and a great number of stamens. The pistil consists of a single carpel with its ovary, style, stigma and solitary ovule or ovules. The fruit is a drupe (fig. 1) having a thin outer skin (epicarp) enclosing the flesh of the peach (mesocarp), the inner layers of the carpel becoming woody to form the stone, while the ovule ripens into the kernel or seed. This is exactly the structure of the plum or apricot, and differs from that of the almond, which is identical in the first instance, only in the circumstance that the fleshy part of the latter eventually becomes dry and leathery and cracks open along a line called the suture.

The nectarine is a variation from the peach, mainly characterized by the circumstance that, while the skin of the ripe fruit is downy in the peach, it is shining and destitute of hairs in the nectarine. That there is no essential difference between the two is, however, shown by the facts that the seeds of the peach will produce nectarines, and vice versa, and that it is not very uncommon, though still exceptional, to see peaches and nectarines on the same branch, and fruits which combine in themselves the characteristics of both nectarines and peaches. The blossoms of the peach are formed the autumn previous to their expansion, and this fact, together with the peculiarities of their form and position, requires to be borne in mind by the gardener in his pruning and training operations. The only point of practical interest requiring mention here is the very singular fact attested by all peach-growers, that, while certain peaches are liable to the attacks of mildew, others are not. In the case of the peach this peculiarity is in some way connected with the presence of small glandular outgrowths on the stalk, or at the base of the leaf. Some peaches have globular, others reniform glands, others none at all, and these latter trees are much more subject to mildew than are those provided with glands.

The history of the peach, almond and nectarine is interesting and important as regards the question of the origin of species and the production and perpetuation of varieties. As to the origin of the peach two views are held, that of Alphonse de Candolle, who attributes all cultivated varieties to a distinct species, probably of Chinese origin, and that adopted by many naturalists, but more especially by Darwin, who looks upon the peach as a modification of the almond.

In the first place, the peach as we now know it has been nowhere recognized in the wild state. In the few instances where it is said to have been found in the wild, the probabilities are that the tree was an escape from cultivation.

In the second place, the Hazàdárakht ravine in Afghanistan a form with different-shaped fruit from that of the almond, being larger and flatter. The surface of the fruit, he observes, "resembles that of the peach in Afghanistan, and its colour;..." The peach and the wild almond. The whole shrub resembles more what one might consider a wild form of the peach than that of the almond." It is admitted, however, by all competent botanists that the almond is the better and more probable of the two Levantine regions. Aitchison also mentions the almond as wild in some parts of Afghanistan, where it is known to the natives as "bdám," the same word that they apply to the cultivated almond. The branches of the tree are carried by the priests in religious ceremonies. It is not known as a wild plant in China or Japan. As to the nectarine, of its origin as a variation from the peach there is abundant evidence, as has already been mentioned; it is only requisite to add that the important fact that the seeds of the nectarine, even when that nectarine is the true peach, will generally produce nectarines, or, as gardeners say, "come true." Darwin brings together the records of several cases, not only of gradations between peaches and nectarines, but also of intermediary forms between the peach and the almond, which we know, however, have no case yet been recorded of a peach or a nectarine producing an almond, or vice versa, although all have had a common origin such an event might be expected. Thus the botanical evidence seems to indicate that the wild form of the peach and the cultivated almonds, peaches and nectarines, and consequently that the peach was introduced from Asia Minor or Persia, whence the name *Persica* given to the peach; and Aitchison’s discovery in Afghanistan of a form which reminded him of a wild peach lends additional force to this view.

On the other hand, Alphonse de Candolle, from philological and other considerations, considers the peach to be of Chinese origin. The peach is not, however, quite true, as it has never been cultivated there from time immemorial; it has entered into the literature and folklore of the people; and it is designated by a distinct name, "pê" or "tâo," a word found in the writings of Confucius by centuries before Christ, and even in other writings dating from the 10th century before the Christian era. Though now cultivated in India, and almost wild in some parts of the north-west, and, as we have seen, probably also in Afghanistan, it has no history there; it is not mentioned in the Hebrew text of the Scriptures, nor in the earliest Greek times. Xenophon makes no mention of the peach, though the Ten Thousand must have traversed the country where, according to some, the peach is native; but Theophrastus, a hundred years later, mentions it as a Persian fruit. Alphonse de Candolle suggests that it might have been introduced into Greece by Alexander. According to his view, the seeds of the peach, cultivated for ages in China, might have been carried by the Chinese into Kashmîr, Bokhâra, and Persia between the period of the Sârîkîs ârâmation and the Græco-Persian period. Once established, its cultivation would readily extend westward, or, on the other hand, by Cabul to north-western India, where its cultivation is not ancient. While the peach has been cultivated in China for thousands of years, the almond does not grow wild in that country and its introduction is supposed not to go back farther than the Christian era.

On the whole, greater weight is due to the evidence from botanical sources than to that derived from philology, particularly since the discovery both of the wild almond and of a form like a wild peach in Afghanistan. It may, however, well be that both peach and almond are derived from some pre-existing and now extinct form whose characteristics are preserved in parts of the area which are not otherwise occupied by the peach as mentioned; but this is a mere speculation, though indirect evidence in its support might be obtained from the nectarine, of which no mention is made in ancient literature, and which, as we have seen, originates from the peach and resembles it closely, thus offering the characteristics of a species in the act of developing itself.

The treatment in horticulture of the peach and nectarine is the same in every respect. To perpetuate and multiply the choicer varieties, peaches and nectarines are budded upon plum or almond stocks. For dry situations almond stocks are preferable, but they are not long-lived, while for damp or clayey loams it is better to use certain kinds of plums. Double-working is sometimes beneficial; thus an almond budded on a plum stock may be rebudded with a tender peach, greatly to the advantage of the latter. The peach border should be composed of turf or mellow
loam, such as is suitable for the vine and the fig; this should be used as in a rough state as possible, or not broken small and fine. The stakes should slope towards the edge of where a drain should be cut, with an outlet, and on this sloping bottom should be laid a thickness of from 9 in. to 12 in. of rough materials, such as broken bricks or mortar rubbish, over which should be placed a layer of rough turf with the grassy side downwards, and then the good loamy soil to form the border, which should have a depth of about 2 ft. 6 in. The peach-tree is most productive when the roots are kept near the surface, and the borders, which should be from 8 ft. to 12 ft. wide, should not be cropped heavily with culinary vegetables, as deep trenching is very injurious. Sickly and unfruitful trees may often be revived by bringing up their roots within 5 or 6 in. of the surface. It is questionable whether it is not better, in cold soils and bleak situations, to abandon outdoor peach culture, and to cover the walls with a casing of glass, so that the trees may be under shelter during the ungenial spring weather.

The fruit of the peach is produced on the ripened shoots of the preceding year. In one tree, however, the shoots deal with fruits; and, if these are not bearing fruit, but they yield nothing but leaves; and if too weak, they are incapable of developing flower buds. To furnish young shoots in sufficient abundance, and of requisite strength, is the great object of peach training and pruning. Trees of slender growing, twiggy habit, are not the most readily adaptable into the fan form of training, and accordingly this has generally been adopted in the culture of peaches and nectarines (fig. 1). The young tree, in many cases, procured when it has been trained for two or three years in the nursery; but it is generally better to begin with a maiden plant—that is, a plant of the first year after it has been budded. It is then headed down to five or six buds, and in the following summer from two to four shoots, according to the vigour of the plant, are trained in, the laterals from which, if any, are thinned out and nailed to the wall. If there are four branches, the two central ones are shortened back at the subsequent winter pruning so as to produce others, the two lower ones being laid in nearly at full length. In the following season adding little or no growth, a willow, and, if the process of eight or ten principal limbs or mother branches are obtained, forming, as it were, the frame-work of the future tree. The branches may be depressed or elevated, so as to check or encourage them, as occasion may require; but it is highly advisable to keep them from their becoming in any part deficient of young shoots. Sometimes a more rapid mode of formation is now adopted, the main shoots being from the first laid in nearly at full length, instead of being shortened. The pruning for fruit consists in shortening the laterals which had been nailed in at the disbudding, or summer pruning, their length depending on their individual vigour and the luxuriance of the tree. In well-developed shoots the buds are generally double, or rather triple, a wood bud growing between two fruits, or else a wood bud alone, so that a young shoot may be produced to draw up the sap beyond the fruit, this being generally desirable to secure its proper swelling. The point of this leading shoot is subsequently pinched off, that it may not drop away too much of the sap. If the fruit sets too abundantly, it must be thinned, first when as large as peas, reducing the clusters, and then when as large as nuts to distribute the crop equally; the extreme thinning must be done before the fruit is large enough to be eaten; but one or two fruits ultimately left to each square foot of wall is a full average crop. The final thinning should take place after stoning.

In the best-placed healthy young shoot produced from the wood buds at the base of the bearing branch is to be carefully preserved and in due time nailed to the wall. In the following winter this will take the place of the branch which has just borne, and which is to be cut out. If no young shoot growing from another branch is short, the shoot at the point of the latter may sometimes be preserved as a fruit bearer, though if the bearing branch be long it is better to cut it back for young wood. It is the neglect of this which constitutes the principal fault in carrying out the English fan system as it is usually practised. Several of the branches of the trees ought to be regularly examined, and the young shoots respectively topped or thinned out; those that remain are to be nailed to the wall, or braced in with pieces of slender twigs, and the trees ought soon to be washed with the garden engine or thoroughly syringed, especially during very hot summers. After gathering the all wood not needed for extending the tree or for fruit bearing next season should be cut out so as to give the shoots left full exposure to air and light.

The Montreuil form of training is represented by fig. 2. The principal feature is the suppression of the direct channel of the sap, and the substitution of four, or more commonly two, mother branches, so laid to the wall that the central angle contains about 90°. The other branches are all treated as subordinate members. This form is open to the objection that, if the under branch should die, the upper one can be brought down into its place.

The form à la Dumoutier (fig. 3), so called from its inventor, is merely a refinement on the Montreuil method. The formation

![Fig. 2.—Montreuil Fan Training.](image)

of the tree begins with the inferior limbs and proceeds towards the centre, the branches being lowered from time to time as the tree acquires strength. What is most worthy of notice in this method is the arrangement of the branches and radii in the pruning for fruit. When a shoot promises blossom, it is generally at some distance from the point of union of the old wood, and the intermediate space is covered with wood buds. All the latter, therefore, which are between the old wood and the shoots, are carefully removed by rubbing them off with the finger. This never fails to produce a shoot d, the growth naturally being favoured by destroying the useless sap e above the blossoms, and pinching off the points of those which are necessary to perfect the fruit. A replacing shoot is thus obtained, to which the whole is invariably shortened at the end of the year.

Seymour's form (fig. 5) approaches more nearly to the French method than any other practised in England; but the direct channel

![Fig. 3.—Dumoutier's Fan Training.](image)

of the sap is not suppressed, and this results in the production of branches of unequal vigour, which is very undesirable.

For cold and late situations, Thomas Andrew Knight recommended the encouragement of spurs on the young wood, as such spurs, when close to the wall, generate the best organized and most vigorous blossoms, and generally ensure a crop of fruit. They may be produced, by taking care, during the summer pruning or disbudding, to preserve a number of the little shoots emitted by the yearly shoots thus formed blossom buds will be developed early in the following season. This practice is well adapted to cold situations. Peach-trees require protection, especially at the period of blossoming. Screen and bunting screens are most effectual. By applying these early in the season, great benefit may be derived from retarding the blossom till the frosty nights of spring have passed. Wooden and glass screens are also very useful in warding off frost. Care must be taken that the roots always have a sufficient supply of moisture and that the soil is moist wherever the roots run.

**Forcing.—** The pruning and training of the trees in the peach house do not differ materially from the methods practised out of doors. It may also be stated here that when occasion arises peach-trees well furnished with buds may be transplanted and forced immediately without risking the crop of fruit, a matter of some importance when, as sometimes happens, a tree may accidentally fail. In the forcing of peaches fire heat is commonly applied about December or January; but it may, where there is a demand, begin a month sooner. The trees must be got to start growth very
gradually, and at first the house should be merely kept closed at a temperature of about 45°, but the heat should gradually increase to 50° at night by the time the trees are in flower, and to 60° when the fruit is set, after which the house should be kept moist by sprinkling the walls and paths, or by placing water trugs on the return pieces. The temperature should then be raised to 65° by day to 70° or more with sun heat. After the fruit has set, the foliage should be refreshed and cleansed by the daily use of the syringe or garden engine. When the fruit has stoned—that is, as soon as the kernels have been formed—the temperature should be raised to about 68° as a minimum, and to 70°, with 75°, with sun heat, as a maximum. Water must now be copiously supplied to the border, and air admitted in abundance, but cold draughts which favour the attack of mildew must be avoided. After the end of April little heat is required. When the fruit begins to ripen, syringing must be discontinued till the crop is gathered, after which the syringe must be again occasionally used. If the leaves should happen to shade the fruit, not only during the ripening season, but even for some time after the storm period, they should be gently turned aside, for, in order that the fruit may acquire good colour and flavour, it should be freely exposed to light and air when ripening; it will bear the direct rays of the sun, even if they should rise to 100°, but nectarines are much more liable to damage than peaches. The trees often suffer from mildew, which is best prevented by keeping the borders of the peach house clear and sufficiently moist and the house well ventilated, and if it should appear the trees should be sprayed with 1 oz. potassium sulphide dissolved in 3 gallons of water. Cere must be taken in using this fungicide not to wet the painted wood, as it is sure to become discoloured.

Peaches and nectarines are frequently cultivated in well-drained pots and are generally trained as pyramids, and in some cases as half-storans. The potting must be done very firmly, using turfy loam with which a little mortar rubble has been mixed. The trees are to be top-dressed from time to time with well-decayed manure and turfy loam, and considerable space must be left in the pots for this and the watering.

The following are some of the best peaches and nectarines, arranged in the order of the times of their ripening:

**Peaches.**

| Early Beatrice | m. July | Royal George | b. Aug. |
| River's Early York | b.m. Aug. | Dymond | m. Sept. |
| A'bec | e. Aug. | Late Admirable | m.e. Sept. |

**Nectarines.**

| Cardinal (under glass) | e. July | Pitmatson Orange | c. Aug. |
| Elrige | b. Sept. | Stanwick (under glass) | m.e. Sept. |

**PEACHAM, HENRY** (c. 1576-1643), English writer, was the son of Henry Peacham, curate of North Mims, Hertfordshire, and author of a book on rhetoric called *The Garden of Rhetoric* (1577). The elder Peacham became in 1597 rector of Leveton, Lincolnshire. The son was educated at Trinity College, Cambridge, where he graduated B.A. in 1594-1595 and M.A. in 1598. He was for some time a schoolmaster at Wymondham, Norfolk, but settled in London in 1612, earning himself living as tutor to young men preparing for the universities. His first book was *Graphice* (1616), a treatise on pen and water-colour drawing, which, as *The Gentleman's Exercise*, passed through three editions. The years 1613-1614 he spent abroad, part of the time as tutor to the three young sons of Thomas Howard (1583-1640), earl of Arundel, and partly on his own account. He travelled in Italy, France, Westphalia and the Netherlands.

The table of Sir John Ogle, English governor of Utrecht, was, he says, "a little academy," where he met soldiers and scholars of all nationalities. When he returned to London he was accused of libel on the king. Incriminating papers had been discovered in the house of Edmond Peacham, rector of Hinton Saint George, who, on being charged with an attack on the king denied the authorship, stating that they were written by a nameake, "a divine, a scholar and a traveller." The change was, however, not rebutted. Peacham had many friends in London, among them Thomas Dowland the musician, Inigo Jones, and Edward Wright the mathematician. In 1622 appeared Peacham's *magus opus*, the *Compleat Gentleman*. Enlarged editions appeared in 1626 and 1627. The 1627 edition was reprinted in 1634, and a third, with additional notes on blazonry by Thomas Blount (1617-1679), appeared in 1661. The book is a text-book of manners and polite learning; it includes chapters on cosmography, geometry, poetry, music, antiquities, painting, the lives of the painters, the "art of limming" (Peacham himself was a proficient engraver), and the military art, including the order of "a maine battalle or pitched field in eight severall wayes." The book differs from the *Courtier* of Castiglione, which had been the guide of an earlier generation. Peacham was a Cavalier, even an ardent polemist in the royal cause, but the central point of his book is a more or less Puritan sentiment of duty. In his later years Peacham was reduced to extreme poverty, and is said to have written children's books at a penny each. His last book was published in 1642, and it may be concluded that he died soon after his arrival in London.

His other works include: *Minerva Britanni* (1612), dedicated to Henry, prince of Wales; *The Period of Mourning* (1613), in honour of the same prince; *Thalia's Bengal* (1620), a book of epigrams; *The Art of Living in London* (1642), and *The Worth of a Penny* (1641). The most complete collection of Peacham's work is that published in the Bodleian, Oxford. Harleian MS. 685 contains a translation of Peacham's I. *'S Basilicon Doren* into Latin verse, written in his own hand and ornamented with pen and ink drawings. His *Compleat Gentleman* was edited by G. S. Gordon in 1806 for the Clarendon Press; the *Art of Living* is reprinted in the Harleian Misc. ix.; *The Worth of a Penny* in E. Arber's *English Garner* (vol. vi. 1883).

**PEACOCK, SIR BARNES** (1810-1890), English judge, was born in 1810, the son of Lewis Peacock, a solicitor. After practising as a special pleader, he was called to the bar in 1836, and in 1844 obtained great reputation by pointing out the flaw which invalidated the conviction of Daniel O'Connell and his fellow defendants. In 1852 he went to India as legal member of the governor-general's council. He here displayed great activity as a law reformer, but sometimes manifested too little consideration for the sentiments of the people. He published several complete collections of *Peacham's* works, and was presented with the book and ink drawings. His *Compleat Gentleman* was edited by G. S. Gordon in 1806 for the Clarendon Press; the *Art of Living* is reprinted in the Harleian Misc. ix.; *The Worth of a Penny* in E. Arber's *English Garner* (vol. vi. 1883).

**PEACOCK, GEORGE** (1791-1858), English mathematician, was born at Thornton Hall, Denton, near Darlington, on the 8th of April 1791. He was educated at Richmond, Yorkshire, and entered Trinity College, Cambridge, in 1809. He was second wrangler in 1812 (Sir J. F. W. Herschel being senior), was elected fellow of his college in 1814, became assistant tutor in 1815 and full tutor in 1823. While still an undergraduate he formed a league with John Herschel and Charles Babbage, to conduct the famous struggle of "d'ism versus dot-age," which ended in the introduction into Cambridge of the continental notation in the infinitesimal calculus to the exclusion of the fluxional notation of Sir Isaac Newton. This was an important reform, not so much on account of the mere change of notation (for mathematicians follow J. L. Lagrange in using both these notations), but because it signified the opening to the mathematicians of Cambridge of the vast storehouse of continental discoveries. The analytical society thus formed in 1813 published various memoirs, and translated S. F. Lacroix's *Differential Calculus* in 1816. Peacock powerfully aided the movement by publishing in 1820 *A Collection of Examples of the Application of the Differential and Integral Calculus*. In 1841 he published a pamphlet on the
PEACOCK, T. L.

Buckingham and the Liverpool salt interest, and made the subject of steam navigation to India peculiarly his own. He represented the company before the various parliamentary committees on this question; and in 1839 and 1840 superintended the construction of iron steamers, which not only made the voyage round the Cape successfully, but proved very useful in the Chinese War. He also drew up the instructions for the Euphrates expedition of 1835, subsequently pronounced by its commander, General F. R. Chesney, to be models of sagacity. In 1836 he succeeded James Mill as chief examiner, and in 1856 he retired upon a pension. During his later years he contributed several papers to Fraser's Magazine, including reminiscences of Shelley, whose executor he was. He also wrote in the same magazine his last novel, Gryll Grange (1856), inferior to his earlier writings in humour and vigour, but still a surprising effort for a man of his age. He died on the 23rd of January 1866 at Lower Halliford, near Chertsey, where, so far as his London occupations would allow him, he had resided for more than forty years.

Peacock's position in English literature is unique. There was nothing like his type of novel before his time; though there might have been if it had occurred to Swift to invent a story as a vehicle for the dialogue of his Polite Conversation. Peacock speaks as well in his own person as through his puppets; and his pithy wit and sense, combined with remarkable grace and accuracy of natural description, stone for the primitive simplicity of plot and character. Of his seven fictions, Nightmare Abbey and Crochet Castle are perhaps on the whole the best, the former displaying the most vis comica of situation, the latter the fullest maturity of intellectual power and the most skillful grouping of the motley crowd of "perfectibilians, deteriorationists, statu-quo-ites, phrenologists, transcendentalists, political economists, theorists in all sciences, projectors in all arts, morbid visionaries, romantic enthusiasts, lovers of music, lovers of the pictures and lovers of good dinners," who constitute the dramatis personae of the Peacockian novel. Maid Marion and The Misfortunes of Elphin are hardly less entertaining. Both contain descriptive passages of extraordinary beauty. Melincourt is a comparative failure, the excellent idea of an orang-outang mimicking humanity being insufficient as the sole groundwork of a novel. Headlong Hall, though more than foreshadowing the author's subsequent excellence, is marred by a certain boohusk awkwardness characteristic of the recluse student, which reappears in Gryll Grange as the pedantry of an old-fashioned scholar, whose likes and dislikes have become inveterate and whose sceptical liberalism, always rather inspired by hatred of cant than enthusiasm for progress, has petrified into only too earnest conservatism. The book's quaint resolve paganism, however, is very refreshing in an age eaten up with introspection; it is the kindliest of Peacock's writings, and contains the most beautiful of his poems, "Years Ago," the reminiscence of an early attachment. In general the ballads and songs interspersed through his tales are models of exact and melodious diction, and instinct with true feeling. His more ambitious poems are worth little, except Rhododaphne, attractive as a story and perfect as a composition, but destitute of genuine poetical inspiration. His critical and miscellaneous writings are always interesting, especially the pleasing and lost classical plays in the Horse dramatica, but the only one of great mark is the witty and crushing exposure in the Westminster Review of Thomas Moore's ignorance of the manners and belief he has ventured to portray in his Epicurean. Peacock resented the misrepresentation of his favourite sect, the good and ill of whose tenets were fairly represented in his own person. Some-what sluggish and self-indulgent, incapable of enthusiasm or self-sacrifice, he yet possessed a deep undemonstrative kindliness of nature; he could not bear to see anyone near him unhappy or uncomfortable; and his sympathy, no less than his genial humour, gained him the attachment of children, dependants, and friends. In official life he was upright and conscientious; his judgment was shrewd and robust. What Shelley justly termed "the lightness, strength and chastity" of his diction secures him an honourable rank among those English writers whose claims to remembrance depend not only upon matter but upon style.
Peacock's works were collected, though not completely, and published in three volumes in 1875, at the expense of his friend and former protegé, Sir Henry Cole, with an excellent memoir by his granddaughter Mrs Clarke, and a critical essay by Lord Houghton. His prose works were collected by Richard Garnett in ten volumes (1891). Separate novels are included in "Macmillan's Illustrated Standard Novels," with introductions by Mr Saintsbury. For an interesting personal notice, see A Poet's Sketch Book, by R. W. Buchanan (1884).

PEACOCK (Lat. Pavo, O. Eng. Pawe, Du. pauw, Ger. Pfau, Fr. Paon), the bird so well known from the splendid plumage of the male, and as the proverbial personification of Pride. It is a native of the Indian peninsula and Ceylon, in some parts of which it is very abundant. Setting aside its importation to Palestine by Solomon (1 Kings x. 22; 2 Chron. ix. 21), its assignment in classical mythology as the favourite bird of Hera testifies to the early acquaintance the Greeks must have had with it; but, though it is mentioned by Aristophanes and other older writers, their knowledge of it was probably very slight until after the conquests of Alexander. Throughout all succeeding time, however, it has never very freely rendered itself to domestication, and, though in earlier days highly esteemed for the table, it is no longer considered the delicacy it was once thought; the young of the wild birds are, however, still esteemed in the East.

As in most cases of domestic animals, pied or white varieties of the ordinary peacock, Pavo cristatus, are not infrequently to be seen, and they are valued as curiosities. Greater interest, however, attends what is known as the Japanese or Japan peacock, a form which has received the name of P. nipponicus, as though it were collected by Richard Garnett in ten volumes, besides other less conspicuous differences, has all the upper-wing-coverts of a deep lustrous blue instead of being mottled with brown and white, while the hen is of a more or less grizzled-white. It "breeds true"; but occasionally a presumably pure stock of birds of the usual coloration throws out one or more having the Japan plumage. It is to be observed that the male has in the coloration of the parts mentioned no little resemblance to that of the second indubitably good species, the P. muticus (or Spicifer of some writers) of Burma and Java, though the character of the latter's crest—the feathers of which are barbed along their whole length instead of at the tip only—and its golden-green neck and breast furnish a ready means of distinction. Sir R. Heron was confident that the Japan breed had arisen in England within his memory; and C. Darwin (Animals and Plants under Domestication, i. 290–292) was inclined to believe it only a variety; but its abrupt appearance, which rests on indubitable evidence, is most suggestive in the light that it may one day throw on the question of evolution as exhibited in the origin of "species." It should be stated that the Japan bird is not known to exist anywhere as a wild race, though apparently kept in Japan. The accompanying illustration is copied from a plate drawn by J. Wolf, given in D. G. Elliot's Monograph of the Phasianidae.

The peafows belong to the group Gallinae, from the normal members of which they do not materially differ in structure; and, though by some systematists they are raised to the rank of a family, Phasianidae, most are content to regard them as a sub-family of Phasianidae (Pheasant, &c.). Akin to the genus Pavo is Polyplectron, of which the males are armed with two or more spurs on each leg, and near them is generally placed the genus Argusianus, containing the argus-pheasants, remarkable for their wonderfully ocellated plumage, and the extraordinary length of the secondary quills of their wings, as well as of the tail-feathers. It must always be remembered that the so-called "tail" of the peacock is formed not as a part of the crested tail-feathers, but by the singular development of the tail-coverts.

PEAK, THE, a high table-land in the north of Derbyshire, England, included in the Pennine range of hills. The name, however, is extended, without definite limits, to cover the whole of the hilly district north of Buxton. The table-land reaches an elevation of 2088 ft. in Kinder Scout. The geological formation is millstone-grit, and the underlying beds are not domed, but cup-shaped, dipping inward from the flanks of the mass. The summit is a peaty moorland, through which masses of rock project at intervals. The name of this high plateau has from the 17th century been identified with "peak," the pointed or conical top of a mountain, but the very early references to the district and certain places in it show clearly, as the New English Dictionary points out, that this connexion is unwarranted. The name appears in the Old English Chronicle (924) as Peakland, of the district governed from the castle of Peveril of the Peak (see Derbyshire), and also in the name of the cavern under the hill at Castleton, Peak's Arise. Peak, it has been suggested, is the name of a local deity or demon, and possibly more correctly identified with Puck. For the etymology of "peak," point, &c., and its variants or related words, "pick" and "pike," see Pike.

PEALE, CHARLES WILLSON (1741–1826), American portrait painter, celebrated especially for his portraits of Washington, was born in Queen Anne county, Maryland, on the 16th of April 1741. During his infancy the family removed to Chestertown, Kent county, Maryland, and after the death of his father (a country schoolmaster) in 1750 they removed to Annapolis. Here, at the age of 13, he was apprenticed to a saddler. About 1764 he began seriously to study art. He got some assistance from Gustavus Hesselius, a Swedish portrait painter then living near Annapolis, and from John Singleton Copley in Boston; and in 1767–1770 he studied under Benjamin West in London. In 1770 he opened a studio in Philadelphia, and met with immediate success. In 1772, at Mount Vernon, Peale painted a three-quarters-length study of Washington (the earliest known portrait of him), in the uniform of a colonel of Virginia militia. This canvas is now in the Lee Memorial Chapel of Washington and Lee University. He painted various other portraits of Washington; probably the best known in a full-length, which was made in 1778, and of which Peale made many copies. This portrait had been ordered by the Continental Congress, which, however, made no appropriation for it, and eventually it was bought for a private collection in Philadelphia. Peale painted two miniatures of Mrs Washington (1772 and 1777), and portraits of many of the famous men of the time, a number of which are in Independence Hall, Philadelphia. His portraits of Washington do not appeal so strongly to Americans as do those of Gilbert Stuart, but his admitted skill as a draughtsman gives to all of his work considerable historical value. Peale removed to

1 Classical authors contain many allusions to its high appreciation at the most sumptuous banquets; and medieval bills of fare on state occasions nearly always include it. In the days of chivalry one of the most solemn oaths was taken "on the peacock," which seems to have been served up garnished with his gaudy plumage.

2 A. Newton himself regarded this as probably incorrect.
PEALE, R.—PEAR

Philadelphia in 1777, and served as a member of the committee of public safety; he aided in raising a militia company, became a lieutenant and afterwards a captain, and took part in the battles of Trenton, Princeton and Germantown. In 1779-1780 he was a member of the Pennsylvania assembly, where he voted for the abolition of slavery—he freed his own slaves whom he had brought from Maryland. In 1801 he undertook, largely at his own expense, the excavation of the skeletons of two mastodons in Ulster and Orange counties, New York, and in 1802 he established at Philadelphia Peale's Museum. He was one of the founders, in 1805, of the Pennsylvania Academy of the Fine Arts at Philadelphia. At the age of eighty-one Peale painted a large canvas, "Christ Healing the Sick at Bethesda," and at eighty-three a full-length portrait of himself, now in the Academy of the Fine Arts. He died at his country home, near Germantown, Pennsylvania, on the 22nd of February 1826.

His brother, JAMES PEALE (1749-1831), also an artist, painted two portraits of Washington (one now the property of the New York Historical Society, and the other in Independence Hall, Philadelphia), besides landscapes and historical compositions. Born at Philadelphia, 1775-1786, American and English, was born in Bucks county, Pennsylvania, on the 2d of February, 1778, the son of Charles Willson Peale (p.r.). He studied under his father, under Benjamin West in London (1802-1803), and in Paris in 1807 and 1809. As early as 1795 he had begun life a portrait of Washington. Of this he made many replicas, the latest in 1823, purchased by the United States government in 1832, and now in the Capitol of Washington. Peale was one of the first of American lithographers. He was an excellent draughtsman, but in colour his work cannot rank with his father's. In 1843 he devised for the Philadelphia public schools a system of teaching drawing and penmanship. His portraits include those of President Jefferson, Mrs Madison, Commodores Perry, Decatur, and Bainbridge, Houdon, the sculptor, General Armstrong, and an equestrian portrait of General Washington, now in Independence Hall, Philadelphia. His "Court of Death" (1820) is in the Detroit Art Gallery. In 1825 Peale succeeded John Trumbull as president of the American Academy of Fine Arts (founded in 1803 as the New York Academy of Fine Arts), and he was one of the original members of the National Academy of Design. He wrote several books, among them Notes on Italy (1831), Reminiscences of Art and Artists (1845). He died in Philadelphia on the 3d of October 1860.

A brother, RAPHAELLE PEALE (1774-1825), was one of the earliest of American still-life painters; and another brother, TITIAN RAMSEY PEALE (1800-1885), made numerous drawings, some of them in water-colour, in illustration of animal life.

PEAR (Pyrus communis), a member of the natural order Rosaceae, belonging to the same genus as the apple (P. malus), which it resembles in floral structure. In both cases the so-called fruit is composed of the receptacle or upper end of the flower-stalk (the so-called calyx tube) greatly dilated, and enclosing within its cellular flesh the five carpellary carpels which constitute the "core" and are really the true fruit. From the upper rim of the receptacle are given off the five sepalis, the five petals, and the very numerous stamens. The form of the pear and of the apple respectively, although usually characteristic enough, is not by itself sufficient to distinguish them, for there are pears which cannot by form alone be distinguished from apples, and apples which cannot by superficial appearance be recognized from pears. The main distinction is the occurrence in the tissue of the fruit, or beneath the rind, of clusters of cells filled with hard woody deposit in the case of the pear, constituting the "girt," while in the apple no such formation of woody cells takes place. The appearance of the tree—the bark, the foliage, the flowers—is, however, usually quite characteristic in the two species. Cultivated pears, whose number is enormous, are without doubt derived from one or two wild species widely distributed throughout Europe and western Asia, and sometimes forming part of the natural vegetation of the forests. In England, where the pear is sometimes considered wild, there is always the doubt that it may not really be so, but the produce of some seed of a cultivated tree deposited by birds or otherwise, which has degenerated into the wild spine-bearing tree known as Pyrus communis.

The cultivation of the pear extends to the remotest antiquity. Traces of it have been found in the Swiss lake-dwellings; it is mentioned in the oldest Greek writings, and was cultivated by the Romans. The word "pear" or its equivalent occurs in all the Celtic languages, while in Slavonic and other dialects different appellations, but still referring to the same thing, are found—a diversity and multiplicity of nomenclature which led Alphonse de Candolle to infer a very ancient cultivation of the tree from the shores of the Caspian to those of the Atlantic. A certain race of pears, with white down on the under surface of their leaves, is supposed to have originated from P. nivalis, and their fruit is chiefly used in France in the manufacture of Perry (see CIDER). Other small-fruited pears, distinguished by their precocity and apple-like fruit, may be referred to P. cordata, a species found wild in western France, and in Devonshire and Cornwall.

Karl Koch considered that cultivated pears were the descendants of three species—P. persica (from which the bergamots have descended), P. elaeagnifolia and P. sinensis. J. Decaisne, who made the subject the object of critical study, for a number of years, and now confined the study to the Indian pears and the species of China, has established the constancy of the pears, and the peculiarities of the numerous varieties cultivated in the Jardin des Plantes at Paris, refers all cultivated pears to one species, the individuals of which have in course of time diverged in various directions, so as to form five or six races: (1) The Cultives, including P. cordata, P. giganter, P. Germanica, including P. communis, P. achatra, and P. piraster; (2) the Hellenic, including P. parviflora, P. sinica and others; (4) the Pontic, including P. elaeagnifolia; (5) the Indian, comprising P. communis; and (6) the Mongole, represented by P. sinensis. With reference to the Celtic race, P. cordata, it is interesting to note its connexion with Arthurian legend and the Isle of Avalon or Isle of Apples. An island in Loch Awe has a Celtic legend containing the following words: "On an island in Loch Awe there is a certain pear tree, of such a nature that this case the word is "berries" instead of "apples."" Dr. Phéné visited Armoric (Brittany) with a view of investigating these matters, and brought thence fruits of a small berry-like pear, which were identified with the Pyrus cordata of western France.

Cultivation. The pear may be readily raised by sowing the pips of ordinary cultivated or of wild kinds, these forming what are known as free or pear stocks, on which the chiefer varieties are grafted for future. For new varieties the flowers should be fertilized with a view to combine, in the seedlings which result from the union, the desirable qualities of the parents. The dwarf and pyramid trees, more usually planted in gardens, are obtained by grafting on the quince stock, the Portuguese quince being the best; but this stock, from its surface-rooting habit, is most suitable for soils of a cold damp nature. The pear-stock, having an inclination to send its roots down deeper into the soil, is the best for light dry soils, as the plants are not then so likely to suffer in dry seasons. Some of the finer pears do not unite readily with the quince, and in this case double working is resorted to; that is to say, a vigorous-growing pear is first grafted on the quince, and then the choicer pear is grafted on the pear introduced as its foster parent.

In selecting young pear trees for walls or espaliers, some persons prefer plants one year old from the graft, but trees two or three years trained are usually preferred. The trees should be planted immediately before or after the fall of the leaf. The wall trees require to be planted from 25 to 30 ft. apart when on free stocks, and from 15 to 20 ft. when dwarfed. Where the trees are trained as pyramids or columns they may stand 8 or 10 ft. apart, but standards in orchards should be allowed at least 30 ft., and dwarf bush trees half that distance.

In the formation of the trees the same plan may be adopted as in the case of the apple. For the pear orchard a warm situation is very desirable, with a soil deep, substantial, and thoroughly drained. Any good free loam is suitable, but a calcareous loam is the best. Pear trees worked on the quince should have the stock covered up to its junction with the graft. This is effected by raising up a small mound of rich compost around it, a contrivance which induces the graft to emit roots into the surface soil.
and also keeps the stock from becoming hard or bark-bound. The fruit of the pear is produced on spurs, which appear on shoots more than one year old. The mode most commonly adopted of training wall pear-trees is the horizontal. For the slender twiggy sorts the fan form is to be preferred, while for strong growers the half-fan or the horizontal is more suitable. In the latter form old trees, the summer pruning of which has been neglected, are apt to acquire an undue projection from the wall and become scraggy, to avoid which a portion of the old spurs should be cut out annually.

The summer pruning of established wall or espalier-rail trees consists chiefly in the timely displacing, shortening back, or rubbing off of the superfluous shoots, so that the winter pruning, in horizontal training, is little more than adjusting the leading shoots and thinning out the spurs, which should be kept close to the wall and allowed to retain but two or at most three buds. In fan-training the subordinate branches must be regulated, the spurs thinned out, and the young laterals finally established in their places. When horizontal trees have fallen into disorder, the branches may be cut back to within 6 in. of the vertical stem and branch, and trained in afresh, or they may be grafted with other sorts, if a variety of kinds is desired.

Summer and autumn pears should be gathered before they are fully ripe, otherwise they will not in general keep more than a few days. The Jargonelle should be allowed to remain on the tree and be pulled daily as wanted, the fruit from standard trees thus succeeding the production of the wall trees. In the case of the Crassane the crop should be gathered at three different times, the first a fortnight or more before it is ripe, the second a week or ten days after that, and the third when fully ripe. The first gathering will come into eating latest, and thus the season of the fruit may be considerably prolonged. It is evident that the same method may be followed with other sorts which continue only a short time in a mature state.

Diseases.—The pear is subject to several diseases caused by fungi. Gymnosporangium sabinae, one of the rusts (Uredinaeae) passes one stage of its life-history on living pear leaves, forming large, red in spots or patches which are at first yellow but soon become red and are visible on both faces; on the lower face of each patch is a group of cluster-cups or acidia containing spores which escape when ripe. This stage in the life-history was formerly regarded as a distinct fungus with the name Roestella cajenderana; it is now, however, evident that the spores germinate on young juniper leaves, in which they give rise to this other stage in the plant's history known as Gymnosporangium. The gelatinous, generally reddish-brown masses of spores—known as the teliospores—formed on the spurs and young twigs and form minute spores—sporidia—which give rise to the acedium stage on the pear. Diseased pear leaves should be picked off and destroyed before the spores are scattered and the various species of juniper on which the alternate stage is developed should not be allowed near the pear trees.

Pear scab is caused by a parasitic fungus, Fusicladium pyrinum, a very closely allied and perhaps merely a form of the apple scab fungus, F. dematioides. In the case of the apple disease it forms large irregular blackish blotches on the fruit and leaves, the injury being often very severe especially in a cool, damp season. The fungus mycelium grows between the cuticle and the epidermis, the former being ruptured by numerous short branches bearing spores (conidia) by means of which the disease is spread. An active, ventive repeated spraying with dilute Bordeaux mixture is recommended, during the flowering season and early development of the fruit. Similar spraying is recommended for pear-leaf blight caused by Taphrina pruni, which forms swollen areas on the leaves. Pear trees may also be attacked by a great variety of insect pests. Thus the younger branches are often may be removed by washing in winter with soft soap and hot water. A number of larvae of Lepidoptera feed on the leaves—the remedy is to capture the mature insects when possible. The winter moth (Chimatoloba brunata) must be kept in check by putting greasy bands round the trunks from October till December or January, to catch the wingless females that crawl up and deposit their eggs in the cracks and crevices in the bark. The caterpillars of the leopard moth (Zena z pyrina) and of the goat moth (Cosmus ignitor) sometimes bore their way into the trunks and destroy the sap channels. If badly bored, the trees are useless; but in

which bear excrescences, or are honeycombed by boring parasites, are those most likely to yield pearls.

The substance of a pearl is essentially the same as that which lines the interior of many shells and is known as "mother-of-
pearl." Sir D. Brewster first showed that the iridescence of this substance was an optical phenomenon due to the interference of rays of light reflected from microscopic corrugations of the surface—an effect which may be imitated by artificial striations on a suitable medium. When the inner laminated portion of a nacreous shell is digested in acid the calcareous layers are dissolved away, leaving a very delicate membranous pellicle, which, as shown by Dr Carpenter, may retain the iridescence as long as it is undisturbed, but which loses it when pressed or stretched.

It is obvious that if a pearl presents a perfectly spherical form it must have remained loose in the substance of the muscles or other soft tissues of the mollusc. Frequently, however, the pearl becomes cemented to the interior of the shell, the point of attachment thus interfering with its symmetry. In this position it may receive successive nacreous deposits, which ultimately form a pearl of hemispherical shape, so that when cut from the shell it may be flat on one side and convex on the other, forming what jewelers know as a "perle bouton." In the course of growth the pearl may become involved in the general deposit of mother-of-pearl, and be ultimately buried in the substance of the shell. It has thus happened that fine pearls have occasionally been unexpectedly brought to light in cutting up mother-of-pearl in the workshop.

When a pearl oyster is attacked by a boring parasite the mollusc protects itself by depositing nacreous matter at the point of invasion, thus forming a hollow body of irregular shape known as a "blist pearl." Hollow warty pearl is sometimes termed in trade "coq de perle." Solid pearls of irregular form are often produced by depositon on rough objects, such as small fragments of wood, and these, and in fact all irregular-shaped pearls, are termed "perles baroques," or "barro pearls." It appears that the Romans in the period of the Decline restricted the name unio to the globular pearl, and termed the baroque mairgurium. It was fashionable in the 16th and 17th centuries to mount curiously shaped baroques in gold and enamel so as to form ornamental objects of grotesque character. A valuable collection of such mounted pearls by Dinglinger is preserved in the Green vaults at Dresden.

A pearl of the first water should possess, in jewelers' language, a perfect "skin" and a fine "orient"; that is to say, it must be of delicate texture, free from speck or flaw, and of clear almost translucent white colour, with a subdued iridescent sheen. It should also be perfectly spherical, or, if not, of a symmetrical pear-shape. On removing the outer layer of a pearl the subjacent surface is generally dull, like a dead fish-eye, but it occasionally happens that a poor pearl encloses a "lively kernel," and may therefore be improved by careful peeling. The most perfect pearl in existence is said to be one, known as "La Pellegrina," in the museum of Zosima in Moscow; it is a perfectly globular Indian pearl of singular beauty, weighing 28 carats. The largest known pearl is one of irregular shape in the Beresford Hope collection at the Victoria and Albert Museum. This magnificent pearl weighs 3 oz., has a circumference of 44 in., and is surmounted by an enamelled and jewelled gold crown, forming a pendant of great value.

Pearl Fisheries.—The ancients obtained their pearls chiefly from India and the Persian Gulf, but at the present time they are also procured from the Sulu seas, the coast of Australia, the shores of Central America and some of the South Pacific Islands. The ancient fisheries of Ceylon (Taprobane) are situated in the Gulf of Mannar, the fishing-banks lying from 6 to 8 m., off the western shore, a little to the south of the isle of Mannar. The Tinnevelly fishery is on the Madras side of the strait, near Tuticorin. These Indian fishing-grounds are under the control of government inspectors, who regulate the fisheries. The oysters yield the best pearls at about four years of age. Fishing generally commences in the second week in March, and lasts for from four to six weeks, according to the season. The boats are grouped in fleets of from sixty to seventy, and start usually at midnight so as to reach the oyster-banks at sunrise. Each boat generally carries ten divers. On reaching the bank a signal-gun is fired, and diving commences. A stone weighing about 40 lb. is attached to the cord by which the diver is let down. The divers work in pairs, one man diving while the other watches the signal-cord, drawing up the sink-stone first, then hauling up the baskets of oysters, and finally raising the diver himself. On an average the divers remain under water from fifty to eighty seconds, though exceptional instances are cited of men remaining below for as long as six minutes. After resting for a minute or two at the surface, the diver descends again; and so on, until exhausted, when he comes on board and watches the rope, while his comrade relieves him as diver. The native descends naked, carrying only a girdle for the support of the basket in which he places the pearls. In his submarine work the diver makes skilful use of his toes. To arm himself against the attacks of the sharks and other fish which infest the Indian waters he carries spikes of iron; and the genuine Indian diver never descends without the incantations of shark-charmers, one of whom accompanies the boat while others remain on shore. As a rule the diver is a short-lived man.

The diving continues from sunrise to about noon, when a gun is fired. On the arrival of the fleet at shore the divers carry their oysters to a shed, where they are made up into four heaps, one of which is taken by the diver. The oysters are then sold by auction in lots of 1000 each. The pearls, after removal from the dead oysters, are "classed" by passing through a number of small brass colanders, known as "baskets," the holes in the successive vessels being smaller and smaller. Having been sized in this way, they are sorted as to colour, weighed and valued.

Since the days of the Macedonians pearl-fishing has been carried on in the Persian Gulf. It is said that the oyster-beds extend along the entire Arabian coast of the gulf, but the most important are on sandbanks off the islands of Bahrein. The chief centre of the trade is the port of Lingah. Most of the products of this fishery are known as "Bombay pearls," from the fact that many of the best are sold there. The shells usually present a dark colour about the edges, like that of "smoked pearl." The yellow-tinted pearls are sent chiefly to Bombay, while the whitest go to Bagdad. Very small pearls, much below a pea in size, are generally known as "seed-pearls," and these are valued in India and China as constituents of certain electuaries, while occasionally they are calcined for chusam, or lime, used with betel as a masticatory. There is a small pearl-fishery near Karachi on the coast of Bombay.

From the time of the Ptolemies pearl-fishing has been prosecuted along the coast of the Red Sea, especially in the neighbourhood of Jiddah and Koseir. This fishery is now insignificant, but the Arabs still obtain from this district a quantity of mother-of-pearl shells, which are shipped from Alexandria, and come into the market as "Egyptians." Very fine pearls are obtained from the Sulu Archipelago, on the north-east of Borneo. The mother-of-pearl shells from the Sulu seas are characterized by a yellow colour on the border and back, which unfit them for many ornamental purposes. Pearl oysters are also abundant in the seas around the Aru Islands to the south-west of New Guinea. From Labuan a good many pearl-shells are occasionally sent to Singapore. They are also obtained from the neighbourhood of Timor, and from New Caledonia. The pearl oyster occurs throughout the Pacific, mostly in the clear water of the lagoons within the atolls, though fine shells are also found in deep water outside the coral reefs. The Polynesian divers do not employ sink-stones, and the women are said to be more skillful than the men. They anoint their bodies with oil before diving. Fine pearl-shells are obtained from Navigators' Islands, the Society Islands, the Low Archipelago or Paumotu Isles, and the Gambier Islands. Many of the Gambier pearls present a bronzy tint.

Pearl-fishing is actively prosecuted along the western coast of Central America, especially in the Gulf of California, and to a less extent around the Pearl Islands in the Bay of Panama. The

PEARL
PEARL

fishing-grounds are in water about 40 ft. deep, and the season lasts for four months. An ordinary fishing-party expects to obtain about three tons of shells per day, and it is estimated that one such party could provide a ton of pearls. The shells are shipped in barrels from San Francisco and Panama. Some pearls of rare beauty have been obtained from the Bay of Mulege, near Los Coyotes, in the gulf of California; and in 1882 a pearl of 75 carats, the largest on record from this district, was found near La Paz in California. The coast of Guayaquil also yields pearls. Columbus found that pearl-fishing was carried on in his time in the Gulf of Mexico, and pearls are still obtained from the Caribbean Sea. In the West Indies the best pearls are obtained from St Thomas and from the island of Margarita, off the coast of Venezuela. From Margarita Philip II. of Spain is said to have obtained in 1579 a famous pearl of 250 carats.

Of late years good pearls have been found in Shark's Bay, on the coast of West Australia, especially in an inlet termed Useless Harbour. Mother-of-pearl shells are also fished at many other points along the western coast, between the 15th and 25th parallels of south latitude. An important pearl-fishery is also established in Torres Strait and on the coast of Queensland. The shells occur in water from four to six fathoms deep, and the divers are generally from 70 to 80 in number. According to the report of the famous English circumnavigator, Captain William Baffin, who visited the coast in 1721, the value of the pearl-fishery there in that year was estimated at about £12,000. This yield, however, was not maintained, and at the present time only a few pearls are obtained at irregular intervals by an occasional fisherman.

The principal rivers in Scotland which have yielded pearls are the Spey, the Tay and the South Esk; and to a less extent the Doon, the Dee, the Don, the Ythan, the Teith, the Firth and many other streams. In North Wales the Conway was at one time celebrated for its pearl-fishery. The finest pearls were obtained from the River Dee, and Sir Richard Wynn, chamberlain to the queen of Charles II. presented her with a Conway pearl which is believed to occupy a place in the British crown. In Ireland the rivers of Donegal, Tyrone and Wexford have yielded pearls. It is said that Sir John Hawkins the circumnavigator had a pearl for pearl-fishing in the It in Cumberland. Although the pearl-fisheries of Britain are now neglected, it is otherwise with those of Germany. The most important of these are in the forest-streams of Bavaria, where Rathschien and Passau are situated. The Saxony is chiefly confined to the basin of the White Elster, and those of Bohemia to the Horazdowitz district of Wotawa. For more than two centuries the Saxony fisheries have been carefully regulated by inspectors, who examine the streams every spring, and determine whether or not the fish have been artificially bred. In some cases it is left to rest for ten or fifteen years. The fisher-folk open the valves of the mussel with an iron instrument, and if they find no pearl restore the mussel to the water.

The pearl-fishers in many parts of the United States, and have been systematically worked in the Little Miami river, Warren county, Ohio, and also on the Mississippi, especially about Muscatine, Iowa. The season extends from June to October. Japan produced a good supply of pearls, and a species of Anodonta nipponia but it is in China that the culture of the pearl-mussel is carried to the greatest perfection. The Chinese also obtain marine pearls, and use a large quantity of mother-of-pearl for decorative purposes. The largest pearls of value are enumerated as a tribute or tax in China; and they are mentioned as products of the western part of the empire in the Ry oya, a dictionary compiled earlier than 1000 B.C. A process for promoting the artificial formation of pearls in the Chinese river-mussels was discovered by Ye-tin-yang, a native of Ho-how, in the 17th century; and this process is still extensively carried on near the city of Teh-ting, where it forms the staple industry of various villages, and is said to give employment to about 5000 people. Large numbers of the mussels are collected in May and June, and the valves of each are gently opened with a spatula to allow of the introduction of a forked bamboo stick. These mother-of-pearl matrices are gently rubbed against the side of the mussel, but may be small bosses of bone, brass or wood. After a number of these objects have been placed in convenient positions on one valve, the unfortunate mussel is turned over and the operation is repeated on the other valve. The mussels are then placed in shallow ponds connected with the canals, and are nourished by tubs of night-soil being thrown in from time to time. After several months, in some cases two or three years, the mussels are removed, and the pearls are obtained by opening them with the usual tools. If the shells, while the molluscs themselves serve as food. The matrix is generally extracted from the pearl and the cavity filled with white wax, the aperture being neatly sealed up so as to render the appearance of the pearls indistinguishable from that of genuine ones. Million of such pearls are usually sold at Soo-chow. The most curious of these Chinese pearls are those which present the form of small seated imagoes of Buddha. The figures are cast in very thin lead, or stamped in tin, and are inserted into the bases of the pearls.

According to the latest researches the cause of pearl-formation is in most cases, perhaps in all, the dead body of a minute parasite within the tissues of a mollusc, around which nacreous deposit is secreted. The parasite is a stage in the life history of a Trematode in some cases, in others of a Cestode; that is to say of a form resembling the common liver-fluke of the sheep, or of a tape- worm. As long ago as 1832 Filippi of Turin showed that the species of Trematode Distomum duplicatum was the cause of a pearl formation in the fresh-water mussel Anodonta. Kuchenmeister subsequently investigated the question at Elster in Saxony and came to a different conclusion, namely that the central body of the pearl was a small specimen of a species of water mite which is a very common parasite of Anodonta. Filippi however states that the mite is only rarely found within a pearl, the Trematode occurring in the great majority of cases. R. C. O. Willey and Dr H. Lyster Jameson have made special investigations of the process of pearl production by Mytilus edulis. The latter states that the pearl is produced in the mantle and is situated beneath the epidermis of the mantle and is lined by an epithelium. This epithelium is not derived from the cells of the epidermis but from the internal connective-tissue cells. This statement, if correct, is contrary to what would be expected, for calcareous matter is usually secreted by the external epidermis only. The sac or cyst is formed by the larva of a species of Trematode belonging to the genus Leucithodendrum, a species closely resembling and probably identical with L. somatiera, which lives in the adult state in the elder duck. At Billiers, Morbihan, in France, the host of the adult Trematode is another species of duck, namely the common Scoter, Oedemia nigra, which is notorious in the locality for its avidity for mussels. Tremato- dees of the family Distomidae, to which the parasite under consideration belongs, usually have three hosts in each of which they pass different stages of the life history. In this case the first host at Billiers is a species of bivalve called Tapes decussatus, but at Pied in Lancashire there are no Tapes and the first stages of the parasite are found in the common cockle. The Trematode relatives to the first host is a minute newly hatched embryo and 1. Distomum duplicatum, is a Gastropod belonging to the family Strombidae, of the order Pectinibranchia. Turbellaria, scolydry, Lam., is a Gastropod of the same order. 2. Placuna placentia, L., belongs to the family Anodonta; it is found on the shores of North Australia. Pinna squamosa, Gmelin, belongs to the Ostreae; it occurs in the Mediterranean. Both are Lamellibranchs.
Dr. Jameson distinguishes in addition to the above thirty-two species of Margaritifera or Meleagrina; all these have rudimentary teeth on the hinge. The most important species is Meleagrina vulgaris, to which belong the pearl oyster of Ceylon and southern India. Theling shell of the Persian Gulf and the pearl oyster of the Red Sea. Since 1857-1859, this species has invaded the Mediterranean, specimens having been taken at Alexandria and at Malta, and attempts have been made to cultivate it on the French coast. The species occurs also on the coasts of the Malaya Islands, at the northern coast of New Guinea, and in the Bay of isolated for its shells (Australian lingah) and for pearls. Two species occur on the coasts of South Africa but have no market value. Meleagrina sarcariarum is the Shark’s Bay shell of the London market. It is found in the lagoons in the Mascarene Islands, and is of rather small value; it also yields pearls of inferior quality. The pearl oyster of Japan, known as Japanese lingah, is probably a variety of Meleagrina vulgaris. Meleagrina radiata is the West Indian oyster.

The largest and steadiest consumption of mother-of-pearl is in the button trade, and much is also consumed by cutters for handles of fruit and dessert knives and forks, pocket-knives, &c. It is also used in the inlaying of Japanese and Chinese lacquers, European lacquered papier-mâché work, trays, &c., and as an ornamental inlay generally. The carving of pilgrim shells and the elaboration of crucifixes and ornamental work in mother-of-pearl is a distinctive industry of the monks and other inmates of Bethlehem. Among the South Sea Islands the shell is largely fashioned into diadems, pendants, and ornaments. Among shells other than those of Meleagrina margaritifera used as mother-of-pearl may be mentioned the Green Ear or Ormer shell (Haliotis orbicularis) and several other species of Haliotis, besides various species of Turbo.

Artificial pearls were first made in western Europe in 1860 by Jacquin, a rosary-maker in Paris, and the trade is now largely carried on in France, Germany and Italy. Spheres of thin glass are filled with a preparation of gum tragacanth, and then covered with silvery scales of the bleak or “albette,” which is caused to adhere to the inner wall of the globe, and the cavity is then filled with white wax. Many imitation pearls are now formed of an opaline glass, which is not so brilliant and clear as the genuine pearls, but is, on account of its surface, made to resemble the genuine by the judicious use of hydrofluoric acid. An excellent substitute for black pearl is found in the so-called “ironstone jewelry,” and consists of close-grained haematite, not highly polished; but the genuine pearl of the haematite immediately destroys the illusion. Pink pearls are imitated by turning small spheres out of the rosy part of the conch shell, or even out of pink coral.

into the stream that keeps him from her. In the very effort the dreamer awakes, to find himself resting upon the little mound where his Pearl had “strayed below”:—

“I roused me, and fell in great dismay,
And, sighing, to myself I said:
Now all be to that Prince’s pleasure.”

The poem consists of one hundred and one stanzas, each of twelve lines, with four accents, rhymed ab, ab, ab, ab, be, be; the versification combines rhyme with alliteration; tri-syllabic effects add to the easy movement and lyrical charm of the lines. Five stanzas (in one case six), with the same refrain, constitute a section, of which according to the main sequence being linked together by the device of making the first line of each stanza catch up the refrain of the previous verse, the last line of the poem re-echoing the first line. The author was not the creator of this form, nor was he the last to use it. The extant pieces in the metre are short religious poems, some of the later (e.g. God’s Complaint, falsely attributed to Scottish authorship) revealing the influence of Pearl.

The dialect is West Midland, or rather North-West Midland, and the vocabulary is remarkable for the blending of native speech with Scandinavian and Romance elements, the latter partly Anglo-French, and partly learned French, due to the author’s knowledge of French literature.

“While the rhyme of the poet,” according to Gollancz, “is a paraphrase of the closing chapters of the Apocalypse and the parable of the Vineyard, the poet’s debt to the Romant de la Rose is noteworthy, more particularly in the description of the wonderful land through which the dreamer wanders; and it can be traced throughout the poem, in the personification of Pearl as Reason, in the form of the colloquy, in the details of dress and ornament, in many a characteristic word, phrase and reference. ‘The river from the throne,’ in the Apocalypse, here meets ‘the waters of the wells’ devised by Sir Mirth for the Garden of the Rose. From these two sources, the Book of Revelation, with its almost Celtic glamour, and the Romant de la Rose, with its almost Oriental alliteration, are derived much of the wealth and brilliancy of the poem. The poet’s fancy revels in the richness of the heavenly and the earthly paradise, but his fancy is subdued to his earnestness and intensity.”

The leading motifs of Pearl are to be found in the Gospel—
in the allegory of the merchant who sold all his goods to purchase one pearl of great price, and in the words, so fraught with solace for the child-like: “for of the Kingdom of Heaven.” Naturally flowing from these themes, from these motifs, some theological problems of the time are touched upon, or treated somewhat too elaborately perhaps, and an attempt has been made to demonstrate that Pearl is merely allegorical and theological, and not really a lament.

Those who hold this view surely ignore or fail to recognize the subtle personal touches whereby the poem transcends all its theological interests, and makes its simple and direct appeal to the human heart. Herein, too, lies its abiding charm, over and above the poetical talent, the love of nature, colour and the picturesque, the technical skill, and the descriptive power, which in a high degree belonged to the unknown poet.

Various theories have been advanced as to the authorship of Pearl and the other poems in the manuscript. The claims of Huchoon “of the Awle Ryale” have been vigorously (but unsuccessfully) advocated; the case in favour of Ralph Strode (Chaucer’s ‘philosophical Strode’)—the most attractive of all the theories—is still, unfortunately, “not proven.” By piecing together the personal indications to be found in the poem, an imaginary biography of the poet may be conjectured. It may safely be inferred that he was born about 1330, somewhere in Lancashire, or a little to the north; that he delighted in open-air life, in woodcraft and sport; that his early life was passed amid the gay scenes that brightened existence in medieval hall and bower; that he availed himself of opportunities of study, theology and romance alike claiming him; that he wedded, and had a child named Margery or Marguerite—the Daisy, or the Pearl—at whose death his happiness drooped and life’s joy ended.

The four poems are closely linked and belong to one period of the poet’s career. In Gawwayne, probably the first of the four, the poet is still the minstrel rejoicing in the glamour of the Arthurian tale; in Gawwayne, in its Spenserian spirit, to point a moral. In Pearl the minstrel has become the elegiac poet, harmonizing the old Teutonic form with the newer Romance rhyme. In Cleanness he has discarded all attractions of form, and, in direct alliterative metre, a stern homily on chastity. In Patience—a homiletic paraphrase of Jonah—he appears to be autobiographical, reminding himself, while teaching others, that “Poverty and Patience are needs playfellows.” He had evidently fallen on evil days.

It is noteworthy that soon after 1338 Boccaccio wrote his Latin eclogue Olympia in memory of his young daughter Violante. A comparative study of the two poems is full of interest; the direct influence of the Latin on the English poem is not so clear as has been maintained. Pearl cannot be placed earlier than 1360; it is probably later than Olympia.

PEARSON, CHARLES HENRY (1830—1894), British historian and colonial statesman, was born in London on the 7th of September 1830. After receiving his early education at Rugby and King’s College, London, he went up to Oxford, where he
was generally regarded as the most brilliant of an exceptionally able set, and in 1854 obtained a fellowship at Oriel College. His constitutional weakness and bad eyesight forced him to abandon medicine, which he had adopted as a career, and in 1855 he returned to King’s College as lecturer in English language and literature, a post which he almost immediately quitted for the professorship of modern history. He made numerous journeys abroad, the most important being his visit to Russia in 1858, his account of which was published anonymously in 1859 under the title of Russia, by a Recent Traveller; an adventurous journey through Poland during the insurrection of 1863, of which he gave a sympathetic and much praised account in the Spectator; and a visit to the United States in 1868, where he gathered materials for his subsequent discussion of the negro problem in his National Life and Character. In the meantime, besides contributing regularly, first to the Saturday Review and then to the Spectator, and editing the National Review, he wrote the first volume of The Early and Middle Ages of England (1861). The work was bitterly attacked by Freeman, whose “extra-convert Saxonism” Pearson had been unable to adopt. It appeared in 1868 in a revised form, with the title of History of England during the Middle Ages (1866–73). He then prepared the second volume which met with general recognition. Still better was the reception of his admirable Maps of England in the First Thirteen Centuries (1870). But as the result of these labours he was threatened with total blindness; and, disappointed of receiving a professorship at Oxford, in 1871 he emigrated to Australia. Here he married and settled down to the life of a sheep-farmer; but finding his health and eyesight greatly improved, he came to Melbourne as lecturer on history at the university. Soon afterwards he became head master of the Presbyterian Ladies’ College, and in this position practically organized the whole system of higher education for women in Victoria. On his election in 1878 to the Legislative Assembly he definitely adopted politics as his career. His views on the land question and secular education aroused the bitter hostility of the rich squatters and the clergy; but his singular nobility of character, no less than his powers of mind, made him one of the most influential men in the Assembly. He was minister without portfolio in the Berry cabinet (1880–1881), and as minister of education in the coalition government of 1886 to 1889 he was able to pass into law many of the recommendations of his report. His reforms entirely remodelled state education in Victoria. In 1892 a fresh attack of illness decided him to return to England. Here he published in 1893 the best known of his works, National Life and Character. It is an attempt to show that the white man can flourish only in the temperate zones, that the yellow and black races must increase out of all proportion to the white, and must in time crush out his civilization. He died in London on the 20th of May 1894.

A volume of his Reviews and Critical Essays was published in 1896, and was followed in 1900 by his autobiography, a work of great interest.

PEARSON, JOHN (1612–1686), English divine and scholar, was born at Great Snoring, Norfolk, on the 28th of February 1612. From Eton he passed to Queen’s College, Cambridge, and was elected a scholar of King’s in April 1632, and a fellow in 1634. On taking orders in 1639 he was collated to the Salisbury prebend of Nether-Avon. In 1640 he was appointed chaplain to the lord-keeper Finch, by whom he was presented to the living of Thornton-in-Suffolk. In the Civil War he acted as chaplain to Sir George Villiers’ horse. In 1644 he was made a regular preacher at St Clement’s, Eastcheap, in London. With Peter Gunning he disputed against two Roman Catholics on the subject of schism, a one-sided account of which was printed in Paris by one of the Roman Catholic disputants, under the title Scisme Unmaskt (1658). Pearson also argued against the Puritan party, and was much interested in Brian Walton’s polyglot Bible. In 1659 he published in London his celebrated Exposition of the Creed, dedicated to his patronishers of St Clement’s, Eastcheap, to whom the substance of the work had been preached several years before. In the same year he published the Golden Remains of the ever-memorable Mr John Hales of Eton, with an interesting memoir. Soon after the Restoration he was presented by Juxon, bishop of London, to the rectory of St Christopher-le-Stocks; and in 1660 he was created doctor of divinity at Cambridge, appointed a royal chaplain, prebendary of Ely, archdeacon of Surrey, and master of Jesus College, Cambridge. In 1661 he was appointed Lady Margaret professor of divinity; and on the first day of the ensuing year he was nominated one of the commissioners for the review of the liturgy in the conference held at the Savoy. There he won the esteem of his opponents and high praise from Richard Baxter. On the 14th of April 1662 he was made master of Trinity College, Cambridge. In 1667 he was admitted a fellow of the Royal Society. In 1672 he published at Cambridge Vindiciae epistolarii S. Ignatii, in 4to, in answer to Jean Daillé. His defence of the authenticity of the letters of Ignatius has been confirmed by J. B. Lightfoot and other recent scholars. Upon the death of John Wilkins in 1672, Pearson was appointed to the bishopric of Chester. In 1682 his Annales cyprianci were published at Oxford, with John Fell’s edition of that father’s works. He died at Chester on the 16th of July 1686. His last work, ”the Two Dissertations on the Succession and Time of the First Five Bishops of Rome,” formed with the Annales Pavonini the principal part of his Opera posthuma, edited by Henry Dodwell in 1688.

See the memoir in Biographia Britannica, and another by Edward Churton, prefixed to the edition of Pearson’s Minor Theological Works (2 vols., Oxford, 1844). Churton also edited almost the whole of the theological writings.

PEARSON, JOHN LOUGHBOURGH (1817–1897), English architect, son of William Pearson, etcher, of Durham, was born in Brussels on the 4th of July 1817. He was articled at the age of fourteen to Ignatius Bonomi, architect, of Durham, but soon returned to London, and worked under the elder Hardwicke. He revived and practised largely the art of vaulting, and acquired in it a proficiency unrivalled in his generation. He was, however, by no means a Gothic purist, and was also fond of Renaissance and thoroughly grounded in classical architecture. From the erection of his first church of Eweller, in Yorkshire, in 1843, to that of St Peter’s, Vauxhall, in 1864, his buildings are Geometrical in manner and exhibit a close adherence to precedent, but elegance of proportion and refinement of detail lift them above the commonplace of mere imitation. His Trinity, Westminster (1848), and St Mary’s, Dalton Holme (1858), are notable examples of this phase. St Peter’s, Vauxhall (1864), his first groined church, was also the first of a series of buildings which brought Pearson to the forefront among his contemporaries. In these he applied the Early English style to modern needs and modern economy with unrivalled success. St Augustine’s, Kilburn (1871), St John’s, Red Lion Square, London (1874), St Alban’s, Birmingham (1880), St Michael’s, Croydon (1880), St John’s, Norwood (1881), St Stephen’s, Bournemouth (1886), and All Saints’, Hove (1889), are characteristic examples of his matured work. He is best known by Truro Cathedral (1886), which has a special interest in its apt incorporation of the south aisle of the ancient church. Pearson’s conservative spirit fitted him for the reparation of ancient edifices, and among cathedrals and other historical buildings placed under his care were Lincoln, Chichester, Peterborough, Bristol and Exeter Cathedrals, St George’s Chapel, Windsor, Westminster Hall and Westminster Abbey in the surveyorship of which he was associated with Sir G. Scott. Except as to the porch of the work of Scott, he re-faced the north transept of Westminster Abbey, and also designed the vigorous organ cases. In his handling of ancient buildings he was repeatedly opposed by the ultra anti-restorers (as in the case of the west front of Peterborough Cathedral in 1866), but he generally proved the soundness of his judgment by his executed work. Pearson’s practice was not confined to church building. Treverbyfd House (1850), Quar Wood (1858), Lechale Manor, an Elizabethan house (1873), Westwood House, Sydenham, in the French Renaissance style (1886), the Astor estate offices (1892) upon the Victoria
Embarkment, London, the remodelling of the interiors of Chevening House (1893) and No. 18 Carlton House Terrace (1894), with many personages, shows his aptitude for domestic architecture. In general design he first aimed at form, embracement of proportion and contour; and his work may be recognized by accurate scholarship coupled with harmonious detail. Its keynotes are cautiousness and refinement rather than boldness. He died on the 11th of December 1897, and was buried in the nave of Westminster Abbey, where his grave is marked by the appropriate motto Sustinui et abstinui. He was elected A.R.A. in 1874, R.A. in 1880, a fellow of the Society of Antiquaries, and a fellow and member of the Council of the Royal Institute of British Architects.

The following are some of Pearson's more important works, not already named: Perrthy church (1846); Stow, Lincolnshire (restoration, 1850); Weybridge, St James's (1853); Freeland church, parsonage and schools (1866); Kilburn, St Peter's (restoration, 1873); Wentworth church (1872); Horsforth church (1874); Cullercoats, St George's (1882); Chiswick, St Michael's (restoration, 1882); Great Yarmouth church (restoration, 1885); Liverpool, St Agnes (1883); Woking Convalescent Home (1884); Headingley church (1884); Torquay, All Saints (1884); Malahide, All Saints (restoration, 1885); Shrewsbury Abbey (1886); Ayr, Holy Trinity (1886); Hyde church (restoration, 1887); Oxford, New College, residences (completion, 1889); Cambridge University Library (additions, 1889); Frieth, St Michael's (restoration, 1890); Middlesex Hospital chapel (1890); Bishophgate, St Helen's (restoration, 1891); Maid Hy (Irvingite) church (1891); Barking, All Hallows (restoration, 1893); Cambridge, Emmanuel College (additions, 1893); Letchworth, St Michael's (1894); Malvern, Memorial Church (1894); Port Talbot church (1895).

PEARY, ROBERT EDWIN (1856– ), American Arctic explorer, was born at Cresson, Pennsylvania, on the 6th of May 1866. He graduated at Bowdoin College in 1877, and in 1881 became a civil engineer in the U.S. navy with the rank of lieutenant. In 1884 he was appointed assistant-engineer in connexion with the surveys for the Nicaragua Ship Canal, and in 1887–1888 he was in charge of these surveys. In 1886 he obtained leave of absence for a summer excursion to disco Bay on the west coast of Greenland. From this point he made a journey of nearly a hundred miles into the interior, and the experience impressed him with the practicability of using this so-called inland ice-cap as a highway for exploration. In 1891 he organized an expedition under the auspices of the Academy of Natural Sciences of Philadelphia. The party of seven included Lieut. Peary's wife, the first white woman to accompany an Arctic expedition. After wintering in Inglefield Gulf on the north-west coast of Greenland, in the following spring Lieut. Peary, with a young Norwegian, Eivind Astrup, crossed the inland ice-cap to its northern limit to the north-west of Greenland and back. The practical geographical result of this journey was to establish the insularity of Greenland. Valuable work was also performed by the expedition in the close study which was made of the isolated tribe of the Cape York or Smith Sound Eskimos, the most northerly people in the world.1 Lieut. Peary was able to fit out another Arctic expedition in 1893, and was again accompanied by Mrs Peary, who gave birth to a daughter at the winter quarters in Inglefield Gulf. The expedition returned in the season of 1894, leaving Peary with his coloured servant Henson and Mr Hugh G. Lee to renew the attempt to cross the inland ice in the next year. This they succeeded in doing, but without being able to carry the work of exploration any farther on the opposite side of Greenland.

During a summer excursion to Melville Bay in 1894, Peary discovered three large meteorites, which supplied the Eskimos with the material for their iron implements, as reported by Sir John Ross in 1818, and on his return in 1895 he brought the two smaller ones with him. The remaining meteorite was brought to New York in 1897. In 1898 Lieut. Peary published Northward over the Great Ice, a record of all his expeditions up to that time, and in the same year he started on another expedition to the Arctic regions. In this and subsequent expeditions he received financial aid from Mr Morris Jesup, and the New York Arctic Club. He was now bestowing upon the organization of the expedition, a four-years' programme being laid down at the outset and a system of relief expeditions provided for. A distinctive feature was the utilization of a company of Eskimos. Although unsuccessful as regards the North Pole, the expedition achieved the accurate survey (1900) of the northern limit of the Greenland continent and the demonstration that beyond it lay a Polar ocean. In 1902 Peary with Henson and an Eskimo advanced as far north as lat. 84° 17' 27", the highest point then reached in the western hemisphere. Lieut. Peary had now been promoted to the rank of Commander, and on his return he was elected president of the American Geographical Society.

In November 1903 he went to England on a naval commission to inquire into the system of naval barracks in Great Britain, and was presented with the Livingstone Gold Medal of the Royal Scottish Geographical Society. Commander Peary then began preparations for another expedition by the construction of a special ship, named the "Roosevelt," the first ever built in the United States for the purpose of Arctic exploration. He sailed from New York on the 16th of July 1905, having two years' supplies on board. The "Roosevelt" wintered on the north coast of Grant Land, and on the 21st of February a sledge party was made with sledges. The party experienced serious delay owing to open water between 84° and 85° N., and farther north the ice was opened up during a six days' gale, which cut off communications and destroyed the dépôts which had been established. A steady easterly drift was experienced. But on the 21st of April, 1906, 85° 6' was reached—the "farthest north" attained by man—by which time Peary and his companions were suffering severe privations, and had to make the return journey in the face of great difficulties. They reached the north coast of Greenland and subsequently rejoined the ship, from which, after a week's rest, Peary made a sledge journey along the north coast of Grant Land. Returning home, the expedition reached Hebron, Labrador, on the 13th of October, the "Roosevelt" having been nearly wrecked en route. In 1907 the narrative of this journey, Nearest the Pole, was published.

In 1908 Peary started in the "Roosevelt" on the journey which was to bring him his final success. He left Etah on the 18th of August, wintered in Grant Land, and set forward over the ice from Cape Columbia on the 1st of March 1908. A party of six started with him, and moved in sections, one in front of another. They were gradually sent back as supplies diminished. At the end of the month Captian Bartlett was the only white man left with Peary, and he returned back in 87° 48' N., the highest north latitude then ever reached. Peary, with his negro servant and four Eskimos, pushed on, and on the 6th of April 1909 reached the North Pole. They remained some thirty hours, took observations, and on sounding, a few miles from the pole, found no bottom at 100 fathoms. The party, with the exception of one drowned, returned safely to the "Roosevelt," which left her winter quarters on the 18th of July and reached Indian Harbour on the 5th of September. Peary's The North Pole: Its Discovery in 1909 was published in 1910.

Just before the news came of Peary's success another American explorer, Dr F. A. Cook (b. 1863), returning from Greenland to Europe on a Danish ship, claimed that he had reached the North Pole on the 21st of April 1908. He had accompanied an expedition northward in 1907, prepared to attempt to reach the Pole if opportunity offered, and according to his own story had done so, leaving his party and taking only some Eskimos, early in 1908. Nothing had been heard of him since March of that year, and it was supposed that he had perished. Cook's claim has been forestalled Peary was at first credited in various circles, and he was given a rapturous reception at Copenhagen; but scientific opinion in England and America was more reserved, and eventually, after a prolonged dispute, a special committee of the university of Copenhagen, to whom his documents were submitted, declared that they
contained no proof that he had reached the Pole. By that time most other people had come to an adverse conclusion and the sensation was over.

PEASANT (O. Fr. paysant, Mod. paysan; Lat. paganus, belonging to the pagus or country; cf. "pagan"), a countryman or rustic, either working for others, or, more specifically, owning or renting and working by his own labour a small plot of ground. Though word of not very strict application, it is now frequently used of the rural population of such countries as France, where the land is chiefly held by small holders, "peasant proprietors." (See ALLOTMENTS and METAYAGE).

PEASE, EDWARD (1767-1838), the founder of a famous industrial Quaker family in the north of England, was born at Darlington on the 31st of May 1767, his father, Joseph Pease (1737-1808), being a woollen manufacturer in that town. Having retired from this business Edward Pease made the acquaintance of George Stephenson, and with him took a prominent part in constructing the railway between Stockton and Darlington. He died at Darlington on the 31st of July 1858. His second son, Joseph Pease (1799-1874), who assisted his father in his railway enterprises, was M.P. for South Durham from 1832 to 1841, being the first Quaker to sit in parliament. He was interested in collieries, quarries and ironstone mines in Durham and North Yorkshire, as well as in cotton and woollen manufacture; and he was active in educational and philanthropic work. Another son, Henry Pease (1807-1881), was M.P. for South Durham from 1857 to 1865. Like all the members of his family he was a supporter of the Peace Society, and in its interests he visited the emperor Nicholas of Russia just before the outbreak of the Crimean War, and later the emperor of the French, Napoleon III.

Joseph Pease's eldest son, Sir Joseph Whitwell Pease (1828-1901), was made a baronet in 1882. He was M.P. for South Durham from 1863 to 1885 and for the Barnard Castle division of Durham from 1885 to 1903. His elder son, Sir Alfred Edward Pease (b. 1857), who succeeded to the baronetcy, became famous as a hunter of big game, and was M.P. for York from 1855 to 1892 and for the Cleveland division of Yorkshire from 1897 to 1902. A younger son, Joseph Albert Pease (b. 1860), entered parliament in 1892, and in 1906 became chief Liberal whip, being advanced to the cabinet as chancellor of the duchy of Lancaster in 1916.

Another son of Joseph Pease was Arthur Pease (1837-1893), member of parliament from 1880 to 1885 and again from 1895 to 1898. His son, Herbert Pike Pease (b. 1867), M.P. for Darlington 1898-1910, was one of the Unionist Whips.

The Diaries of Edward Pease were edited by Sir Alfred Pease in 1907.

PEAT (possibly connected with Med. Lat. petra, peccia, piece, ultimately of Celtic origin; cf. O. Celt. pet, O. Ir. pít, Welsh peth, portion), a product of decayed vegetation found in the form of bogs in many parts of the world. The continent of Europe is estimated to contain 2,172,700 sq. m. of bog; Ireland has 2,865,150 acres, Canada 30,000,000 acres, and the United States 20,000,000 acres. The plants which give origin to these deposits are mainly aquatic, including reeds, rushes, sedges and mosses. <i>Sphagnum</i> is present in most peats, but in Irish peat <i>Thamnobium</i> and other genera predominate. It seems that the disintegration of the vegetable tissues is effected partly by moist atmospheric oxidation and partly by anaerobic bacteria, yeasts, moulds and fungi, in depressions containing fairly still but not stagnant water, which is retained by an impervious bed or underlying strata. As decomposition proceeds the products become waterlogged and sink to the bottom of the pool; in the course of time the deposits attain a considerable thickness, and the lower layers, under the superincumbent pressure of the water and later deposits, are gradually compressed and carbonized. The most favourable conditions appear to be a moist atmosphere, and a mean annual temperature of about 45° F; no bogs are found between latitudes 45° N. and 45° S.

PEAT varies from a pale yellow or brown fibrous substance, resembling turf or compressed hay, containing conspicuous plant remains, to a compact dark brown material, resembling black clay when wet, and some varieties of lignite when dry. Two typical forms may be noticed: "Hill peat" (the mountain or brown bogs of Ireland), found in mountainous districts, and consisting mainly of <i>Sphagnum</i> and <i>Andromeda</i>; and "Bottom peat" (the lowland or red bogs of Ireland), found in lakes, rivers, and brooks, and consisting of <i>Hypnum</i> and other mosses containing 90% water, which is necessary to remove before the product can be efficiently employed as a fuel, and for most other purposes. A specimen dried at 100° C. had the composition: carbon = 60-64%, hydrogen = 6-10%, oxygen = 32-55%, nitrogen = 0-88%, ash = 3-96%; the ash is very variable—from 1 to 65%—and consists principally of clay and sand, with lesser amounts of ferric oxide, lime, magnesia, &c. The specific gravity has been variously given, owing to the variable water content and air spaces; when dried and compressed, however, it is denser than water.

PEAT-winning presents certain special features. The general practice is to cut a trench about a foot deep with a peculiarly shaped spade, termed in Ireland a "slane," and remove sods from 3 to 4 ft. long. When one layer has been removed, the next is attacked, and so on. If the deposit be more solid step-working may be adopted, and should water be reached recourse may be had to long-handled slanes. The layers are allowed to dry, and are then worked in shallow trenches, and the air, being occasionally turned so as to dry equally; this process may require about six weeks. The dried sods are known as "dug peat." Excavators and dredges are now extensively used, and the drying is effected in heated chambers, both fixed and revolving.

The low value of ordinary dug peat as a fuel has led to processes for obtaining a more useful product. In M. Eketen's process the peat is pulped and the pulps are collected and the uniform composition, and the pulp passed into an oven maintained at 180°-200° F., where it is carbonized by superheated water. The pressed product, which resembles lignite, still contains 8 to 14% of water; this is driven off by heat, and the residue briquetted. The final product nearly equal to coal in caloric value, and has the additional advantage of a lower sulphur content—0-2 to 0-4% against about 2% in ordinary coal. M. Zeiger's method leads to the production of a useful coke. Both these processes permit the recovery of valuable by-products such as sulphuric, &c. Experiments for obtaining a gas suitable for consumption in gas-engines have been followed by commercial processes devised by the Mond Gas Corporation, London, and Crossley Bros. of Manchester, &c. Processes of recovering amyl alcohol from peat are also extensively used. The conversion of peat into amines and aniline is a subject of much work, and is commercially pursued at works at Carnlough, Co. Antrim, under patents held by H. C. Woltereck. The peat is treated with a mixture of air and water vapour in special furnaces, and the gaseous products, including paraffin tar, acetic acid and ammonia, are led through a special scrubber to remove the tar, then through a tower containing milk of lime to absorb the acid (the calcium acetate formed being employed for the manufacture of acetic acid, &c.), and finally through a sulphuric acid tower, where the ammonia is converted into ammonium sulphate which is recovered by crystallization.

PEAT has also been employed as a source of commercial alcohol. Tests have been made with peat in this direction, but the experiments of R. W. Wallace and Sir W. Ramsay, which give 25 to 26 gallons of spirit from a ton of peat, the peat is boiled with water containing a little sulphuric acid, the product neutralized with ammonia, and then distilled. The ammonia is also recovered, in another process a yield of 40 gallons of spirit and 66 lb of ammonium sulphate per ton of peat is claimed.

Of other applications we may notice C. E. Nelson's process for making paper and Grazia, a process which has been commercialized. In another process a yield of 40 gallons of spirit and 66 lb of ammonium sulphate per ton of peat is claimed.

See P. R. Björing and F. T. Gissing, Peat and its Manufacture (1907); F. T. Gissing, Commercial Peat (1909); E. Nystrom, Peat and Lignite (1908), published by Department of Mines of Canada.

PÉCAUT, FELIX (1828-1888), French educationalist, a member of an old Huguenot family, was born at Salies de Béarn, in 1828. He was for some months evangelist pastor, but he had no pretence of sympathy with ecclesiastical authority
He was consequently compelled to resign his pastorate, and for some years occupied himself by urging the claims of a liberal Christianity. In 1879 he conducted a general inspection of primary education for the French government, and several similar missions followed. His fame chiefly rests in his successful organization of the training school for women teachers at Fontenoy-aux-Roses, to which he devoted fifteen years of ceaseless toil. He died on the 31st of July 1898.

A summary of his educational views is given in his Public Education and National Life (1897).

PECCARY, the name of the New World representatives of the swine (Suidae) of the E. hemisphere, of which they constitute the sub-family Dicotylinae (or Tagassinae). (See Artiodactyla and Swine.)

The teeth of the peccaries differ from those of the typical Old World pigs (Sus), numerically, in wanting the upper outer incisor and the anterior premolar on each side of each jaw, the dental formula being: i. 3, c. 1, p. 3, m. 3, total 38. From those of all Old World swine or Suinae, the upper canines, or tusks, differ in having their points directed downwards, not outwards or upwards; these being very sharp, with cutting hinder edges, and completely covered with enamel until worn. The lower canines are large and directed upwards and outwards, and slightly curved backwards. The cheek-teeth form a continuous series, gradually increasing in size from the first to the last: the molars having square four-cusped crowns. The stomach is much more complex than in the true pigs, almost approaching that of a ruminant. In the feet the two middle (third and fourth) metacarpal and metatarsal bones, which are completely separate in the pigs, are united at their upper ends. On the fore-foot the two (second and fifth) outer toes are equally developed as in pigs, but on the hind-foot, although the inner (or second) is present, the outer or fifth toe is entirely wanting. As in all Suidae the snout is truncated, and the nostrils are situated in its flat, expanded, disk-like termination. The ears are rather small, ovate and erect; and there is no external appearance of a tail.

Peccaries, which range from New Mexico to Texas to Patagonia, are represented by two main types, of which the first is the collared peccary, Dicotyles (or Tagassu) tajacu, which has an extensive range in South America. Generally it is found singly or in pairs, or at most in small herds of from eight to ten, and is not inclined to attack other animals or human beings. Its colour is dark grey, with a white or whitish band passing across the chest from shoulder to shoulder. The length of the head and body is about 36 in. The second form is typified by the white-lipped peccary or warri, B. (or T.) labiatus, or pocari, representing the sub-genus Olidessus. Typically it is rather larger than the collared species, being about 40 in. in length, of a blackish colour, with the lips and lower jaw white. It is not found farther north than Guatemala, or south of Paraguay. Generally met with in large droves of from fifty to a hundred, it is of a more pugnacious disposition than the former species, and the hunter who encounters a herd in a forest has often to climb a tree as his only chance of safety. Peccaries are omnivorous, living on roots, fallen fruits, worms and carrion, and often inflict great devastation upon crops. Both types are so nearly allied that they will breed together freely in captivity. Unlike pigs, they never appear to produce more than two young ones at a birth.

Remains of extinct peccaries referable to the modern genus occur in the caverns and superficial deposits of South America, but not in the earlier formations. This, coupled with the occurrence of earlier types in North America, indicates that the group is a northern one. Of the extinct North American peccaries, the typical Dicotyles occur in the Pliocene while the Miocene Bothriolabis, which has tusks of the peccary type, approximates in the structure of its cheek-teeth to the European Miocene genus among the Suinae. From this it may be inferred that the ancestral peccaries entered America in the Upper Eocene. Platygonus is an aberrant type which died out in the Pleistocene.

Pechlin, Karl Fredrik (1770–1796), Swedish politician and demagogue, son of the Holstein minister at Stockholm, was educated in Sweden, and entered the Swedish army. He rose to be a major-general, but became famous by being the type par excellence of the corrupt and egotistical Swedish parliamen- tarian of the final period of the Rikstidens (see Swedenc. History); he received for many years the sobriquet of "General of the Riksdag." Pechlin first appears prominently in Swedish politics in 1760, when suddenly changing sides he contrived to save the "Hats" from impeachment. Enraged at being thus excluded from power by their former friend, the "Caps" procured Pechlin's expulsion from the two following Riksdags. In 1760 Pechlin sold the "Hats" as he had formerly sold the "Caps," and was largely instrumental in preventing the projected indepsensible reform of the Swedish constitution. During the revolution of 1772 he escaped from Stockholm and kept quietly in the background. In 1786, when the opposition against Gustavus III. was gathering strength, Pechlin reappeared in the Riksdag as one of the leaders of the malcontents, and is said to have been at the same time in the pay of the Russian court. In 1786 he was one of the deputies whom Gustavus III. kept under lock and key till he had changed the government into a semiabsolute monarchy. It is fairly certain that Pechlin was at the bottom of the plot for murdering Gustavus in 1792. On the 1st of October, 1792, the two principal conspirators met at his house to make their final preparations and discuss the form of government which should be adopted after the king's death. Pechlin undertook to crowd the fatal masquerade with accomplices, but took care not to be there personally. He was arrested on the 17th of March, but nothing definite could ever be proved against him. Nevertheless he was condemned to imprisonment in the fortress of Varberg, where he died four years later.

See R. N. Bain, Gustavus III. and his Contemporaries (London, 1905).

PECHORA, a river of N. Russia, rising in the Urals, almost on 62° N., in the government of Perm. It flows W. for a short distance, then turns N. and maintains that direction up to about 60° 20' N. It then describes a double loop, to N. and to S., and after that resumes its N. course, finally emptying into the Gulf of Pechora, situated between the White Sea and the Kara Sea. Its total length is 970 m. At its mouth it forms an elongated delta. Although frozen in its upper reaches for 190 days in the year and for 138 days in its lower reaches, it is navigable throughout the greater part of its course. Its drainage basin covers an area of 137,700 sq. m. The principal tributaries are, on the right, the Ilych and the Usa, and on the left the Izma, the Tsylna and the Sula.

PECK, a dry measure of capacity, especially used for grain. It contains 8 quarts or 2 gallons, and is ⅓ of a bushel. The
imperial peck contains 554.548 cub. in., in the United States of America 537.6 cub. in. The word is in M.E. pek, and is found Latinized as peccum or pecca. In Med. Lat. are found picotinus, “mensura frumentaria,” and piculus, “mensura liquidorum” (Du Cange, Gloss. s.v.). These words seem to be connected with the Fr. picoter, to peck, of a bird, and this would identify the word with “pek,” a variant of “pick,” a tap or stroke of the beak, especially used of the action of a bird in picking up grain or other food. The sense-development in this case is very obscure, and the name of the measure is found much earlier than “pek” as a variant form of “pick.”

PECKHAM, JOHN (d. 1292), archbishop of Canterbury, was probably a native of Sussex, and received his early education from the Cluniac monks of Lewes. About 1250 he joined the Franciscan order and studied in their Oxford convent. Shortly afterwards he returned to England, and in 1279 took his degree under St. Bonaventure and became regent in theology. For many years Peckham taught at Paris, coming into contact with the greatest scholars of the day, among others St. Thomas Aquinas. About 1270 he returned to Oxford and taught there, being elected in 1275 provincial minister of the Franciscans in England, but he was so soon afterwards called to Rome as lector sacri palatii, or theological lecturer in the schools of the papal palace. In 1279 he returned to England as archbishop of Canterbury, being appointed by the pope on the rejection of Robert Burnell, Edward I’s candidate. Peckham was always a strenuous advocate of the papal power, especially as shown in the council of Lyons in 1274. His enthronement in October 1279 marks the beginning of an important epoch in the history of the English primacy. Its characteristic note was an insistence on discipline which offended contemporaries. Peckham’s zeal was not tempered by discernment, and he had little gift of sympathy or imagination. His first act on arrival in England was to call a council at Reading, which met in July 1279. Its main object was ecclesiastical reform, but the provision that a copy of Magna Carta should be hung in all cathedral and collegiate churches seemed to the king a political action, and parliament declared void any action of this council touching on the royal power. Nevertheless Peckham’s relations with the king were often cordial, and Edward called on him for help in bringing order into conquered Wales. The chief note of his activity was, however, certainly ecclesiastical. The crime of “plurality,” the holding by one cleric of two or more benefices, was especially attacked, as also clerical absenteeism and ignorance, and laxity in the monastic life. Peckham’s main instrument was a minute system of “visitations,” which he used with a frequency hitherto unknown. Disputes resulted, and on some points Peckham gave way, but his powers as papal legate complicated matters, and he did much to strengthen the court of Canterbury at the expense of the lower courts. The famous quarrel with St Thomas of Cantilupe, bishop of Hereford, arose out of similar causes. A more attractive side of Peckham’s career is his activity as a writer. The numerous manuscripts of his works to be found in the libraries of Italy, England and France, testify to his industry as a philosopher and commentator. In philosophy he represents the Franciscan school which attacked the teaching of St Thomas Aquinas on the “Unity of Form.” He wrote in a quaint and elaborate style on scientific, scriptural and moral subjects and engaged in much controversy in defence of the Franciscan rule and practice. He was an excellent maker of songs, and his hymns are characterized by a lyrical tenderness which seems typically Franciscan. Printed examples of his work as commentator and hymn writer respectively may be found in the Fimbriamentum trium ordinum (Paris, 1512), and his office for Trinity Sunday in the “unreformed” breviary.

PECKHAM—PECORA

PECOCK (or PECKHAM), REGINALD (c. 1392–c. 1460), English prelate and writer, was probably born in Wales, and was educated at Oriel College, Oxford. Having been ordained priest in 1421, he secured a mastership in London in 1431, and soon became prominent by his attacks upon the religious position of the Lollards. In 1444 he became bishop of St Asaph, and six years later bishop of Chichester. He was an adherent of the house of Lancaster and in 1454 became a member of the privy council. In attacking the Lollards Peckham put forward religious views far in advance of his age. He asserted that the Scriptures were not the only standard of right and wrong; he questioned some of the articles of the creed and the infallibility of the Church; he wished “bi cleer witte drawe men into contente of trewe feith otherwise than bi fire and swerd or hangsment” and in general he exalted the authority of reason. Owing to these views he was excommunicated by Thomas Boylston, and his writings to be examined. This was done and he was found guilty of heresy. He was removed from the privy council and he only saved himself from a painful death by privately, and then publicly (at St Paul’s Cross, Dec. 4, 1457), renouncing his opinions. Peckham, who has been called “the only great English theologian of the 15th century,” was then forced to resign his bishopric, and was removed to Thorney Abbey in Cambridgeshire, where he doubtless remained until his death. The bishop’s chief work is the famous Repressor of over-much writing [blaming] of the Clerge, which was issued about 1455. In addition to its great interest in the history of the Lollard movement the Repressor has an exceptional interest as a model of the English of the time, Peckham being one of the first writers to use the vernacular. In thought and style he was the work of a man of learning and ability.

A biography of the author is added to the edition of the Repressor published by C. Babington for the Rolls Series in 1860. Peckham’s other writings include the Book or Rule of Christian Religion; the Donet, an introduction to the chief truths of the Christian faith which is a forerunner of the Dialogus de Donet. The Pecorum of the Donet. The two last works are extant in manuscript. His Book of Faith has been edited from the manuscript in the library of Trinity College, Cambridge, by J. L. Morison (Glasgow, 1909). See also John Lewis, Life of Peckham (1744; new ed., 1820).

PECORA (plural of Lat. pecus, cattle), a term employed—in a more restricted sense—in place of the older title Ruminantia, to designate the group of ruminating artiodactyle ungulates represented by oxen, sheep, goats, antelopes, deer, giraffes, &c.

The leading characteristics of the Pecora are given in some detail in the article ARTIODACTYLA (q.v.); but it is necessary to allude to a few of these here. Pecora, or true ruminants as they may be conveniently called, have complex stomachs and chew the cud; they have no upper incisor teeth; and the lower canines are approximated to the outer incisors in such a manner that the three incisors and the one canine of the two sides collectively form a continuous semicircle of four pairs of nearly similar teeth. In the cheek-teeth the component columns are crescent-shaped, constituting the selenodont type. In the forelimbs the bones corresponding to the third and fourth metacarpals of the pig’s foot are fused into a cannon-bone; and a similar condition obtains in the front pair of the corresponding metatarsals to the skull; and the condyle of the lower jaw is transversely elongated. Another general, although not universal, characteristic of the Pecora is the presence of simple or complex appendages on the forehead commonly known as horns. In a few existing species, such as the musk-deer and the water-deer, these appendages are absent, and they are likewise lacking in a large number of extinct members of the group, in fact in all the earlier ones. They are, therefore, a specialized feature, which has only recently attained its full development.

These horns present several distinct structural types, which may be classified as follows:—

1. The simplest type is that of the giraffe, in which three bony prominences—a single one in front and a pair behind—are separate from the underlying bones and covered during life with skin, occupy the front surface of the skull. The summits of the hind pair are surmounted by bristly hairs. In the extinct
PECORA

Sivatherium there are two pairs of such appendages, of which the hinder are large and were probably covered during life either with skin or thin horn. In the giraffes the separation of the horns from the skull may be a degenerate character.

II. In the Asiatic muntjac deer we find a pair of skin-covered horns, or 'pedicles,' corresponding to the paired horns of the giraffe, although welded to the skull. From the summits of these pedicles arise secondary outgrowths, at first covered with skin, which (owing to the growth of a ring of bone at the base arresting the flow of blood) eventually dries up and leaves bare bone incapable of further growth. In the muntjac the bare bony part, or 'antler,' is small in proportion to the skin-covered pedicle, and simple in structure; but in the majority of deer the antler increases in size at the expense of the pedicle—which dwindles—and in some species, like the Siamese deer (fig. 1), the sambar and the red deer, becomes very large and more or less branched. Owing to liability to necrosis, the permanent retention of such a mass of dead bone would be dangerous; and the antlers are consequently shed annually (or every few years), to be renewed the following year, when, till the animal becomes past its prime, they are larger than their predecessors. The periodical shedding is also necessary in order to allow of this increase in size. With the exception of the reindeer, antlers are confined to the males.

III. The third type of horn is presented by the American prongbuck, or pronghorn, in which bony processes, or 'cores,' corresponding to the horns of the giraffe, have acquired a horny sheath, in place of skin; the sheath being in this instance forked, and annually shed and renewed, although the core is simple. The sheaths are akin to hair in structure, thus suggesting affinity with the hairs surmounting the giraffe's horns. Female prongbuck may or may not have horns.

IV. In the great majority of 'Hollow-horned Ruminants,' such as oxen, sheep, goats and antelopes (fig. 2), the horny sheath (or true 'horn') forms a simple unbranched cone, which may be compressed, spirally twisted, or curved in one or more directions, but is permanently retained and continues to grow throughout life from the base, while it becomes worn away at the tip. Rarely, as in the four-horned antelope, there are two pairs of horns. In many cases these horns are present in both sexes.

Dr. H. Gadow is of opinion that the antlers of the deer, the horn-like protuberances on the skull of the giraffe, and the true horns of the prongbuck and other hollow-horned ruminants (Bovidae) are all different stages of evolution from a single common type: the antlers of the deer being the most primitive, and the horns of the Bovidae the most specialized. From the fact that the bony horn-core of the hollow-horned ruminants first develops as a separate ossification, as do the horns of the giraffe, while the pedicle of the antlers of the deer grow direct from the frontal bone, it has been proposed to place the hollow-horned ruminants (inclusive of the prongbuck) and the giraffes in one group and the deer in another. This arrangement has the disadvantage of separating the deer from the giraffes, to which they are evidently nearly related; but Dr. Gadow's work brings them more into line. Whether he is right in regarding the hollow-horned ruminants as derived from the primitive deer may, however, be a matter of opinion. One very important fact recorded by Dr. Gadow is that calves and lambs shed their horns at an early age. The Bovidae are thus brought into nearer relationship with the American prongbuck (the only living ruminant which sheds its horns-covers in the adult condition) than has generally been supposed.

The above-mentioned four types of skull appendages are generally regarded as several characteristic of as many family groups, namely the Giraffidae, Cervidae, Antilocapridae and Bovidae. The two last are, however, much more closely connected than any of the others, and should perhaps be united.

Giraffidae.—In the Giraffidae, which include not only giraffes (Giraffa) but also the okapi (Ocapia) and a number of extinct species from the Lower Pliocene formations of southern Europe, Asia and North Africa, the appendages on the skull are of type No. I., and may well be designated 'antler-horns.' Another important feature is that the lower canine has a cleft or two-lobed crown, so that it is unlike the incisors to which it is approximated. There are no upper canines; and the cheek-teeth are short-crowned (brachyodont) with a peculiar grained enamel, resembling the skin of a slug in character. The feet have only two hoofs, all traces of the small lateral pair found in many other ruminants having disappeared.

The giraffes (Giraffa) are now an exclusively African genus, and have long legs and neck, and three horns—a single one in front and a pair behind—supplemented in some instances with a rudimentary pair on the occiput.

The okapi (Ocapia), which is also African but restricted to the tropical forest-region, in place of being an inhabitant of more or less open country, represents a second genus, characterized by the shorter neck and limbs, the totally different type of colouring, and the restriction of the horns to the male sex, in which they form a pair on the forehead; these horns being more compressed than...
Brematherium and Hyposkiptherium of India the horns of the males were complex, those of the former including an occipital pair, while those of the latter arise from a common base. In both genera, as in the okapi, there is a vacuity in front of the orbit. Largest of all is Saintatherium, typically from the Lower Pliocene of Northern India, but also recorded from Adrianople, in which the skull of the male is short and wide, with a pair of simple conical horns above the eye, and a large branching pair at the vertex. Tithonitherium is an allied form from North Africa. Whether the Giraffidae were originally an African or an Euro-Asianic there is not yet sufficient evidence to decide. The family is represented in the western hemisphere by the deer-tribe, or Cervidae, the lower canine, as in the two following families, is simple and similar to the incisors. The frontal appendages, when present, are confined (except in the case of the reindeer) to the males, and take the form of antlers, that is to say, they are of No. II. in the foregoing description. As a general rule, the molars, and more especially the first, are partially brachyodont (short-crowned); although they are taller in the chital (Cervus axis). In the skull there are two orifices to the lachrymal duct, situated on or inside the rim of the orbit. A preorbital cavity of such dimensions as to exclude the lachrymal bone from articulation with the nasal. Upper canines usually present in both sexes, and sometimes attaining a very great size in the male (see fig. 3).

Lateral digits of both fore and hind feet almost always present, and frequently the lower ends of the metacarpals and the metatarsals as well. Placenta with few cotyledons. Gall-bladder absent (except in the musk-deer, Moschus). This family contains numerous species, having a wide geographical distribution, ranging in the New World from the Arctic circle as far south as Patagonia, and in the Old World throughout the whole of Europe and Asia, and absent in Africa south of the Sahara, and, of course, Australia.

Evidently the family originated in the northern continent of the Old World, from which an entrance was effected by way of Bering Strait into America. Some of the more northern American deer, such as the wapiti, reindeer and elk (moose), are closely allied to the Old World species; but there is also a group of exclusively American deer (Mazama)—the only one found in Central and South America—and the members of which are unlike any living Old World deer; and these must be regarded as having reached the western hemisphere at an earlier date than the wapiti, reindeer and elk (see Deer, Elk, Fallow-Deer, Muntjac, Musk-Deer, Pere David's Deer, Reindeer, Roe Buck, Water-Deer, &c.).

Remains of deer more or less nearly allied to species inhabiting the same districts are found in the greater part of the present habitat of the family. It is noteworthy, however, that certain Pliocene European deer (Anogochois) appear to be closely allied to the modern American deer (Mazama). As we descend in the geological series, the species range from small to large, and from Miocene Dicerosurus; while in the Oligocene Amphitherium, Dremotherium and Palaeomeryx, constituting the family Palaeomerycidae, antlers were absent, and the crowns of the molars so low that the lower molars were preserved in a relatively complete state. Most of these animals were of small size, and many had long upper canines, like those of the existing Hydropus; while in all there was no depression for a gland in front of the eye.

From America, America has been obtained specimens of certain remains which seem in some degree intermediate between deer and the prongbuck. Of one of these a complete skeleton was obtained in 1901 from the Middle Miocene deposits of north-eastern Colorado, in such a position as to have been completely articulated with the skeleton of a wild pig. With the exception that the right antler is malformed and partially aborted, and that the bones of the lateral toes have been lost, the skeleton is practically complete. The one complete antler has a well-marked bend, and a large base, but only three tiny tines. After this there is a bifurcation of the hinder branch, thus producing three tines. From the presence of these well-marked antlers the skeleton would at first sight be set down as that of a small and primitive deer, conforming in regard to the structure of these appendages to the American type of the group. Mr. W. D. Matthew shows, however, that the skeleton of Merycicus, as the extinct ruminant is called, differs markedly from that of all deer. The most noteworthy point of distinction is in the skull, in which the facial portion is sharply bent down on the posterior basal axis (oxen, antelopes, &c.), and the American prongbuck, instead of running more or less nearly parallel to the same, as in deer. Again, the cheek-teeth have the tall crowns characteristic of a large number of the antelopes, with the single exception of the prongbuck, showing that Merycicus cannot be regarded as a primitive type. As regards the general structure of the rest of the skeleton, it must suffice to say that this agrees closely with that of the ante- lopes, the only exception being the character of the third vertebra.

As a whole Merycicus presents a curious mixture of cervine and antilope character. To explain these, two alternatives are offered by the describer. Either we must regard Merycicus as a deer which paralleled the antelopes and the prongbuck in every detail of skeletal structure, or, else, like the prongbuck, an antelope separated from the main stock at a date sufficiently early to have permitted the development of a distinct type of cranial appendages, namely, antlers in place of true horns. The former alternative, it is urged, involves a parallelism too close and too uniform between unrelated types to have been probable. On the latter view Merycicus, the prongbuck (Antilocapra) and the antelopes must be regarded as descending from an original stock from which the divergent types, deviating in the structure of their cranial appendages, but parallel in other respects. If, therefore, Antilocapra deserves to be separated as a family from the Bovidae, the same can scarcely be done for deer, in which we have to do with an apparent absence of signs of intimate relationship between antelopes, prongbuck, and deer, and it may be necessary eventually to amend the present classification. As a temporary measure it seems preferable to regard the family of Antilocapridae as a family in itself, the latter course being adopted by Mr. Matthew.

Whatever be the ultimate verdict, the association of antelopes and prongbuck, be it noted, existing almost exactly with Terry mother type characteristic of American deer—by tailed a type from the skull, and teeth in meromyx in is a most interesting and unexpected feature. Merycicus was named many years ago by Professor Leidy, and from the evidence of imperfect materials, and other facts, the name has been retained. It is well known that the type to which latter group the animal is structurally akin. In view of what has been stated in the preceding paragraph with regard to the extinct American genus Merycicus, it seems, however, at least probable that the prongbuck should be considered as representing a type of a family—Antilocapridae. The characteristic of this family—as represented by the prongbuck—is that the sheath of the horns is forked, and shed annually, or every few years. The cheek-teeth are tall-crowned (hypodont), and lateral horns are wanting (see PRONGBUCK).

Bovidae.—Lastly, we have the great family of hollow-horned ruminants or Bovidae, in which the horns (present in the males at least, and all the existing species) take the form of simple non-deciduous hollow sheaths growing upon bony cores. As a rule the molars are tall-crowned (hypodont). Usually only one orifice to the lachrymal canal, situated inside the rim of the orbit. Lachrymal bone is always reduced, as in the deer, and the palatines become part of the hard palate; no maxillary bones or antlers are present in both sexes. The lateral toes may be completely absent, but more often are represented by the hoofs alone, supported sometimes by a very rudimentary skeleton, consisting of mere irregular nodules of bone. The perianal grooves are always present, and the metatarsals never present. Gall-bladder almost always present. Placenta with many cotyledons.

The Bovidae form a most extensive family, with members widely distributed throughout the Old World, with the exception of the Australian region; but in America they are less numerous, and confined to the Arctic and northern temperate regions, no species being indigenous either to South or Central America. The home of the genus Bovus is most wide and varied, ranging in number of species from the Equator to the Arctic and Antarctic circles. Many of the forms made their way into North America by way of what is now Bering Strait. It has already been pointed out that the Cervidae originated in the northern continent of the Old World; and it is evident that the Bovidae did not follow in the same track. Unfortunately, we know at present practically nothing about the past history of the group, all the fossil species present discovered approximating more or less closely to existing types. We are admitting, therefore, that there are several facts in favour of the theory of an African origin of the Bovidae, final judgment
PECS—PEDIANT

must for the present be suspended. For the various generic types see R. L. *

PECS (Ger. Fünfkirchen), a town of Hungary, capital of the country of Baranya, 160 m. S.S.W. of Budapest by rail. Pop. (1900), 42,252. It lies on the outskirts of the Mosel hills and is composed of the inner old town, which is laid out in an almost regular square, and four suburbs. Pecs is the see of a Roman Catholic bishop, and its cathedral, reputed one of the oldest churches in Hungary, is also one of the finest medieval buildings in the country. It was built in the 11th century in the Romanesque style with four towers, and completely restored in 1881-1891. In the Cathedral Square is situated the Sacellum, a subterranean brick structure, probably a burial-chapel, dating from the end of the 4th or the beginning of the 5th century. Other noteworthy buildings are the parish church, formerly a mosque of the Turkish period; the hospital church, also a former mosque, with a minaret 88 ft. high, and another mosque, the bishop’s palace, and the town and county hall. Pecs has manufactories of woolens, porcelain, leather and paper, and carries on a considerable trade in tobacco, gall-nuts and wine. The hills around the town are covered with vineyards, which produce one of the best wines in Hungary. In the vicinity are valuable mineral springs which since 1858 are worked by the Danube Steamship Company.

According to tradition Pecs existed in the time of the Romans under the name of Sompsiana, and several remains of the Roman and early Christian period have been found here. In the Frankish-German period it was known under the name of Quinke ecclesiae; its bishopric was founded in 1009. King Ludwig I. founded here in 1367 a university, which existed until the battle of Mohacs. In 1543 it was taken by the Turks, who retained possession of it till 1686.

PECTORAL, a word applied to various objects worn on the breast (Lat. pectus); thus it is the name of the ornamental plate of metal or embroidery formerly worn by bishops of the Roman Church during the celebration of mass, the breastplate of the Jewish high priest, and the metal plate placed on the breast of the embalmed dead in Egyptian tombs. The “pectoral cross,” a small cross of precious metal, is worn by bishops and abbots of the Roman, and by bishops of the Russian, and other Eastern churches. The term has also been used for the more general “poitrel” or “peitrel” (the French and Norman French forms respectively), the piece of armour which protected the breast of the war-horse of the middle ages.

PECULIAR, a word now generally used in the sense of that which solely or exclusively belongs to, or is particularly characteristic of, an individual; hence strange, odd, queer. The Lat. peculiarius meant primarily “belonging to private property” and is formed from peculum, private property, particularly the property given by a puerfamilias to his children, or by a master to his slave, to enjoy as their own. As a term of ecclesiastical law “peculiar” is applied to those ecclesiastical districts, parishes, chapels or churches, once numerous in England, which were outside the jurisdiction of the bishop of the diocese in which they were situated, and were subject to a jurisdiction “peculiar” to themselves. They were introduced originally, in many cases by papal authority, in order to limit the powers of the bishop in his diocese. There were royal peculiaris, e.g. the Chapel Royal St James’s, or St George’s Windsor, peculiaris of the archbishop, over certain of which the Court of Peculiars exercised jurisdiction (see Arches, Court of), and peculiaris of bishops and deans (see Dean). The jurisdiction and privileges of the “peculiaris” were abolished by statutory powers given to the Ecclesiastical Commissioners, by the Ecclesiastical Commissioners’ Acts 1836 and 1850, by the PLuralities Act 1838, the Ecclesiastical Jurisdiction Act 1847, and other statutes.

PECULIAR PEOPLE, a small sect of Christian faith-healers founded in London in 1838 by John Banyard. They consider themselves bound by the literal interpretation of James v. 14, and in cases of sickness seek no medical aid but rely on oil, prayer and nursing. The community is in the main composed of simple working people, who, apart from their peculiarity, have a good reputation; but their avoidance of professional medical attention has led to severe criticism at inquests on children who have died for want of it.

PEDIANT, one who exaggerates the value of detailed erudition for its own sake; also a person who delights in a display of the exact niceties of learning, in an excessive obedience to theory without regard to practical uses. The word came into English in the latter part of the 17th century in the sense of schoolmaster, the original meaning of Ital. pedante, from which it is derived. The word is usually taken to be an adaptation of Gr. *pedelao,
to teach. Others connect with an O. Ital. pedare, to tramp about (Lat. pes, foot), or rather tramping about with his pupils.

PEDEN, ALEXANDER (c. 1626–1680), Scottish divine, one of the leading forces in the Covenant movement, was born at Auchinleoch, Ayrshire, about 1626, and was educated at Glasgow University. He was ordained minister of New Luce in Galloway in 1660, but had to leave his parish under Middleton's Ejection Act in 1663. For 23 years he wandered far and wide, bringing comfort and succour to his co-religionists, and often very narrowly escaping capture. He was indeed taken in June 1673 while holding a conventicle at Knockdow, and condemned by the privy council to 4 years and 3 months' imprisonment on the Bass Rock and a further 15 months in the Tolbooth at Edinburgh. In December 1678 he was, with sixty others, sentenced to banishment to the American plantations, but the party was liberated in London, and Peden made his way north again to divide the remaining years of his life between his own country and the north of Ireland. His last days were spent in a cave in the parish of Sorn, near his birthplace, and there he died in 1686, worn out by hardship and privation.

See A. Smelie, Men of the Covenant, ch. xxiv.

PEDERSEN, CHRISTIEN (c. 1480–1554), Danish writer, known as the father of Danish literature, was canon of the cathedral of Lund, and in 1510 went to Paris, where he took his master's degree in 1515. In Paris he edited the proverbs of Peder Laale and (1514) the Historia danica of Saxo Grammaticus. He showed signs of the spirit of reform, asserting that the gospels should be translated into the vernacular so that the common people might understand. He worked at a continuation of the history of Saxo Grammaticus, and became secretary to Christian II., whom he followed into exile in 1525. In Holland he translated the New Testament (1529) and the Psalms (1531) from the Vulgate, and, becoming a convert to the reformed opinion, he issued several Lutheran tracts. After his return to Denmark in 1532 he set up a printing press at Malmö. He published a Danish version (Kronike om Holger Danske) of the French romance of Ogier the Dane, and another of the Charlemagne legends, which is probably derived immediately from the Norwegian Karlamagnus saga. His greatest work, the Danish version of the Holy Scriptures, which is known generally as "Christian III.'s Bible," is an important landmark in Danish literature. It was founded on Luther's version, and was used by Peder Palladius, bishop of Zealand, and others.

PEDESTAL (Fr. piedestal, Ital. piedestallo, foot of a stall), a term generally applied to a support, square, octagonal or circular on plan, provided to carry a statue or a vase. Although in Syria, Asia Minor and Tunisia the Romans occasionally raised the columns of their temples or propylaeum on square pedestals, in Rome itself they were employed only to give greater importance to isolated columns, such as those of Trajan and Antoninus, or as a podium to the columns decorated actively in the Roman triumphal arches. The architects of the Italian revival, however, conceived the idea that no order was complete without a pedestal, and as the orders were by them employed to divide up and decorate a building in several storeys, the cornice of the pedestal was carried through and formed the sills of their windows, or, in open arcades, round a court, the balustrade of the arcade. They also would seem to have considered that the height of the pedestal should correspond in its proportion with that of the column of pilaster it supported; thus in the church of St John Lateran, where the applied order is of considerable dimensions, the pedestal is 13 ft. high instead of the ordinary height of 3 to 5 ft.

PEDICULOSIS, or PITIERRIASIS, the medical term for the pathological symptoms in man due to the presence of lice (pediculus), either on the head (pediculus capitis), body (pediculus corporis, or vestimentorum), or pubes (pediculus pubis).

PEDIGREE, a genealogical tree, a tabular statement of descent (see Genealogy). The word first appears at the beginning of the 13th century and takes an extraordinary variety of forms, e.g. pedicree, pe de gre, pietigreus, petigru, &c. It is generally accepted that these point to a corruption of Fr. pied de grue, foot of a crane, and that the probable reference is to the narks resembling the claw of a bird found in old genealogies showing the lines of descent. Such etymologies as Minshew's "par degrés, by degrees, or père degrés, descent by the father, are mere guesses.

PEDIMENT (equivalents, Gr. áerós, Lat. fastigium, Fr. ponton), in classic architecture the triangular-shaped portion of the wall above the cornice which formed the termination of the roof behind it. The projecting mouldings of the cornice which surround it enclose the tympanum, which is sometimes decorated with sculpture. The pediment in classic architecture corresponds to the gable in Gothic architecture, where the roof is of loftier pitch. It was employed by the Greeks only as the front of the roof which covered the main building; the Romans, however, adopted it as a decorative termination to a doorway, niche or window, and occasionally, in a row of windows or niches, alternated the triangular with a segmental pediment. It was reserved for the Italian architects of the decadence to break the pediment in the centre, thus destroying its original purpose. The earliest English form of the word is perimant or pepermest, probably a workman's corruption of "pyramid."

PEDIPALPI, Arachnida (g.v.) related to the spiders, and serving in a measure to bridge over the structural interval between the latter and the scorpions. The appendages of the third pair, representing the first pair of walking legs in spiders and scorpions, are, on the contrary, long, attenuated and many-jointed at the end. Like the antennae of insects, they act as feelers. It is from this structural feature that the term "pedipalpi" has been derived. In the tailless division of the Pedipalpi,

Mexican tailed Pedipalp (Mastigoproctus giganteus).
are large or medium-sized Arachnida, nocturnal in habits and spending the day under stones, logs of wood or loosened bark. Some species of the Uropygi (Thelyphonidae) dig burrows; and in the east there is a family of Amblypygi, the Charontidae, of which many of the species live in the recesses of deep caves. Specimens of another species have been found under stones between tide marks in the Andaman Islands. The Pedipalpi feed upon insects, and like spiders, are oviparous. The eggs after being laid are carried about by the mother, adhering in a glutinous mass to the underside of the abdomen.

Pedipalpi date back to the Carboniferous Period, occurring in deposits of that age both in Europe and North America. Moreover, the two main divisions of the order, which were as sharply differentiated then as they are now, have existed practically unchanged from that remote epoch.

In spite of the untold ages they have been in existence, the Pedipalpi are more restricted in range than the scorpions. The Uropygi are found only in Central and South America, and in south and eastern Asia, from India and south China to the Solomon Islands. The absence of the entire order from Africa is an interesting fact. The distribution of the Amblypygi practically covers that of the Uropygi, but in addition they extend from India through Arabia into tropical and southern Africa. Both groups are unknown in Madagascar, in Australia, with the exception possibly of the extreme north, and in New Zealand. Very little can be said with certainty about the distribution of the Tartar-ides. They have been recorded from the Indian Region, West Africa and sub-tropical America.

PEDOMETER (Lat. pes, foot, and Gr. μέτρον, measure), an apparatus in the form of a watch, which, carried on the person of a walker, counts the number of paces he makes, and thus indicates approximately the distance travelled. The ordinary form has a dial-plate marked for yards and miles. The registration is effected by the fall of a heavy pendulum, causing tick to each step. The pendulum is forced back to a horizontal position by a delicate spring, and with each stroke a fine-toothed ratchet-wheel connected with it is moved round a certain length. The ratchet communicates with a train of wheels which work the dial-hands. In using the apparatus a measured mile or other known distance is walked and the indication thereby made on the dial-plate observed. According as it is too great or too small, the stroke of the pendulum is shortened or lengthened by a screw. Obviously the pedometer is little better than an ingenious toy, depending even for rough measurements on the uniformity of pace maintained throughout the journey measured.

PEDRO II. (1825-1861), emperor of Brazil, came to the throne in childhood, having been born on the 2nd of December 1825, and proclaimed emperor in April 1831, upon the abdication of his father. He was declared of full age in 1840. For a long period few thrones appeared more secure, and in the prosperous and beneficent rule might have endured throughout his life but for his want of energy and attention to the signs of the times. The rising generation had become honeycombed with republicanism, the prospects of the imperial succession were justly regarded as unsatisfactory, the higher classes had been estranged by the emancipation of the slaves, and all these causes of discontent found expression in a military revolt, which in November 1889 overthrew the seemingly solid edifice of the Brazilian Empire in a few hours. Dom Pedro retired to Europe, and died in Paris on the 5th of December 1891. The chief events of his reign had been the emancipation of the slaves, and the war with Paraguay in 1864-70. Dom Pedro was a model constitutional sovereign, and a munificent patron of science and letters. He travelled in the United States (1876), and afterwards visited Europe (1871-1872, 1875-1877; 1886-1889).

PEEBLES, a royal and police burgh and county town of Peeblesshire, Scotland, situated at the junction of Eddleston Water with the Tweed. Pop. (1901), 5266. It is 27 m. south of Edinburgh by the North British Railway (22 m. by road), and is also the terminus of a branch line of the Caledonian system from Carstairs in Lanarkshire. The burgh consists of the new town, the principal quarter, on the south of the Eddleston, and the old on the north; the Tweed is crossed by a handsome five-arched bridge. Peebles is a noted haunt of anglers, and the Royal Company of Archers shoot here periodically for the silver arrow given by the burgh. The chief public buildings are the town and county halls, the corn exchange, the hospital and Chambers Institution. The last was once the town house of the earls of March, but was presented to Peebles by William Chambers, the publisher, in 1859. The site of the castle, which stood till the beginning of the 18th century, is now occupied by the parish church, built in 1887. Of St Andrew's Church, nothing is left but the tower, restored by William Chambers, who was buried beside it in 1883. The church of the Holy Rood was erected by Alexander III. in 1261, to contain a supposed remnant of the true cross discovered here. The building remained till 1784, when it was nearly demolished to provide stones for a new parish church. Portions of the town wall, called the Earl's Wall, and the several towers constructed in the 16th and 17th centuries as hiding-places against Border freebooters. The old cross, which had stood for several years in the quadrangle of Chambers Institution, was restored and erected in High Street in 1895. The industries consist of the manufactures of woollens and tweeds, and of meal and flour mills. The town is also an important agricultural centre.

The name of Peebles is said to be derived from the pebills, or tents, which the Gadeni pitched here in the days of the Romans. The place was early a favourite residence of the Scots kings when they came to hunt in Ettrick forest. It probably received its charter from Alexander III., was created a royal burgh in 1307 and was the scene of the poem of Pellar to the Play, ascribed to James I. In 1544 the town sustained heavy damage in the expedition led by the 1st earl of Hertford, afterwards the protector Somerset, and in 1604 a large portion of it was destroyed by fire. In 1801 and 1814 extended its charter, Peebles lost its importance after the union of the Crowns.

On the north bank of the Tweed. one mile west of Peebles, stands Neidpath Castle. The ancient peel tower dates probably from the 13th century. Its first owners were Tweeddale Frasers or Frisels, from whom it passed, by marriage, to the Hays of Yester in Haddingtonshire, earls of Tweeddale. It was besieged and taken by Cromwell in 1650. The third earl of Tweeddale (1645-1712) sold it to the duke of Queensberry in 1686. The earl of Wemys successed to the Neidpath property in 1810.

PEEBLESHIRE, or TWEEDDALE, a southern inland county of Scotland, bounded N. and N.E. by Edinburghshire, E. and S.E. by Selkirkshire, S. by Dumfriesshire, and W. by Lanarkshire. Its area is 222,509 acres or 547-8 sq. m. The surface consists of a succession of hills, which are highest in the south, broken by the vale of the Tweed and the glens formed by its numerous tributaries. South of the Tweed the highest points are Broad Law and Cramalt Craig on the confines of Selkirkshire (each 2733 ft.), while north of the river are the Inlaid Castle, Carrimon, New Preston, and New Preston Heights (1872), Trahennan Hill (1792), Pevenalla (1764) and Ladyhill (1774), and in the north-west the Pentland eminences of Mount Maw (1753), Byrehope Mount (1752) and King Seat (1521). The lowest point above sea-level is on the banks of the Tweed, where it passes into Selkirkshire (about 450 ft.). The principal river is the Tweed, and from the fact that for the first 36 m. of its course of 97 m. it flows through the south of the shire, the county derives its alternative name of Tweeddale. Its affluents on the right are the Stanhope, Drummelzier, Manor and Quair; on the left, the Biggar, Lyne, Eddleston and Leithen. The North Esk, rising in Cairnmuir, forms the boundary line between Midlothian and Peeblesshire for about four miles, during which it presents some very charming pictures, especially at Habbie's Howe, where Allan Ramsay laid the scene of the Globe Shepherd. For 4 m. of its course the South Medwin provides the south-western part of the parish from Lanarkshire. Portmore Loch, a small sheet of water 2 m. north of Eddleston church, lies at a height of 1000 ft. above the sea, and is the only lake in the county. The shire is in favour with anglers, its streams being wellstocked and unpolluted, and few restrictions being placed on the fishing.
Geology.—The southern elevated portion of the county is occupied by Silurian rocks, mainly by shales and grits or greywackes of Llandovery age. Owing to the repeated folding and crumpling of the rocks in this region there are numerous elliptical exposures of Ordovician strata within the Silurian; but the principal area of Ordovician rocks lies north of a line running south-west from the Moorfoot Hills through Lyne and Stobo. Here these rocks form a belt some four to five miles in breadth; they are composed of graywackes and grits, with unusual conformable temporary volcanic rocks of Arenig age, and of shales, grits and limestones of Llandoel and Caradoc age. The general direction of strike of all these formations is south-west-north-east, but the dips of the individual strata fluctuating through occasional inversion of the strata. Patches of higher Silurian, with Wenlock and Ludlow fossils, are found in the north of the county in the Pentland Hills, and resting conformably up the Silurian in the same district is the Lower Old Red Sandstone. The Old Red Sandstone here consists of lower division, red and chocolate marls and sandstones; a middle division, volcanic rocks, porphyries, tuffs, &c., which are unconformable on the lower marls in this area; and an upper division, sandstones and conglomerates. The south-west extremity of the Edinburgh coalfield just enters the county to the north-west border where a slice of Carboniferous strata is found let down from Silurian and Old Red rocks by two important faults. Both Calcareous sandstone and Carboniferous limestone occur, with greywackes and shales. The coal measures form a shale. An outlier of Carboniferous limestone, surrounded by Lower Old Red Sandstone, lies south of Linton. Much glacial boulder clay with gravel and sand rests upon the higher ground, while below it are the valley alluvia.

Climate and Industries.—The annual rainfall averages from 33 to 41 in.; the mean temperature for the year is 47° F., for January 38° F., and for July 50° F. The character of the soil varies considerably, peat, gravel and clay being all represented. The low-lying lands consist generally of rich loam, composed of sand and clay. The farming is pastoral rather than arable. The average holding is about 200 acres of arable land, with pasturage for from 600 to 800 sheep. Roughly speaking, one-fifth of the total area is under cultivation. Oats are the chief grain and turnips the chief root crop. The hill pastures are better suited to sheep than to cattle, but both flocks and herds are comparatively large. Cheviots and half-breds are preferred for the grass lands, the heathery ranges being stocked with black-faced sheep. Crosses of Cheviots, black-faced and half-bred ewes with Leicestershire rams are common. The favourite breed of cattle is a cross between Ayrshires and shorthorns, the cows being Ayrshire. Many of the horses are Clydesdale breeds in the county. Pig-keeping is on the decline. A few acres have been laid down as nurseries and market gardens, and about 10,000 acres are under wood, especially at Dalwicke, where larch and horse-chestnut were first grown in Scotland. Apart from agriculture, the only industries are the woolen factories and flour mills at Peebles and Innerleithen.

The North British railway crosses the county in the north from Leadburn to Dohalpont, and runs down the Eddleston valley from Leadburn to Peebles and Thornmiele, while in the south the Caledonian railway connects the county town with Biggar in Lanarkshire.

Population and Administration.—In 1901 the population numbered 15,666 or 43 persons to the sq. m. In 1901 one person spoke Gaelic only, 72 Gaelic and English. The chief towns are Peebles (pop. 5366) and Innerleithen (2181). West Linton, on the other hand, is a holiday resort. The shire combines with Selkirkshire to form the burgh of Peebles, and the electoral union of Peebles town voting with the county. Peeblesshire forms a sheriffdom with the Lothians and a sheriff-substitute sits in the county town. There is a high school in Peebles, and one or more schools in the county usually earn grants for secondary education.

History.—The country was originally occupied by the Gadens, a British tribe, of whom there are many remains in the shape of camps and sepulchral mounds (in which stone coffins, axes and hammers have been found), while several place-names (such as Peebles, Dalwicke and Stobo) also attest their presence. The standing stones near the confluence of the Lyne and Tweed are supposed to commemorate a Cymric chief. The natives were reduced by the Romans, who have left traces of their military rule in the fine camp at Lyne, locally known as Randal's Walls. The hill-side terraces at Romanno are conjectured, somewhat fancifully, to be remains of a Roman method of cultivation. On the site of the Romano temple, within the territory of the same, and although they are said to have been deserted by King Arthur at Cademuir in 539, they held the district until the consolidation of the kingdom after Malcolm II's victory at Carham in 1018, before which the land, constantly harried by Danes, was nominally included in the territory of Northumbria. This tract of Scotland is closely associated with the legend of Merlin. David I. made the district a deanery in the archdeaconry of Peebles, and it afterwards formed part of the diocese of Glasgow. Towards the middle of the 12th century it was placed under the jurisdiction of two sheriffs, one of whom was settled at Traquair and the other at Peebles. At Happry, in the valley of the Lyne, the English defeated Wallace in 1304. The Scottish sovereigns had a lodge at Polmood, and often hunted in the uplands and the adjoining forests. English armies occasionally invaded the county, but more frequently the people were harried by Border raiders. Many castles and peels were erected in the valley of the Tweed from the Bield to Berwick. Several were renowned in their day, among them Oliver Castle (built by Sir John de Drummond), Drumelzier, Tinnis or Thane's Castle, and Neidpath. Two series of local grants stand the ruins of Drochil Castle, designed for the Regent Morton, who was beheaded at Edinburgh in 1581, and the building was never completed. Memories of the Covenanters cluster around Tweedhopefoot, Tweedshaws, Corehead, Tweedsmuir, Talla Linns and other spots. In the churchyard of Tweedsmuir is the tombstone of John Hunter, the martyr, which was relettered by "Old Mortality." The "men of the moss hags" did little fighting in Peeblesshire, but Montrose first drew rein at Traquair House after he was defeated at Philiphaugh on the Yarrow in 1645. The plain of Sherriffmuir near Lyne is the place where the Tweeddale wanspins used to be held in the 17th century. The Jacobite risings left the county untouched, and since the beginning of the 19th century the shire has been more conspicuous in literature than in politics.

PEEL, SIR ROBERT

contested Coventry in 1863; in 1865 he was elected in the liberal interest for Warwick, for which he sat until his elevation to the peerage. In December 1868 he was appointed parliamentary secretary to the poor law board. This office he filled until 1871, when he became secretary to the board of trade, an appointment which he held for two years. In 1873–1874 he was patronage secretary to the treasury, and in 1880 he became under-secretary for the home department. On the retirement of Mr Brand (afterwards Viscount Hampden) in 1884, Peel was elected Speaker. He was thrice re-elected to the post, twice in 1886, and again in 1892. Throughout his career as Speaker he exhibited conspicuous impartiality, combined with a perfect knowledge of the traditions, usages and forms of the house, soundness of judgment, and readiness of decision upon all occasions; and he will always rank as one of the greatest holders of this important office. On the 8th of April 1895 he announced that for reasons of health he was compelled to retire. The farewell ceremony was of a most impressive character, and warm tributes were paid from all parts of the house. He was created a viscount and granted a pension of £4000 for life. He was presented with the freedom of the City of London in July 1895. The public interest shows his father’s son’s eminent service, and he has that controversial connexion with the drink traffic. A royal commission was appointed in April 1896 to inquire into the operation and administration of the licensing laws, and Viscount Peel was appointed chairman. In July 1898 Lord Peel drew up a draft report for discussion, in five parts. Some differences of opinion arose in connexion with the report, and at a meeting of the commissioners on the 12th of April 1899, when part 5 of the draft report was to be considered, a proposal was made to substitute an alternative draft for Lord Peel’s, and also a series of alternative drafts for the four sections already discussed. Lord Peel declined to put these proposals, and left the room. Sir Algernon West was elected to the chair, and ultimately two main reports were presented, one section agreeing with Lord Peel, and the other—including the majority of the commissioners—presenting a report which differed from his in several important respects. The Peel report recommended that a large reduction in the number of licensed houses should be immediately effected, and that no compensation should be paid from the public rates or taxes, the money for this purpose being raised by an annual licence-rental levied on the rateable value of the licensed premises; it at once became a valuable weapon in the hands of advanced reformers.

Lord Peel married in 1862, and had four sons and two daughters (married to Mr J. Rochfort Maguire and to Mr C. S. Goldman). His eldest son, William Robert Wellesley Peel (b. 1866), married the daughter of Lord Ashton; he was Unionist M.P. for South Manchester from 1900 to 1905, and later for Taunton, and also acted as Municipal Reform leader on the London County Council.

PEEL, SIR ROBERT, BART. (1788–1850), English statesman, was born on the 5th of February 1788 at Chamber Hall, in the neighbourhood of Bury, Lancashire, or, less probably, at a cottage near the Hall. He was a scion of that new aristocracy of wealth which sprang from the rapid progress of mechanical discovery and manufactures in the latter part of the 18th century. His ancestors were Yorkshire yeomen in the district of Craven, whence they migrated to Blackburn in Lancashire. His grandfather, Robert Peel, first of Peelhold, and afterwards of Brookside, near Blackburn, was a calico-prINTER, who, appreciating the discovery of his townsman Hargreaves, took to cotton-spinning with the spinning-jenny and grew a wealthy man. His father, Robert Peel (1750–1830), third son of the last-named, carried on the same business at Bury with still greater success, in partnership with his uncle, Mr Haworth, and Mr Yates, whose daughter, Ellen, he married. He made a princely fortune, became the owner of Drayton Manor and member of parliament for the neighbouring borough of Tamworth, was a trusted and honoured, as well as ardent, supporter of Pitt, contributed munificently towards the support of that leader’s war policy, and was rewarded with a baronetcy (1800).

At Harrow, according to the accounts of his contemporaries, Peel was a steady industrious boy, the best scholar in the school, fonder of country walks with a friend than of school games, but reputed one of the best football players. At Christ Church, where he entered as a gentleman commoner, he was the first who, under the new examination statutes, took a first class both in classics and in mathematics. His examination for his B.A. degree in 1808 was an academical ovation in presence of a numerous audience, who came to hear the first man of the day. From his classical studies Robert Peel derived not only the classical, though somewhat pompous, character of his speeches and the Latin quotations with which they were often happily interspersed but something of his lofty ideal of political ambition. To his mathematical training, which was then not common among public men, he no doubt owed in part his method, his clearness, his great power of grasping steadily and working out difficult and complicated questions. His speeches show that, in addition to his academical knowledge, he was well versed in English literature, in history, and in the principles of law, in order to study which he entered at Lincoln’s Inn. But while reading hard he contrived to develop his tall and vigorous frame, and, though he lost his life partly through his bad riding, he was always a good shot and an untiring walker after game. His Oxford education confirmed his attachment to the Church of England. His practical mind remained satisfied with the doctrines of his youth, and he never showed that he had studied the great religious controversies of his day.

In 1809, being then in his twenty-second year, he was brought into parliament for the close borough of Cashel, which he afterwards exchanged for Chippenham, and commenced his parliamentary career under the eye of his father, then member for Tamworth, who fondly saw in him the future leader of the Tory party. In that House of Commons sat Wilberforce, Windham, Tierney, Grattan, Perceval, Castlereagh, Plunkett, Romilly, Mackintosh, Burdett, Whitbread, Horner, Brougham, Parnell, Huskisson, and, above all, George Canning. Lord Palmerston entered the house two years earlier, and Lord John Russell three years later. Among these men young Peel had to rise. And the rose not by splendid eloquence, by profound political philosophy or by great originality of thought, but by the closest attention to all his parliamentary duties, by a study of all the business of parliament, and by a style of speaking which owed its force not to high flights of oratory, but to knowledge of the subject in hand, clearness of exposition, close reasoning, and tact in dealing with a parliamentary audience. With the close of the struggle against revolutionary France, political progress in England was soon to resume the march which that struggle had arrested. Young Peel’s lot, however, was cast, through his father, with the Tory party. In his maiden speech in 1810, seconding the address, he defended the Walcheren expedition, which he again vindicated soon afterwards against the report of Lord Porchester’s committee. It is said that even then his father had discerned in him a tendency to think for himself, and told Lord Liverpool that to make sure of his support it would be well to place him early in harness. At all events he began official life in 1810 as Lord Liverpool’s under-secretary for war and the colonies under the administration of Perceval. In 1812 he was transferred by Lord Liverpool to the more important but unhappy post of secretary for Ireland. There he was engaged till 1818 in maintaining English ascendancy over a country heaving with discontent, teeming with conspiracy, and ever ready to burst into rebellion. A middle course between Irish parties was impossible, and Peel plied the established engines of coercion and patronage with a vigorous hand. At the same time, it was his frequent duty to combat Grattan, Plunkett, Canning and the other movers and advocates of Roman Catholic emancipation in the House of Commons. He, however, always spoke on this question with a command of temper wonderful in hot youth, with the utmost courtesy towards his opponents, and with warm expressions of sympathy and even of admiration for the Irish people. He also, thus early, did his best to advocate and promote joint education in Ireland as a means of reconciling
s and raising the character of the people. But his greatest service to Ireland as secretary was the institution of the regular Irish constabulary, nicknamed after him "Peelers," for the protection of life and property in a country where both were insecure. His moderation of tone did not save him from the violent abuse of O'Connell, whom he was ill advised enough to challenge—an affair which covered them both with ridicule.

In 1817 he obtained the highest parliamentary distinction of the Tory party by being elected member for the university of Oxford—an honour for which he was chosen in preference to Canning on account of his hostility to Roman Catholic emancipation, Lord Eldon lending him his best support. In the following year he resigned the Irish secretariaship, of which he had long been very weary, and remained out of office till 1821. But he still supported the ministers, though in the affair of Queen Caroline he stood aloof, disapproving some steps taken by the government, and sensitive to popular opinion; and when Canning retired on account of this affair Peel declined Lord Liverpool's invitation to take the vacant place in the cabinet. During this break in his tenure of office he had some time for reflection, which there was enough in the aspect of the political world to move. But early office had done its work. It had given him excellent habits of business, great knowledge and a high position; but it had left him somewhat stiff and punctilious, too cold and reserved and over anxious for formal justifications when he might well have left his conduct to the judgment of men of honour and the heart of the people. At the same time he was no pedant in business; in corresponding on political subjects he loved to throw off official forms and communicate his views with the freedom of private correspondence; and where his confidence was given, it was given without reserve.

At this period he was made chairman of the bullion committee on the death of Horner. He was chosen for this important office by Huskisson, Ricardo and their fellow-economists, who saw in him a mind open to conviction, though he owed hereditary allegiance to Pitt's financial policy, and had actually voted with his Pittite father for a resolution of Lord Liverpool's government asserting that Bank of England notes were equivalent to legal coin. The choice proved judicious. Peel was converted to the currency doctrines of the economists, and proclaimed his conversion in a great speech on the 24th of May 1819, in which he moved and carried four resolutions embodying the recommendations of the bullion committee in favour of a return to cash payments. This laid the foundation of his financial reputation, and his co-operation with the economists tended to give a liberal turn to his commercial principles. In the course he took he somewhat diverged from his party, and particularly from his father, who remained faithful to Pitt's depreciated paper, and between whom and his schismatic son a solemn and touching passage occurred in the debate. The author of the Cash Payments Act had often to defend his policy, and he did so with vigour. The act is sometimes said to have been hard on debtors, including them in the debtors' relief, but it required debts to be paid in cash which had been contracted by a bankrupt, and Peel, as heir to a great fundholder, was even charged with being biased by his personal interests. But it is answered that the Bank Restriction Acts, under which the depreciated paper had circulated, themselves contained a provision for a return to cash payments six months after peace.

In 1820 Peel married Julia, daughter of General Sir John Floyd, who bore him five sons and two daughters. The writers who have most severely censured Sir Robert Peel as a public man have dwelt on the virtues and happiness of his private and domestic life. He was not only a most loving husband and father but a true and warm-hearted friend. In Whitehall Gardens or at Drayton Manor he gathered some of the most distinguished intellects of the day. He indulged in free and cheerful talk, and sought the conversation of men of science; he took delight in art, and was a great collector of pictures; he was fond of farming and agricultural improvements; he actively promoted useful works and the advancement of knowledge; he loved making his friends, dependants, tenants and neighbours happy. And, cold as he was in public, few men could be more bright and genial in private than Sir Robert Peel.

In 1821 Peel consented to strengthen the enfeebled ministry of Lord Liverpool by becoming home secretary; and in that capacity he had again to undertake the office of coercing the growing discontent in Ireland, of which he remained the real administrator, and had again to lead in the House of Commons the opposition to the rising cause of Roman Catholic emancipation. In 1825, being defeated on the Roman Catholic question in the House of Commons, he wished to resign office, but Lord Liverpool pleaded that his resignation would break up the government. He found a congenial task in reforming and humanizing the criminal law, especially those parts of it which related to offences against property and offences punishable by death. The five acts in which Peel accomplished this great work, as well as the great speech of the 9th of March 1826, in which he opened the subject to the house, will form one of the most solid and enduring monuments of his fame. Criminal law reform was the reform of Romilly and Mackintosh, from the hands of the latter of whom Peel received it. But the masterly bills in which it was embodied were the bills of Peel—not himself a creative genius, but, like the founder of his house, a profound appreciator of other men's creations, and unrivalled in the power of giving them practical and complete effect.

In 1827 the Liverpool ministry was broken up by the fatal illness of its chief, and under the new premier, George Canning, Peel, like the duke of Wellington and other high Tory members of Lord Liverpool's cabinet, refused to serve. Canning and Peel were rivals; but we need not interpret as mere personal rivalry that which was certainly, in part at least, a real difference of connexion and opinion. Canning took a Liberal line, and was supported by many of the Whigs; the seceders were Tories, and it is difficult to see how their position in Canning's cabinet could have been otherwise than a false one. Separation led to public coolness and occasional approaches to bitterness on both sides in debate. But there seems no ground for exaggerated complaints against Peel's conduct. Canning himself said to a friend that "Peel was the only man who had behaved decently towards him." Their private intercourse remained uninterrupted to the end; and Canning's son afterwards entered public life under the auspices of Peel. The charge of having urged Roman Catholic emancipation on Lord Liverpool in 1825, and opposed Canning for being a friend to it in 1827, made against Sir Robert Peel in the fierce corn-law debates of 1846, has been withdrawn by those who made it.

In January 1828, after Canning's death, the duke of Wellington formed a Tory government, in which Peel was home secretary and leader of the House of Commons. This cabinet, Tory as it was, did not include the impracticable Lord Eldon, and did include Huskisson and three more friends of Canning. Its policy was to endeavour to stave off the growing demand for organic change by administrative reform, and by lightening the burdens of the people. The civil list was retrenched with an irreversible hand, the public expenditure was reduced lower than it had been since the Revolutionary war, and the import of corn was permitted under a sliding scale of duties. Peel also introduced into London the improved system of police which he had previously established with so much success in Ireland. But the tide ran too strong to be thus headed. First the government were compelled, after a defeat in the House of Commons, to acquiesce in the repeal of the Test and Corporation Acts, Peel bringing over their High Church supporters, as far as he could. Immediately afterwards the question of Roman Catholic emancipation was brought to a crisis by the election of O'Connell for the county of Clare. In August Peel expressed to the duke of Wellington his conviction that the question must be settled. He wrote that out of office he would co-operate in the settlement but in his judgment it should be committed to other hands than his. To this the duke assented, but in January 1829, owing to the declared opinions of the king, of the House of Lords, and of the Church against a change of policy, Wellington came to the
conclusion that without Peel’s aid in office there was no prospect of success. Under that pressure Peel consented to remain, and all the cabinet approved. The consent of the king, which could scarcely have been obtained except by the duke and Peel, was extorted, withdrawn (the ministers being out for a few hours), and again extorted; and on the 5th of March 1839 Peel proposed Roman Catholic emancipation in a speech of more than four hours. The apostate was overwhelmed with obloquy. Having been elected for the university of Oxford as a leading opponent of the Roman Catholics, he had thought it right to resign his seat on being converted to emancipation. His friends put him again in nomination, but he was defeated by Sir R. H. Inglis. He took refuge in the close borough of Westminster, whence he afterwards removed to Tamworth, for which he sat till his death.

Catholic emancipation was forced on Peel by circumstances; but it was mainly owing to him that the measure was complete, and based upon equality of civil rights. This great concession, however, did not save the Tory government. The French Revolution of July 1830 gave fresh strength to the movement against them, though, schooled by the past, they promptly recognized King Louis Philippe. The parliamentary reform movement was joined by some of their offended Protestant supporters. The duke of Wellington provided them fatally for the attack. He relaxed the restrictions against them on the demise of the Crown; they were beaten on Sir H. Parnell’s motion for a committee on the civil list, and Wellington took the opportunity to resign rather than deal with reform.

While in office, Peel succeeded to the baronetcy, Drayton Manor and a great estate by the death of his father (May 3, 1830). The old man had lived to see his fondest hopes fulfilled in the greatness of his son; but he had also lived to see that a father must not expect to fix his son’s opinions—above all, the opinions of such a son as Sir Robert Peel, and in such an age as that which followed the French Revolution.

Sir Robert Peel’s resistance to the Reforms Bill won back for him the allegiance of his party. His opposition was resolute but it was temperate, and once only he betrayed the suppressed fire of his temper, in the historical debate on the 22nd of April 1831, when his speech was broken off by the arrival of the king to dissolve the parliament which had thrown out reform. He refused to join the duke of Wellington in the desperate enterprise of forming a Tory government at the height of the storm, when the news of the eminently popular and popularly named Reform Parliament was an unlimited creation of peers. By this conduct he secured for his party the full benefit of the reaction which he no doubt knew was sure to ensue. The general election of 1832, after the passing of the Reform Bill, left him with barely 150 followers in the House of Commons; but this handful rapidly swelled under his management into the great Conservative party. He frankly accepted the Reform Act as irrevocable, taught his party to register instead of despairing, appealed to the intelligence of the middle classes, whose new-born power he appreciated, steadily supported the Whig ministers against the Radicals and O’Connell, and gained every moral advantage which the most dignified and constitutional tactics could afford. To this policy, and to the great parliamentary powers of its author, it was mainly due that, in the course of a few years, the Conservatives were as strong in the reformed parliament as the Tories had been in the unreformed. It is vain to deny the praise of genius to such a leader, though the skill of a pilot who steered for many years over such waters may sometimes have resembled craft. But the duke of Wellington emphatically said of him, “Of all the men I ever knew, he had the greatest regard for truth.” The duke might have added that his own question, “How is the king’s government to be carried on in a reformed parliament?” was mainly solved by the temperate and constitutional policy of Sir Robert Peel, and by his personal influence on the debates and proceedings of the House of Commons during the years which followed the Reform Act.

In 1834, on the dismissal of the Melbourne ministry, power came to Sir Robert Peel before he expected or desired it. He hurried from Rome at the call of the duke of Wellington, whose sagacious modesty yielded him the first place, and became prime minister, holding the two offices of first lord of the treasury and chancellor of the exchequer. He vainly sought to include in his cabinet two recent adherents from the Whigs, Lord Stanley and Sir James Graham. A dissolution gave him a great increase of strength in the house, but not enough. He was outvoted on the question of the speaker at the opening of the session of 1835, and, after struggling on for six weeks longer, resigned on the question of appropriating part of the revenues of the Church in Ireland to national education. His time had not yet come; but the capacity, energy and resource he displayed in this short tenure of office raised him immensely in the estimation of the house, his party and the country. Of the great budget of practical reforms which he brought forward, the plan for the commutation of tithes, the ecclesiastical commission, and the plan for settling the question of dissenters’ marriages bore fruit.

From 1835 to 1840 he pursued the same course of patient and far-sighted opposition. In 1837 the Conservative members of the House of Commons gave their leader a grand banquet at Merchant Taylors’ Hall, where he proclaimed in a great speech the creed and objects of his party. In 1839, the Whigs having resigned on the Jamaica Bill, he was called on to form a government, and submitted names for a cabinet, but resigned the constitution to the young queen’s persistent refusal to part with any Whig ladies of her bedchamber (see VICTORIA, QUEEN). In 1840 he was hurried into a premature motion of want of confidence. But in the following year a similar motion was carried by a majority of one, and the Whigs ventured to appeal to the country. The result was a majority of ninety-one against them on a motion of want of confidence in the autumn of 1841, upon which they resigned, and Sir Robert Peel became first lord of the treasury, with a commanding majority in both Houses of Parliament.

The crisis called for a master-hand. The finances were in disorder. For some years there had been a growing deficit, estimated for 1842 at more than two millions, and attempts to supply this by additions to assessed taxes and customs duties had failed. The great financier took till the spring of 1842 to mature his plans. He then boldly supplied the deficit by imposing an income-tax on all incomes above £150 a year. He accompanied this tax with a reform of the tariff, by which prohibitory duties were removed and other duties abated on a vast number of consumer’s goods. The importers of many domestic manufactures and prime articles of food. The increased consumption, as the reformer expected, counterbalanced the reduction of duty. The income-tax was renewed and the reform of the tariff carried still farther on the same principle in 1845. The result was, in place of a deficit of upwards of two millions, a surplus of five millions in 1845, and the removal of seven millions and a half of taxes up to 1847, not only without loss, but with gain to the ordinary revenue of the country. The prosperous state of the finances and of public affairs also permitted a reduction of the interest on a portion of the national debt, giving a yearly saving at once of £625,000, and ultimately of a million and a quarter to the public. In 1844 another great financial measure, the Bank Charter Act, was passed and, though severely controverted and thrice suspended at a desperate crisis, has ever since regulated the currency of the country. In Ireland O’Connell’s agitation for the repeal of the Union had now assumed threatening proportions, and verged upon rebellion. The great agitator was prosecuted, with his chief adherents, for conspiracy and sedition; and though the conviction was quashed in the court of Queen’s Bench, repeal was quelled in its chief. At the same time a healing hand was extended to Ireland. The Charitable Bequests Act gave Roman Catholics a share in the administration of charities and legal power to endow their own religion. The allowance to Maynooth was largely increased, notwithstanding violent Protestant opposition. Three queen’s colleges, for the higher education of all the youth of Ireland, without distinction of religion, were founded, notwithstanding violent opposition, both Protestant and Roman Catholic. The principle of toleration once accepted, was thoroughly carried out. The last remnants of the penal laws
were swept from the statute-book, and justice was extended to the Roman Catholic Church in Canada and Malta. In the same spirit Peel introduced legislation for the dissolution of Irish Presbyterian marriages, for settling the titles of a large number of dissenters' chapels in England, and removing the municipal disabilities of the Jews. The grant for national education was trebled, and an attempt was made, though in vain, to introduce effective education clauses into the factory bills. To the alienation of any part of the revenues of the Established Church Sir Robert Peel would never consent; but he had issued the ecclesiastical commission, and he now made better provision for a number of populous parishes by a redistribution of part of the revenues of the Church. The weakest part of the conduct of this great government, perhaps, was its failure to control the railway mania by promptly laying down the lines on a government plan. It passed an act in 1844 which gave the government a right of purchase, and it had prepared a palliative measure in 1846, but was compelled to sacrifice this, like all other secondary measures, to the repeal of the corn laws. It failed also, though not without an effort, to avert the great schism in the Church of Scotland. Abroad it was as prosperous as at home. It had found disaster and disgrace in Afghanistan. It speedily ended the war there, and in India the invading Sikhs were destroyed upon the Sutlej. The sore and dangerous questions with France, touching the right of search, the war in Morocco, and the Tahiti affair, and with the United States touching the Maine boundary and the Oregon territory, were settled by negotiation.

Yet there were malcontents in Sir Robert Peel's party. The Young Englanders disliked him because he had hoisted the flag of Conservatism instead of Toryism on the morrow of the Reform Bill. The strong philanthropists and Tory Chartists disliked him because he was a strict economist and an upholder of the new poor law. But the fatal question was protection. That question was being fast brought to a crisis by public opinion and the Anti-Corn-Law League. Sir Robert Peel had been recognized in 1844 by the Duke of Devonshire, Freere Turner, and after expediency in office he had become in private more and more protectionist. Since his accession to power he had lowered the duties of the sliding scale, and thereby caused the secession from the cabinet of the duke of Buckingham. He had alarmed the farmers by admitting foreign cattle and meat under his new tariff, and by admitting Canadian corn. He had done his best in his speeches to put the maintenance of the corn laws on low ground, and to wean the landed interest from their reliance on protection. The approach of the Irish famine in 1845 turned decisively the wavering balance. When at first Sir Robert proposed to his cabinet the revision of the corn laws, Lord Stanley and the duke of Bucleuch dissented, and Sir Robert resigned. But Lord John Russell failed to form a new government. Sir Robert again came into office; and now, with the consent of all the cabinet but Lord Stanley, who retired, he, in a great speech on the 27th of January 1846, brought the repeal of the corn laws before the House of Commons. In the long and tragic debate which ensued he was carried, both by political and personal enemies, with the most virulent invective, which he bore with his wonted calmness, and to which he made no retorts. His measure was carried; but immediately afterwards the offended protectionists, led by Lord George Bentinck and Benjamin Disraeli, coalesced with the Whigs, and threw him out on the Irish Coercion Bill. He went home from his defeat, escorted by a great crowd, who uncovered as he passed, and he immediately resigned. So fell a Conservative government which would otherwise have probably ended only with the life of its chief.

Though out of office he was not out of power. He had "lost a party, but won a nation." The Whig ministry which succeeded him leant much on his support, with which he never tazed them. He joined them in carrying forward free-trade principles by the repeal of the navigation laws. He helped them to promote the principle of religious liberty by the bill for the emancipation of the Jews. One important measure was his own. While in office he had procured, by the Devon commission of inquiry, the sores of Ireland connected with the ownership and occupation of land. In 1849, in a speech on the Irish Poor Laws, he first suggested, and in the next year he aided in establishing, a commission to facilitate the sale of estates in a hopeless state of encumbrance. The Encumbered Estates Act made no attempt, like later legislation, to secure by law the uncertain customary rights of Irish tenants, but it transferred the land from ruined landlords to solvent owners capable of performing the duties of property towards the people. On the 28th of June 1850 Sir Robert Peel made a great speech on the Greek question against Lord Palmerston's foreign policy of interference. This speech was thought to show that if necessary he would return to office. It was his last. On the following day he was thrown from his horse on Constitution Hill, and mortally injured by the fall. Three days he lingered and on the fourth (July 2, 1850) he died. All the tributes which respect and gratitude could pay were paid to him by the sovereign, by parliament, by public men of all parties, by the country, by the press, and, above all, by the great towns and the masses of the people to whom he had given "bread unblemished with injustice." He would have been buried among the great men of England in Westminster Abbey, but his will desired that he might be laid in Drayton church. It also renounced a peerage for his family, as he had before declined the garter for himself when it was offered him by the queen through Lord Aberdeen.

Those who judge Sir Robert Peel will remember that he was bred a Tory in days when party was a religion; that he entered parliament a youth, was in office at twenty-four and secretary for Ireland at twenty-five; that his public life extended over a long period of life with change; and that his own changes were all forward and with the advancing intellect of the time. They will enumerate the great practical improvements and the great acts of legislative justice of those days, and note how large a share Sir Robert Peel had, if not in originating, in giving thorough practical effect to them. They will reflect that as a parliamentary statesman he could not govern without a party, and that it is difficult to govern at one time for a party and for the public. They will think of his ardent love of his country, of his abstinence from intrigue, violence and faction, of his boundless labour through a long life devoted to the public service. Whether he was a model of statesmanship may be doubted. Models of statesmanship are rare, if by a model of statesmanship is meant a great administrator and party leader, a great political philosopher and a great independent orator, all in one. But if the question is whether he was a ruler loved and trusted by the English people there is no arguing against the tears of a nation.

Those who wish to know more of him will consult his own posthumous Memoirs (1856), edited by his literary executors Earl Stanhope and V. S. Parnell; and the edition of his private correspondence, edited by C. S. Parker (1891-1899); the four volumes of his letters; a sketch of his life and character by Sir Lawrence Peel (1860); an historical sketch by Lord Dalling (1874); Guizot's Sir Robert Peel (1881); Disraeli's Lobs and Reden Sir Robert Peel's (1881); Sir Robert Peel's Life George Bentinck (1885); Morley's Life of Lord Peel (1885); A Life of Sir J. Graham (1907), by C. S. Parker; Lord Stanhope's Life of Lord Aberdeen (1891); and the general histories of the time.

Four of Sir Robert's five sons attained distinction. The eldest, Sir Robert Peel (1822-1865), who became the 3rd baronet on his father's death, was educated at Harrow and at Christ Church, Oxford. He was in the diplomatic service from 1844 to 1850, when he succeeded his father as member of parliament for Tamworth, and he was chief secretary to the lord-lieutenant of Ireland from 1851 to 1865. He represented Tamworth until the general election of 1880; in 1884 he became member for Huntingdon and in 1885 for Blackburn, but after 1886 he ceased to sit in the House of Commons. Sir Robert described himself as a Liberal-Conservative, but in his later years he opposed the policy of Gladstone, although after 1886 he championed the cause of home rule for Ireland. In 1871 he sold his father's collection of pictures to the National Gallery for £75,000, and in his later life he was troubled by financial difficulties. Sir Robert was interested in racing, and was known on the
turf as Mr F. Robinson. He died in London on the 9th of May 1895, and was succeeded as 4th baronet by his son, Sir Robert Peel (b. 1867).

Sir Frederick Peel (1824–1906), the prime minister's second son, was educated at Harrow and at Trinity College, Cambridge, becoming a barrister in 1849. He entered parliament in that year, and with the exception of the period between 1857 and 1859 remained in the House of Commons until 1865. In 1851–1852 and again in 1853–1855 he was under-secretary for the colonies; from 1855 to 1857 he was under-secretary for war; and from 1859 to 1865 he was secretary to the treasury. He became a privy councillor in 1857 and was knighted in 1860. Sir Frederick Peel's chief service to the state was in connexion with the railway and canal commission. He was appointed a commissioner on the inception of this body in 1857, and was its president from the 5th of August in 1858, remaining a member of the commission until his death on the 6th of June 1906.

The third son was Sir William Peel (1839–1859), and the youngest Viscount Peel (g.v.). Sir William was a sailor, who distinguished himself in the Crimea, where he gained the Victoria Cross, and also during the Indian Mutiny, being wounded at the relief of Lucknow. He died on the 27th of April 1858. Sir William wrote A Ride through the Nubian Desert (1852), giving an account of his travels in 1851.

Two of Sir Robert Peel's brothers were also politicians of note. William Yates Peel (1799–1858), educated at Harrow and at St John's College, Cambridge, was a member of parliament from 1817 to 1837, and again from 1847 to 1852; he was under-secretary for India from 1828, and was a lord of the treasury in 1830 and again in 1834–1835. Jonathan Peel (1799–1879) was first a soldier and then a member of parliament during the long period between 1826 and 1868, first representing Norwich and then Huntingdon. From 1841 to 1846 he was surveyor-general of the ordnance, and in 1855 and 1856 and again in 1866–1867 he was a very competent and successful secretary of state for war. General Peel was also an owner of racehorses, and in 1844 his horse Orlando won the Derby, after another horse, Running Reun, had been disqualified.

For the history of the Peel family see Jane Haworth, A Memoir of the Family of Peel from the year 1600 (1836).

Peel, a seaport and watering-place of the Isle of Man, on the W. coast, 115 m. W.N.W. of Douglas by the Isle of Man railway. Pop. (1901), 3304. It lies on Peel Bay, at the mouth of the small river Neb, which forms the harbour. The old town consists of narrow streets and lanes, but a modern residential quarter has grown up to the east. On the west side of the river-mouth St Patrick's Isle is connected with the mainland by a causeway. It is occupied almost wholly by the ruins of Peel castle. St Patrick is said to have founded here the first church in Man, and a small chapel, dedicated to him, appears to date from the 9th century. There is a round tower, also of very early date, resembling in certain particulars the round towers of Ireland. The ruined cathedral of St German, has a transitional Norman choir, with a very early crypt beneath, a nave with an early English triplet at the west end, transepts, and a low and massive central tower still standing. There are remains of the bishops' palace, of the so-called Fenella's tower, famous through Scott's Peveril of the Peak, of the palace of the Lords of Man, of the keep and guardroom above the entrance to the castle, and of the Moare or great tower, while the whole is surrounded by battlements. There are also a large artificial mound supposed to be a defensive earthwork of higher antiquity than the castle, and another mound known as the Giant's Grave. The guardroom is associated with the ghostly apparition of the Moddyc Dho (black dog), to which reference is made in Peveril of the Peak. In 1597 Richard II. condemned the earl of Shrewsbury to imprisonment in Peel Castle for conspiracy, and in 1640, Sir Thomas, duke of Gloucester, received a like sentence on the ground of having compassed the death of Henry VI. by magic. Peel has a long-established fishing industry, which, however, has declined in modern times. In the town the most notable building is the church of St German, with a fine tower and spire. Peel was called by the Northmen Holen (island, i.e. St Patrick's Isle): the existing name is Celtic, meaning "fort" (cf. the peel towers of the borderland of England and Scotland).

Peel (1) The skin or rind of a fruit; thus "to peel" is to remove the outer covering of anything. The etymology of the word is closely connected with that of "pell" to plunder, surviving in "pillage." Both words are to be referred to French and thence to Latin. In French peler and piler, though now distinguished in meaning (the first used of stripping bark or rind, the second meaning to rob), were somewhat confused in application, and a similar confusion occurs in English till comparatively late. The Latin words from which they are derived are pelis, skin, and pilare, to strip of hair (pilus). (2) The name of a class of small fortified dwelling-houses built during the 16th century on the borders between Scotland and England. They are also known as "bastel-houses," i.e. "bastel-houses," and consist of a square massive tower with high pitched roof, the lower part containing a few living rooms. The entrance is on the upper floor, access being gained by a movable ladder. The vaulted ground-floor chamber served for the cattle when there was danger of attack. The word appears in various forms, e.g. pele, pele, and Latinized as pelum, &c. "Pile" is also found used synonymously, but the New English Dictionary (s.v. peel) considers the two words distinct. It seems more probable that the word is to be identified with "pale," a stake (Lat. palus). The earlier meaning of "peel" is a palisaded enclosure used as an additional defence for a fortified post or as an independent stronghold.

Peele, George (1558–c. 1598), English dramatist, was born in London in 1558. His father, who appears to have belonged to a Devonshire family, was clerk of Christ's Hospital, and wrote two treatises on book-keeping. George Peele was educated at Christ's Hospital, and entered Broadgates Hall (Pembroke College), Oxford, in 1571. In 1574 he returned to Christ Church, taking his B.A. degree in 1577, and proceeding M.A. in 1579. In 1579 the governors of Christ's Hospital requested their clerk to "discharge his house of his son, George Peele." It is not necessary to read into this anything more than that the governors insisted on his beginning to earn a livelihood. He went up to London about 1580, but in 1583 when Albericus Alasco (Albert Laski), a Polish nobleman, was entertained at Christ Church, Oxford, Peele was entrusted with the arrangement of two Latin plays by William Gager (fl. 1580–1619) presented on the occasion. He was also complimented by Dr Gager for an English verse translation of one of the Iphigenias of Euripides. In 1588 he was employed to write the Device of the Pageant borne before Woolston Dixie, and in 1591 he devised the pageant in honour of another lord mayor, Sir William Webbe. This was the Descensus Astraeae (printed in the Harleian Miscellany, 1808), in which Queen Elizabeth is honoured as Astraea. Peele had married as early as 1583 a lady who brought him some property, which he speedily dissipated. Robert Greene, at the end of his Groat's Worth, and exorts Peele to repentance, saying that he has, like himself, "been driven to extreme shifts for a living." The sorry traditions of his reckless life were emphasized by the use of his name in connexion with the apocryphal Merrie conceited Jest of George Peele (printed in 1607). Many of the stories had done service before, but there are personal touches that may be biographical. He died before 1598, for Francis Meres, writing in that year, speaks of his death in his Palladis Tamia. His pastoral comedy of The Arrayment of Page, presented by the Children of the Chapel Royal before Queen Elizabeth perhaps as early as 1581, was printed anonymously in 1584. Charles Lamb, sending to Vincent Novello a song from this piece of Peele's, said that if it had been less uneven in execution Fletcher's Faithful Shepherdess "had been but a second name in the song-making." Peele shows considerable art in his flattery. Paris is arraigned before Jupiter for having assigned the apple to Venus. Diana, with whom the final decision rests, gives the apple to nuce of the competitors but to a nymph called Eliza, whose identity is confirmed by the further
an explanation, "whom some Zabeta call." The Famous Chronicle of King Edward the first, surnamed Edward Longshanks, with his returne from the holy land. Also the life of Llewellyn, rebel in Wales. Lastly, the sinking of God's Elonor, who sunde at Charingcrosse, and rose again at Potters-birth, now named Queenenith (printed 1593). This "chronicle history," formless enough, as the rambling title shows, is nevertheless an advance on the old chronicle plays, and marks a step towards the Shakespearian historical drama. The Battell of Alcazar—with the death of Captaine Stukeley (acted 1588—1589, printed 1594), published anonymously, is attributed with much probability to Peele. The Old Wives Tale, registered in Stationers' Hall, perhaps more correctly, as "The Owle ides tawe" (printed 1595), was followed by The Love of King David and fair Bethsabe (written c. 1588, printed 1599), which is notable as an example of Elizabethan drama drawn entirely from scriptural sources. Mr Fleay sees in it a political satire, and identifies Elizabeth and Leicester as David and Bathsheba, Mary Queen of Scots as Absalom. Sir Clymon and Sir Clamysdes (printed 1599) has been attributed to Peele, but on insufficient grounds.

Among his occasional poems are "The Honour of the Garter," which has a preface containing Peele's judgments on his contemporaries, and Poem to the Duke of Glocester (1590), a blank-verse description of the ceremonies attending the retirement of the queen's champion, Sir Henry Lee. This is concluded by the "Sonnet," "His golden locks time hath to silver turn'd," quoted by Thackeray in the 76th chapter of The Newcomes. To the Phoenix Nest in 1593 he contributed "The Praise of Chastity," Mr F. G. Fleay (Biog. Chron. of the Drama) credits Peele with The Wisdom of Doctor Dodydilp (printed 1600), Wily Begull (printed 1606), The Life and Death of Jack Straw, a notable rebel (1587?), a share in the First and Second Parts of Henry VI., and on the authority of Wood and Winstanley, Alphonse, Emperor of Germany.

Peele belonged to the group of university scholars who, in Greene's phrase, "spent their wits in making plays." Greene went on to say that he was "in some things rarer, in nothing inferior," to Marlowe. Nashe in his preface to Greene's Mona-phon called him "the chief supporter of pleasance now living, the Atlas of Poetrie and primus verborum artifices," whose first encrease, the Arraignment of Vindex, might plead to his opponent his inherent dexterity of wit and manifold variety of invention, wherein (me judicis) he goeth a step beyond all that write." This praise was not unfounded. The credit given to Greene and Marlowe for the increased dignity of English dramatic diction, and for the new smoothness infused into blank verse, must certainly be shared by Peele. Professor F. B. Gummere, in a critical essay prefixed to his edition of The Old Wives Tale, puts in another claim for Peele. In the contrast between the romantic story and the realistic dialogue he sees the first instance of humour quite foreign to the comic "business" of earlier comedy. The Old Wives Tale is a play within a play, slight enough to be perhaps better described as an interlude. Its background of rustic folk-lore gives it additional interest, and there is much fun poked at Gabriel Harvey and Stanhuryst. Perhaps Huanebangi, who parodies Harvey's hexameters, and actually quotes him on one occasion, may be regarded as representing that arch-enemy of Greene and his friends.

Peele's Works were edited by Alexander Dyce (1828, 1829—1890 and 1861); by A. H. Bullen (2 vols., 1888). An examination of the metrical peculiarities of his work is to be found in F. A. R. Lämmerhirt's Georg Péele, Untersuchungen über sein Leben und seine Werke (Kotrock, 1882). See also Professor F. B. Gummere, in Recent English Comedy (1901); and an edition of The Battell of Alcazar, printed for the Malone Society in 1907.

**PEEP-OF-DAY BOYS—PEERAGE.**

An Irish Protestant secret society, formed about 1785. Its object was to protect the Protestant peasantry, and avenge their wrongs on the Roman Catholics. The "Boys" gained their name from the hour of dawn which they chose for their raids on the Roman Catholic villages. The Roman Catholics in return formed the society of "The Defenders."

**PEEPUUL, or PEEUL (Ficus religiosa),** the "sacred fig" tree of India, also called the Bo tree. It is not unlike the banyan, and is venerated both by the Buddhists of Ceylon and the Vaishnavite Hindus, who say that Vishnu was born beneath its shade. It is planted near temples and houses; its sap abounds in caoutchouc, and a good deal of lac is obtained from insects who feed upon the branches. The fruit is about the size of a walnut and is not much eaten.

---

**PEERAGE (Fr. pairage; med. Lat. paragium; M.E. peer, fr. pair, later pair; Lat. paris, "equal").** Although in England the terms "peerage," "nobility," "House of Lords" are in common parlance frequently regarded as synonymous, in reality each expresses a different meaning. A man may be a peer and yet not a member of the House of Lords, a member of the House of Lords and yet not strictly a peer; though all peers (as the term is now understood) are members of the House of Lords either in esse or in posse. In the United Kingdom the rights, duties, and privileges of peerage are held by an individual; to the monarchical nations of the Continent nobility conveys the idea of family, as opposed to personal, privilege.

Etymologically "peers" are "equals" (parce), and in Anglo-Norman days the word was invariably so understood. The feudal tenants-in-chief of the Crown were all the peers of each other, whether lords of one manor or of a hundred; so too a bishop had his ecclesiastical peer in a brother bishop, and the tenants of a manor their peers in their fellow-tenants. That even so late as the reign of John the word was still used in this general sense is clear from Magna Carta, for the term "judicium parium" therein must be understood to mean that every man had a right to be tried by his equals. This very right was asserted by the barons as a body in 1233 on behalf of Richard, earl marshal, who had been declared a traitor by the king's command, and whose lands were forfeited without proper trial. In 1233 the French bishop Peter des Roches, Henry III.'s minister, denied the barons' right to the claim set up on the ground that the king might judge all his subjects alike, there being, he said, no peers in England (Math. Paris. 380). The English barons undoubtedly were using the word in the sense it held in Magna Carta, while the bishop probably had in his mind the French peers (pairs de France), a small and select body of feudatories possessed of exceptional privileges. In England the term was general, in technical. The change in England was gradual, and probably gathered force as the gulf between the greater barons and the lesser widened, until in course of time, for judicial purposes, there came to be only two classes, the greater barons and the rest of the people. The barons remained triable by their own order (i.e. by their peers), whilst the rest of the people rapidly became subject to the general practice and procedure of the king's justices. The first use of the word "peers" as denoting those members of the baronage who were accustomed to receive regularly a writ of summons to parliament is found in the record of the proceedings against the Despensers in 1321 (Statute, Const. Hist. ii. 257), and from that time this restricted use of the word has remained its ordinary sense.

Properly to understand the growth and constitution of the peerage it is necessary to trace the changes which occurred in the position of the Anglo-Norman baronage, first through the gradual strengthening of royal supremacy with the consequent decay of baronial power locally, and subsequently by the consolidation of parliamentary institutions during the reigns of the first three Edwards.

Before the conquest the national assembly of England (see Parliament) was the Witan, a gathering of notables owing their presence only to personal influence and standing. The imposition of a modified feudal system resulted in a radical alteration. Membership of the Great Councils of the Norman kings was primarily an incident of...
tenure, one of the obligations the tenants-in-chief were bound to perform, although this membership gradually became restricted by the operation of the Royal prerogative to a small section of the Baronial clan and eventually hereditary by custom. The Norman Councils may have arisen from the ashes of a Saxon Witenagemot, but there is little evidence of any historical continuity between the two. The Church in England, as in Christendom generally, occupied a position of paramount importance and far-reaching influence; its leaders, not alone from their special sanctity as ecclesiastics, but as practically the only educated men of the period, of necessity were among the chief advisers of every ruler in Western Europe. In England churchmen formed a large proportion of the Witan, the more influential of the great landowners making up the rest of its membership.

In place of the scattered individual and absolute ownership of Saxon days the Conqueror became practically the sole owner of the soil. The change, though not immediately completed, followed rapidly as the country settled down and the power of the Crown extended to its outlying frontiers. As Saxon land gradually passed into Norman hands the new owners became direct tenants of the king. Provided their loyal and military obligations were duly performed they had fixity of tenure for themselves and their heirs. In addition fixed money payments were exacted on the succession of the heir, when the king's eldest son was knighted, his eldest daughter married, or his person ransomed from captivity. In like manner and under similar conditions the king's tenants, or as they were termed tenants-in-chief, sub-granted the greater portion of their holdings to their own immediate followers. Under Norman methods the manor was the unit of local government and jurisdiction, and when land was given away by the king the gift invariably took the form of a grant of one or more manors.

When he brought England into subjection the Conqueror's main idea was to exalt the central power of the Crown at the expense of its feudatories, and the first two centuries following the conquest tell one long tale of opposition by the great tenants-in-chief to a steadily growing and unifying royal pressure. With this idea of royal supremacy firmly fixed in his mind, William's grants, especially to outlying territory such as the marches of Wales or the debatable ground of the Scottish border, which needed special consideration, were seldom in bulk, but took the form of manors scattered over many counties. Under such conditions it was practically impossible for a great tenant to set up a powerful imperium in imperio (such as the feof of Normandy, Brittany and Burgundy), as his forces were distributed over the country, and could be reached by the long arm of royal power, acting through the sheriff of every county, long before they could effectively come together for fighting purposes. The tenants-in-chief were termed generally barons (see Baron) and may be regarded historically as the parents of the peers of later days. The pages of Domesday (1086), the early Norman fiscal record of England, show how unevenly the land was distributed; of the fifteen hundred odd tenants mentioned the majority held but two or three manors, a fair share fewer possessed more than a hundred each. Land was then the only source of wealth, and the number of a baron's manors might well be regarded as a correct index of his importance.

The king's tenants owed yet another duty, the service of attending the King's Court (curia regis), and out of this custom grew the parliaments of later days. In theory all the king's tenants-in-chief, great and small, had a right to be present as incident to their tenure. It has therefore been argued by some authorities that as the Conqueror's system of tenure constituted him the sole owner of the land, attendance at his courts was solely an incident of tenure, the Church having been compelled to accept the same conditions as those imposed on laymen. But, as already pointed out, the change in tenure had not been immediate, and there had been no general forfeiture suffered by ecclesiastical bodies, consequently throughout the early years of William's reign some of the English bishops and abbots attended his courts as much by virtue of their personal and ecclesiastical importance as by right of tenure. The King's Court was held regularly at the three great festivals of the Church and at such other times as were deemed advisable. The assembly for several generations neither possessed nor pretended to any legislative powers. Legislative power was a product of later years, and grew out of the custom of the Estates granting supplies only on condition that their grievances were first redressed. The great bulk of the tenants were present for the purpose of ascertaining to special taxation above and beyond their ordinary feudal dues. When necessary a general summons to attend was sent through the sheriff of every county, who controlled a system of local government which enabled him to reach every tenant.

In course of time to a certain number of barons and high ecclesiastics, either from the great extent of their possessions, their official duties about the king or their personal importance, it became customary to issue a personal writ of summons, thus distinguishing them from the general mass summoned through the sheriff. That this custom was in being within a century of the Conquest is clear from an incident in the bitter fight for supremacy between Archbishop Becket and Henry II. in 1164 (Stubbs, Const. Hist. i. 504), it being recorded that the king withheld the Archbishop's personal summons to parliament, and put upon him the indignity of a summons through the sheriff. During the succeeding fifty years the line becomes even more definite, though it is evident that the Crown sometimes disregarded the custom, as the barons are found complaining that many of their number deemed entitled to a personal summons had frequently been overlooked.

The sequel to these complaints is found in Magna Carta, wherein it is provided that the archbishops, bishops, abbots, earls and greater barons are to be called up to the council by writ directed to each severally; and all those who hold the king in chief, below the rank of greater barons, are to be summoned by a general writ addressed to the sheriff of their shire. Magna Carta thus indicates the existence of two definite sections of the king's tenants, a division which had evidently persisted for some time. The "greater barons" are the immediate parents of the peerages of later days, every member of which for more than four centuries had a seat in the House of Lords. As for the rest of the tenants-in-chief, poorer in estate and therefore of less consequence, it is sufficient here to note that they fell back into the general mass of country families, and that their representatives, the knights of the shire, after some hesitation, at length joined forces with the city and burglar representatives to form the House of Commons.

In 1254, instead of the general summons through the sheriff to all the lesser tenants-in-chief, the king requires them to elect two knights for each shire to attend the council as the accredited representative of their fellows. In the closing days of 1254 Simon de Montfort summoned to meet him in 1265 the first parliament worthy of the name, a council in which prelates, earls and greater barons, knights of the shire, citizens and burgurers were present, thus constituting a representation of all classes of people. It has been argued that this assembly cannot be regarded as a full parliament, inasmuch as Simon de Montfort summoned personally only such members of the baronage as were favourable to his cause, and issued writs generally only to those counties and cities upon which he could rely to return representatives in support of his policy. Stubbs holds the view that the first assembly we ought to regard as a full parliament was the Model Parliament which met at Westminster in 1265. This parliament, unlike Simon's partisan assembly of 1254, was free and representative. To every spiritual

1 Et ab hedendum commune consilium regni...summoni barones sigillatim per litteras nostras et praetera faciemus summonerii in generale per viccemos et ballivos nostros ommes illos qui de nobis tenant in capite (cited in Stubbs, Const. Hist. i. 547 n.).
and temporal baron accustomed to receive an individual writ, one was issued. Every county elected its knights and every city or borough of any importance was instructed by the sheriff to elect and to return its allotted number of representatives. Stubbs's view (Const. Hist. ii. 223) may probably be regarded as authoritative, inasmuch as it was adopted by Lord Ashbourne in the Norfolk peerage case of 1906 (Law Reports [1907], A.C. at p. 15). Edward I. held frequent parliaments throughout his reign, and although many must be regarded as merely baronial councils, nevertheless year after year, on all important occasions, the knights of the shire and the citizens appear in their places. The parliament of Shrewsbury in 1283, for instance, has been claimed as a full parliament in several peacetime cases, but no clear decision on the point has ever been given by the Committee for Privileges. It may be taken for granted, however, that any assembly held since 1295, which did not conform substantially to the model of that year, cannot be regarded constitutionally as a full parliament. The point is even of modern importance, as in order to establish the existence of a barony by writ it must be proved that the claimant's ancestor was summoned by individual writ to a full parliament, and that either he himself or one of his direct descendants was present in parliament.

It is now convenient to consider the various grades into which the members of the peerage are grouped, and their relative positions. An examination of the early writs issued to individuals shows that the baronage consisted of archbishops, bishops, abbots, priors, earls and barons. In course of time every member of these classes came to hold his land by feudal tenure from the Crown, and eventually in every instance the writs issued as an incident of tenure. It is therefore necessary to discover, if possible, what combination of attributes clothed the greater baron with a right to receive the king's personal writ of summons. While the archbishops and bishops received their writs with regularity, the summonses to heads of ecclesiastical houses and greater barons were intermittent. The prelate held an office which lived on regardless of the fate of its temporary holder, and if by reason of death, absence or translation the office became vacant, a writ still issued to the "Guardian of the Spirituallities." The abbot, on the other hand, often outside the jurisdiction of the English Church, and owing allegiance to a foreign order, was but the personal representative of a land-holding community. It has already been pointed out that the amount of land held direct from the king by individuals varied greatly, and that the extent of his holding must have had something to do with a man's importance. A landless noble in these days was inconceivable. The conclusion, then, may be drawn that in theory the issue of a writ was at the pleasure of the Crown, and that in practice the moving factor in the case of the prelates was office and personal importance, and in the case of abbots and barons probably, in the main, extent of possession. There is nothing however to show that in the early years of the custom any person had a right to claim a writ if it were the king's pleasure or caprice to withhold it and to treat everyone not summoned individually as being duly summoned under the general writs issued to the sheriff of the county.

The next point for consideration is when did the peerage, as the baronage subsequently came to be called, develop into a body definitely hereditary? Here again growth was gradual and somewhat obscure. Throughout the reigns of the Edwards summonses were always issued to the same individual for successive parliaments; and it is quite certain that the king never considered the issue of one writ to an individual bound the Crown to its repetition for the rest of his life, much less to his heirs in perpetuity. Again we must look to tenure for an explanation. The custom of primogeniture tended to secure estates in strict family succession, and if extent of possession had originally extracted the acknowledgment of a personal summons from the Crown it is more than probable that as successive heirs came into their inheritance they too would similarly be acknowledged. In early days the summons was a burden to be suffered of necessity, an unpleasant incident of tenure, in itself undesirable, and probably so regarded by the majority of recipients during at least the two centuries following the Conquest. The age of the Edwards was in the main a rule of settled law, of increase in population generally, of growing power in the large landowners and of opportunities for those about the person of the king. The times were changing, and in place of the idea of the writ being a burden, its receipt gradually came to be looked upon as a mark of royal favour, a recognition of position and an opportunity leading on to fortune. Once such a view was established it is easy to understand how desirable any individual would be to preserve so valuable a privilege for his posterity; and with growth with its strict settlement of estates pointed out an easy way. The Crown was itself an hereditary dignity; and what more natural than that it should be surrounded by an hereditary peerage? Thus the free and indiscriminate choice of the Crown became fettered by the custom that once a summons had been issued to an individual to sit in parliament and he had obeyed that summons he thereby acquired a right of summons for the rest of his lifetime, and in later years when the doctrine of nobility of blood became established his descendants were held to have acquired the same privilege by hereditary right.

The earl's position in the baronage needs some explanation. Various suggestions have been made as to Saxon or Norman origin of a high official nature, but historical opinion seems generally to incline towards the theory that the term was a name of dignity conferred by royal prerogative on a person already classed among the greater barons. At first the dignity was official and certainly not hereditary, and the name of a county of which he is said to have been an officer in the king's name was not essential to his dignity as an earl. There were also men who, though Scottish and Norman earls, and commonly so addressed and summoned to parliament, were rated in England as barons (Lords Reports, ii. 116, 120; Earldom of Norfolk Peerage Case, Law Reports [1907], A.C. p. 18). Earls received individual summonses to parliament by the name of Earl (q.v.); but there is reason to believe, as already mentioned, that in early days at any rate they sat not in right of their earldoms but by tenure as members of the baronage.

If we review the political situation at the beginning of the 14th century a great change is evident. The line between those members of the baronage in parliament and the rest of the people is firmly and clearly drawn. The nobility; a term as the sole qualification for presence in the governmental assembly a desire to be there. In its place there appears the baronage a system of royal selection and for the rest of the people one of representation. The rules and customs of law relating to the baronage slowly crystallized so as to provide the House of Lords, the history of which for generations is the history of the peerage of England, whilst the representative part of parliament, after shedding the lower clergy, ultimately became the House of Commons.

Until the reign of Richard II. there is no trace of any use of the term baron (q.v.) as importing a personal dignity existing apart from the tenure of land, barons owing their seats in parliament to tenure and writ combined. This is borne out by the fact that a husband was often summoned to parliament in his wife's right and name, and while she lived fulfilled those feudal, military and parliamentary obligations attached to her lands whilst the physical disabilities of sex prevented her from coming out in her own person (Pike, House of Lords, p. 123).

Primogeniture, a custom somewhat uncertain in early Anglo-Norman days, had rapidly developed into a definite rule of law. As feudal dignities were in their origin inseparable from the tenure of land it is not surprising that they too followed a similar course of descent, although as the idea of a dignity being exclusively personal gradually emerged, some necessary deviations from the rules of law relating to the descent of land inevitably resulted. In the eleventh year of his reign Richard II. created by letters patent
John Beauchamp "Lord de Beauchamp and baron of Kyddermynter, to hold to him and the heirs of his body." These letters patent were not founded on any right by tenure of land possessed by Beauchamp, for the king makes him "for his good services and in respect of the place which he had held at the coronation (i.e. steward) and may in future hold in the king's councils and parliaments, and for his noble descent, and his abilities and discretion, one of the peers and barons of the kingdom of England; willing that the said John and the heirs male of his body issuing, should have the state of baron and should be called by the name of Lord de Beauchamp and Baron of Kyddermynter." The grant rested wholly on the grace and favour of the Crown and was a personal reward for services rendered. Here then is a barony entirely a personal dignity and quite unconnected with land. From Richard's reign to the present day baronies (and indeed all other peerage honours) have continued to be conferred by patent. The custom of summons by writ was not in any way interfered with, the patent operating merely to declare the dignity and to define its devolution. Summons alone still continued side by side for many generations with summons founded on patent; but after the reign of Henry VIII, the former method fell into disuse, and during the last two hundred and fifty years there have been no new creations by writ of summons alone. So from the reign of Richard II. baronies were of two classes, the older, and more ancient in lineage summoned by writ alone, the honours descending to heirs-general, and the newer created by letters patent, the terms of which governed the issue of the summons and prescribed the devolution of the peerage in the line almost invariably of the direct male descendants of the person first ennobled. The principle of hereditary succession so clearly recognized in the Beauchamp creation is good evidence to show that a prescriptive right of hereditary summons probably existed in those families whose members had long been accustomed to receive individual writs. By the time the House of Lancaster was firmly seated on the throne it may be taken that the peerage had become a body of men possessing well-defined personal privileges and holding personal dignities capable of descending to their heirs.

The early origin of peerages was so closely connected with the tenure of land that the idea long prevailed that there were originally peerages by tenure only, i.e. dignities or titles annexed to the possession (and so following it on alienation) of certain lands held in chief of the king. The older writers, Glanville (bk. ix. cc. 4, 6) and Bracton (bk. ii. c. 16), lend some colour to the view. They are followed, but not very definitely, by Coke, Selden and Madox. Blackstone, who discusses the question in his Commentaries (bk. i. c. xii.), seems to believe that such dignities existed in pre-parliamentary days but says further: "When alienations grew to be frequent, the dignity of peerage was confined to the lineage of the party ennobled, and instead of territorial became personal." The Earldom of Arundel case, in 1433, at first sight seems to confirm the theory, but it may be noted that when in later years this descent came to be discussed the high authority of Blackstone was quoted as an argument for the continued devolution of the dignity to the heir.

The case is discussed at some length in the Lords Reports (ii. 115), the committee regarding it as an anomaly from which no useful precedent can be drawn. Other cases discussed in the same Report are those of De Lisle, Abergavenny, Fitzwalter and Berkeley. The Berkeley case of 1585–1601 (better reported 8 H.L.C. 21) is essential for the student who wishes to examine the question carefully; and may be regarded as finally putting an end to any idea of bare tenure as an existing means of establishing a peerage right (see also Cruise on Dignities, 2nd ed. pp. 60 et seq.).

The main attribute of a peerage is that it is hereditary and inalienable quality which ennobles the blood of the holder and his heirs, or, as a great judge put it in 1625 in the Earldom of Oxford case, "he cannot alien or give away this inheritance because it is a personal dignity annexed to the posterity and fixed in the blood" (Dodridge, J., at p. 123, Sir W. Jones's Reports). Were the theory of barony by tenure accepted it would be possible for the temporary holder of such a barony to sell it or even to will it away to a stranger possessing none of the holder's blood, with the effect that, in the words of Lord Chancellor Campbell (Berkeley case, 8 H.L.C. 77), "there might be various individuals and various lines of peers successively ennobled and created peers of parliament by a subject," an impossible condition of affairs in a country where the sovereign has always been the fount of honour. Moreover, while no peerage honour can be extinguished or surrendered, the owner of lands can freely dispose of such rights as he possesses by sale or transfer. Finally we may accept the verdict in the Fitzwalter case of 1669 (Cruise, ibid. p. 66), which was adopted by the House of Lords in the Berkeley case: "and the nature of a barony by tenure being discussed, it was found to have been discontinued for many ages, and not in being, and so not fit to be revived or to admit any pretence or right of succession thereupon."

Until the reign of Edward III the peerage consisted only of high ecclesiastics, earls and barons. The earls were barons with their special name of dignity added, and their names always appear on the rolls before those of the barons. In 1337 King Edward created his son, the Black Prince, duke of Cornwall, giving him precedence over the rest of the peerage. The letters patent (under which the present heir to the throne now holds the dukedom) limited the dignity in perpetuity to the first-born son of the king of England. Subsequently several members of the royal family were created dukes, but no subject received such an honour until fifty years later, when Richard II. created his favourite Robert de Vere, earl of Oxford, duke of Ireland (for life). The original intention may have been to confine the dignity to the blood royal, but with the exception of de Vere it was some years before a dukedom was again conferred on a subject.

In 1385 Richard II. had created Robert de Vere marquess of Dublin, thus importing an entirely new and unknown title into the peerage. The grant was, however, only for life. Marquesses and was in fact resumed by the Crown in 1387, when its recipient was created duke of Ireland. It was not until 1397 that another creation was made, this time in favour of one of the blood royal, John de Beaumont, eldest legitimated son of John of Gaunt, who became marquess of Dorset. His title was shortly afterwards taken away by Henry IV's first parliament. Subsequently creations were made only at long intervals, that of Winchester (1531) being the only one (of old date) under which an English marquess at present sits in the House of Lords (see Marquess). Under the name of viscount (q.v.) Henry VI. added yet another order, and the last in point of time, to the peerage, creating in 1415, John, Baron Beaumont, Viscount Beaumont. The House of Lords have added to this group, and giving him precedence next above the barons. The name of this dignity was also borrowed from the Continent, having been in use for some time as a title of honour in the king's French possessions. None of the new titles above mentioned ever carried with them any official position; they were conferred originally as additional honours on men who were already members of the peerage.

The application of the hereditary principle to temporal peerages early differentiated their holders from the spiritual peers. Both spiritual and temporal peers were equally lords of parliament, but hereditary preten- sions on the one side and ecclesiastical exclusiveness on the other soon drew a sharp line of division between the two orders. Gradually the temporal peers, strong in their doctrine of "ennobled" blood, came to consider that theirs was an order...
above and beyond all other lords of parliament, and before long, arrogated to themselves the exclusive right to be called peers, and as such the only persons entitled to the privileges of peerage.

In early parliamentary days it had been the custom to summon regularly to attend the Lords for deliberative purposes another body of men—the judges. Less important than the prelates, they also owed their summons to official position, and like them were eventually overshadowed by the hereditary principle. The force of hereditary right gave to ennobled blood a position never possessed by either judge or prelate. It is true the prelate, in point of antiquity, was senior to both earl and baron, and in many cases superior in extent of possessions; but these attributes belonged to his office, the resignation or deprivation of which would at any time have caused him to lose his wrft of summons. The writ issued really to the office. The judge's position was even worse. His judicial office evoked the writ, but at any moment he might be deprived of that office at the arbitrary pleasure of the Crown. It is doubtful whether the judges ever had voice and vote in the same sense as the other lords of parliament, and even if they had they soon came to be regarded merely as counsellors and assessors.

The pretensions of the lay peers were not admitted without a struggle on the part of the prelates, who made the mistake of aiming at the establishment of a privileged position for their own order while endeavouring to retain every right possessed by their lay brethren. They fell between two stools, lost their position as peers, and were beaten back in their fight for ecclesiastical privilege. In the reign of Richard II. the prelates are found clearly defining their position. Neville, archbishop of York, de Vere, duke of Ireland and others, were "appealed" for treason, and the archbishop of Canterbury took the opportunity in parliament of making clear the rights of his order. He said "of right and by the custom of the realm of England it belongs to the Archbp of Canterbury for the time being as well as others his suffragans, brethren and fellow bishops, abbots and priors and other prelates whatsoever, holding of our lord the king by barony, to be present in all the king's parliaments whatsoever as Peers of the Realm aforesaid, and there with the other Peers of the Realm, and with other persons having the right to be there present, to advise, treat, ordain, establish and determine as to the affairs of the realm and other matters there wanting to be treated and to do all which there presses to be done." After this he went on to say that as to the particular matters in question they intended to be present and to take their part in all matters brought before parliament "save our estate and order and that of each of the prelates in all things. But because in the present parliament there is question of certain matters, in which it is not lawful for or profane the prelates according to the institute of the Holy Canons in any manner, to take part personally we intend to retire "saving always the rights of our peereage" (Rot. Parl. 11 Rich. II. No. 6—printed iii. 256—257). At the desire of the prelates this statement of their rights was duly enrolled in parliament, but their claim to be peers was neither denied nor admitted, and the proceedings went on without them. For themselves Churchmen never claimed the privilege of trial by peers. Whenever they were arraigned they claimed to be altogether outside secular jurisdiction, and it was therefore a matter of small concern to them whether they were in the hands of peers or peasants. Such was the attitude of Becket towards Henry II. (Stubbs, Const. Hist. i. 504), of Archbishop Stratford towards Edward III. (Plke, pp. 188 seq.), and it was probably with the history of these two cases in his mind that the archbishop of Canterbury, in the Act of Settlement for the Crown of Scotland, treated of the law relating to the bishops of, and archbishops of, the Scottish principalities. These rights were never willingly admitted in England, and as the pope's power for interference waned so the prelates were forced under the ordinary law of the land. Henry VIII. certainly never regarded ecclesiastics as peers, as may be gathered from a grant early in his reign to the then abbot of Tavistock for himself and each succeeding abbot the right to be "one of the spiritual and religious lords of parliament." As to abbots, the subsequent dissolution of the monasteries put an end to the discussion. In this reign also Cranmer and Fisher, though the former was archbishop of Canterbury, were tried by a common jury, and they certainly claimed no privilege of peerage. The Standing Orders of the House of Lords for 1625 contain the statement that "Bishops are only Lords of Parliament and not Peers" (Lords Journals, iii. 349). In 1633 the "Lords Spiritual" were altogether excluded from the House of Lords by act of parliament, and were not brought back until the second year of the Restoration. From that period there has been no question as to their position. Peers and holders by barony when parliaments first met, by the end of the 15th century they had put themselves outside the pale of the peerage. To-day their ancient lands are vested in trustees (Ecclesiastical Commissioners), and office alone constitutes a bishop's qualification, and that only if he occupies one of the five great sees of Canterbury, York, London, Durham and Winchester, or is of sufficient seniority in appointment to fill one of the remaining twenty-one places on the bench of bishops in the house—for there are now only twenty-six seats for thirty-six prelates.

The reign of Henry VIII. brought about far-reaching changes in the position of the peerage. When that king ascended the throne the hereditary element was in a decided minority, but the balance was gradually redressed until at length a bare hereditary majority was secured and the dissolution of the monasteries made possible. The peers, many now grown fat on abbey lands, at once began to consolidate their position; precedents were eagerly sought for, and the doctrine of ennobled blood began to find definite and vigorous expression. So long, the peers declared, as there is any ennobled blood, a peerage must exist; and it can be extinguished only by act of parliament, failure of heirs, or upon corruption of blood by attainder. Stubbs writes with some contempt of the doctrine (Const. Hist. iii. 458 n.), apparently on the ground that it is absurd to speak of ennobled blood so long as the children of a peer still remain commoners. The doctrine is neither unreasonable nor illogical. By it is meant blood in which there always exists a capacity to inherit a particular peerage, and every person in whose veins the ennobled blood runs is competent to occupy the peerage if the chances of nature should remove those who are senior to him in the line of descent. A good illustration is the popular use of the term "blood royal," which of course does not mean that an individual of the blood royal necessarily occupies a throne but that he or she is in the line of succession to it. Similarly, persons of "ennobled blood" are not necessarily peers but in the line of descent to peerages, to which they may or may not succeed. (See Nobility.)

The English peer is not like his continental brother the member of a caste, but the holder for life of an office clothed with high and exceptional legislative and judicial attributes entirely dependent on his office and exercisable only in conjunction with his fellow peers in parliament assembled. Such privileges as he possesses are due primarily to his office rather than to his blood. His children are commoners, who though accorded courtesy titles by the usage of society have no legal privileges not shared with the humbler of British subjects. It is this peculiar official quality of an English peerage which saved England from the curse of a privileged noble caste such as that which so long barred all progress in France and Germany. As a result there are hundreds of families in the United Kingdom who, commoners there, would yet, from their purity of blood, position and influence, be accounted noble in any continental country. The rule that the doctrine of nobility of blood is derived the rule of law that no peerage (a Scots peerage is under Scots Law) can be surrendered, extinguished, or in any way got rid of unless the blood be corrupted. This rule is well illustrated by the earldom of Norfolk case (Law Reports 1907, A. C. 10) in which its development was traced, and the principle authoritatively confirmed. In 1302 the hereditary earldom of Norfolk (created in 1135) was in the possession of Hugh Bygod, one of the most powerful nobles of
Plantagenet days. The earl got into difficulties, and as some say, for a consideration, and others, to spite his brother and debtor, surrendered his earldom and all the lands thereto belonging, to King Edward I. from whom he subsequently received it back with an altered limitation to himself and the heirs of his body. As he was a childless old man this was probably a short life interest to the exclusion of all his relatives, the nearest of whom but for the surrender would have succeeded. Soon after Bygod died, and the earldom fell into the hands of Edward II. who granted it to his brother Thomas of Brotherton in 1312. Lord Mowrbay, the lineal descendant of this Thomas, recently came forward and claimed the earldom, but in 1606 the House of Lords decided against his claim on the ground that in law Bygod's surrender was invalid, and that therefore Edward II. had no valid power to grant this particular earldom to Thomas of Brotherton. Historically there is little to support such a decision, and indeed this rigid application of the law is of comparatively recent date. Without doubt king, nobles and lawyers alike were all agreed, right down to Tudor days, that such surrenders were entirely valid. Many certainly were made, but, according to the decision of 1606, any living heirs of line of those nobles who thus got rid of their peerage honours can, if their pedigrees be provable, come to the House of Lords with a fair chance of reviving the ancient honours. Even as late as 1663 we find the Crown, naturally with the concurrence of its legal advisers, stating in the barony of Lucas patent (1663) that, on the appearance of co-heirs to a barony, the honour may be suspended or extinguished at the royal pleasure. The royal view of the law (at any rate as to extinction) was strongly objected to by the Lords, who guarded their privileges in Stuart days even more strictly than did the Commons. As early as 1626, in the celebrated dispute over the earldom of Oxford, the lord great chamberlanship and the baronies of Bolebec, Badlesmere and Sandford, Mr Justice Dodridge, who had been called in by the Lords to advise them, said that an earl could not give away or alien his inheritance, because it was a "personal dignity annexed to the posterior and fixed in the blood." Fourteen years later, in the Grey de Ruthyn case, the Lords solemnly resolved, "That no peer of the realm can drown or extinguish his honour (but that it descends unto his descendants), neither by surrender, grant, fine nor any other conveyance to the king." In 1678 the Lords became, if possible, even more definite, in view probably of the fact that the Crown had disregarded the Grey de Ruthyn resolution, having in 1660 taken into its hands, by surrender of Robert Villiers, 2nd viscount, the viscountcy of Purbeck. In 1676 the son of the second viscount applied for his writ of summons, and on the advice of Sir William Jones, the attorney-general, who reported that "this (surrenderer) was a considerable question, never before resolved that he knew of," the king referred the whole matter to the Lords. The Lords were very explicit, being "unanimously of the opinion, and do resolve that no fine now levied, or at any time hereafter to be levied by the king, can bar such title of honour (i.e. a peer of the realm), or the right of any person claiming under him that lying in the nature of a personal dignity of such fine." On these resolutions passed in the seventeenth century, the Lords of 1606 find illegal a surrender of 1302. The result seems strange, but it is, at any rate, logical from the legal point of view. It was urged that in 1302 no real parliament, in the sense applied to those of later years, was in existence; and consequently, a resolution founded on parliamentary principles should not apply. To this answer was made: Although it may be true that the law and practice of parliament had not then crystallized into the definite shape of even a hundred years later, the "Model Parliament" was summoned seven years before Bygod's surrender, and it is necessary to have some definite occurrence from which to date a legal beginning—a point of law with which an historian can have little sympathy.

Perhaps, from the teaching of the case it may be permissible to state the rule as follows: In early days the Norman and Plantagenet kings took upon themselves to deal with the barons in a manner which, though illegal, was suffered because no one dared oppose them; but as time went on, becoming stronger and more determined to enforce their privileges and exalt their order the peers were able to compel recognition of their rights, and their resolutions in Stuart days were only declaratory of law which had always existed, but had been systematically disregarded by the Crown. This being so, resolutions of the peers deliberately and expressly laid down must, when in point, always be followed.

The application of the doctrine of corruption of blood to peerages arises out of their close connexion with the tenure of land, peerage dignities never having been regarded as personal until well on into the 14th century. Conviction for any kind of felony—and treason originally was a form of felony—was always followed by attaint. This resulted in the immediate corruption of the blood of the offender, and its capacity for inheritance was lost for ever. Such corruption with all its consequences could be set aside only by act of parliament. This stringent rule of forfeiture was to some extent mitigated by the passing in 1285 of the statute De Donis Conditionalibus (Blackstone's Commentaries, I., 116) which provided, in opposition to the operation of estates tail, that when a tenant-in-tail was attainted forfeiture extended only to his life interest. The statute De Donis was soon applied by the judges to such dignities as were entitled (e.g. dignities conferred by patent with limitations in tail), but it never affected baronies by writ, which were not estates in tail but in the nature of estates in fee simple descended to heirs general. In the reign of Henry VIII. an act was passed (1534) which brought estates tail within the law of forfeiture, but for high treason only. The position then became that peerages of any kind were forfeitable by attaint following on high treason, while baronies by writ remained as before forfeitable for attaint following on felony. In 1708, just after the Union with Scotland, an act was passed by which on the death of the Pretender and three years after Queen Anne's death the effects of corruption of blood consequent on attaint for high treason were to be abolished, and the actual offender only to be punished (stat. 7 Anne, c. 21, § 10). Owing to the 1745 rising, the operation of this act was postponed until the decease of the Pretender and all his sons (stat. 17 Geo. II. c. 39, § 3). In 1814 forfeiture for every crime other than high and petty treason and murder was restricted to the lifetime of the person attainted (stat. 54 Geo. III. c. 143). Finally in 1870 forfeiture, except upon outlawry, was altogether abolished and it was provided that "no judgment of or for any treason or felony should cause any attaint for corruption of blood, or any forfeiture or escheat." The necessity for ascertaining the exact condition of the law with regard to attaint throughout the whole period of English parliamentary history will be realized when it is remembered that there still exist dormant and abeyant peerages dating from 1295 onwards which may at any time be the subject of claim before the House of Lords, and if any attainers exist in the history of such peerages the law governing their consequences is not the law as it exists to-day but as it existed when the attainter occurred. The duty of the law is to ascertain to which of these cases the effect of attaint on a peerage where the person attainted does not actually succeed. John first duke of Atholl died in 1725 leaving two sons James and George. George the younger was attainted of treason in 1745 and died in 1760, leaving a son John. James, the second son of the first duke, who had succeeded his father in 1725 died in 1764 without issue. John his nephew then claimed the dukedom, and was allowed it on the ground that his father never having been in the possession of the dukedom his attainter could not bar his son, who succeeds by reason of his heirship to his uncle. It would have been otherwise had the younger son outlived his brother, for he would then have succeeded to the dukedom and so destroyed it by his attaint. In many cases there have been passed special parliamentary acts of attaint and forfeiture, and these, of course, operate apart from the general law. In any event, attaint and forfeiture of a dignity, whether resulting from the rules of the common law or from special or general acts of parliament can
only be reversed by act of parliament. The procedure in reversing an attainder and recovering a dignity is as follows. The Crown signifies its pleasure that a bill of restoration shall be prepared and signs it. The bill is then brought in to the House of Lords, passed there, and sent to the Commons for assent. The last bills of the kind became law in 1876, when Earl Cowper procured the removal of the attainder on one of his Ormond ancestors and so by purging the blood of corruption became entitled to, and was allowed, the barony of Butler of Moore Park (created in 1663). There should also be noted the Earlom of Mar Restoration Act 1885, which, while mainly confirmatory of a disputed succession, at the same time reversed any attainders that existed.

The House of Lords grew steadily throughout the Tudor period, and during the reign of the first two Stuarts underwent a still greater increase. In the Great Rebellion the majority of the peers were the king’s stoutest supporters and thus inevitably involved themselves in the ruin of the royal cause. Immediately after the execution of Charles I the Republicans proceeded to sweep away everything which savoured of monarchy and aristocracy. The House of Commons passed a “useless and dangerous” bill of attainder against the Lords, which the same chamber with the same efficient dispatch of a resolution (Comms. Journ. 1648-1649, vi. 111) and placed the sole executive power in Cromwell’s hands, but there was no direct abolition of the peers as such. Evidently it took Cromwell but little time to realize the fallacy, in practice, of a single-chamber government, as he is found ten years after the “useless and dangerous” resolution busy establishing a second chamber.¹ What to call it aroused much discussion, and eventually the unruly Commons consented to speak of and deal with “the other house.” It is very difficult to realize what was the constitution of this body, so short was its life and so contemptuous its treatment by the Commons. The members of “the other house” were summoned by writs under the Great Seal, similar in form to those used to summon peers of past days. Some sixty writs were issued, and presumably their recipients were entitled thereby to sit for the duration of the parliament to which they were summoned; but it may be considered as certain that Cromwell’s lords were never considered as hereditary peers. They were entitled to the courtesy appellation “Lord” and appear to have been in the main substantial men—existing peers, judges, distinguished lawyers and members of well-known county families. Judging from Cromwell’s speech at the opening of parliament, and subsequent entries in Whitelock’s diaries, the new house appears to have had revising functions both of a legislative and judicial nature and also the duty of taking cognizance of foreign affairs. Cromwell certainly issued two patents of hereditary peerage—the barony of Burnell and the barony of Gilslain (with which went the viscounty of Howard of Morpeth), but neither title was recognized on the Restoration, and it does not appear that the possession of these titles ever conferred on their holders any hereditary right to a writ of summons to sit in “the other house.” Whitelock himself was promised a viscountcy by Cromwell, but no patent ever appears to have passed the Great Seal. Eventually business between the two houses grew impossible, and Cromwell was compelled to dissolve parliament. Richard’s first parliament also contained Lords as well as Commons, the latter considered voting “to transact business with the persons sitting in the other house as an House of Parliament, saving the right of the peers who had been faithful to the parliament,” the saving clause evidently a loophole for the future. The dissolution of this parliament and the retirement of the protector Richard into private life preceded by only a few months the restoration to the throne of Charles II. With the king the peers returned to their ancient places.

From the reign of William of Orange the peerage has been freshened by a steady stream of men who as a rule have served their country as statesmen, lawyers and soldiers. Little of note occurred in the history of the peerage until the reign of Anne. By the Act of Union with Scotland (1707) the Scottish parliament was abolished; but the Scottish peerage were given the privilege of electing, for each parliament of Great Britain, sixteen of their number to represent them in the House of Lords. Further creations in the Scottish peerage were no longer to be made. The effect of this act was to leave the great majority of the Scottish peers outside the House of Lords, as only sixteen of their number were to become lords of parliament. Close upon a hundred years later Ireland was united with Great Britain, the Irish parliament being merged in the Irish Representative Peers. Twenty-eight Irish peers were to be elected for life by their order to represent it in the House of Lords. One archbishop and three bishops were also chosen in turn to represent the Irish Church in the House of Lords, but when that Church was disestablished in 1867 the spiritual lords lost their seats. The merger of the three kingdoms had an important effect on their peerages. Every peer in his own kingdom was by the laws of that kingdom a lord in the right. The English peer (and, after the Acts of Union were passed, the peer of Great Britain and the peer of the United Kingdom) continued by hereditary right a lord of parliament. The Scottish and Irish peers lost this right though by the two Acts of Union they retained every other privilege of peerage. Henceforth they were lords of parliament only as and when their fellow peers elected them. Thus though not all were lords of parliament in esse, every one was always so in posse, and in any case it was the hereditary quality of the peerage which either actually seated its holder in the House of Lords or made it possible for him to get there by the votes of his fellows.

It now becomes possible to arrive at the modern meaning of the term “a peerage,” and we may define it as a dignity of England, Scotland or Ireland, which, by its hereditary quality, confers on its holder for the time being the right to be or not to be elected a lord of parliament. The term “peerage” is also used in a collective sense.

The reign of Anne is remarkable for an attempt made by the House of Lords to limit its numbers by law. The queen, in order to secure a majority for the court party, had created a batch of twelve peers at one time, a considerable number in relation to existing peerages; and it was feared this expedient might be used as a precedent. A peerage limitation bill was introduced into the House of Lords in 1710. Six new creations were to be allowed, but after these the Crown, except in the case of royal princes, was to create a new peerage only when an old one became extinct. Twenty-five hereditary peerages in Scotland were to be taken the place of the sixteen representative peers for all time. The bill passed the Lords, but was eventually thrown out in the House of Commons, though not by an overwhelming majority. In 1856 it was desired to strengthen the judicial element in the House of Lords, and the Crown issued letters patent creating Sir James Parke, one of the barons of the exchequer, Baron Wensleydale and a peer for the term of his natural life. The burden of an hereditary peerage is heavy, and many men thoroughly well qualified in legal attainments have been known to refuse it on the ground of expense alone. This life-peerage was thought to be a way out of the difficulty, and it was on Lord Chancellor Cranworth’s advice that the Crown issued the Wensleydale patent. The House of Lords at once realized that the creation of life-peers, at the will of the ministry of the day, might put the hereditary section into an absolute minority, and possibly in time, by form of law, get rid of it altogether. Eventually it was decided by the house that “neither the said letters patent nor the said letters patent with the usual writ of summons enable the grantee to sit and vote in parliament,” a formal resolution which closed the door in the face of every

¹Whitelock’s Memorials of English Affairs (in the reign of Charles I. and up to the Restoration) (1853 ed. iv. 319).
person whom the Crown might endeavour to make a life-peer. The government of the day accepted the situation, and soon afterwards a new patent was made out which followed the usual limitation to heirs-male. The precedents in favour of the Crown's action were not strong. The essential and outstanding attribute of the house was its hereditary character. The whole balance of the constitution worked on the pivot of the independence of the peers. They existed as a moderating force in the counsels of parliament, and the alteration of the hereditary character of the House of Lords might easily have rendered it amenable to whatever pressure the government of the day might see fit to exercise. In such circumstances its position as arbiter between people and government would tend to disappear. A change fraught with so many serious possibilities ought not, it was said, to be made by the simple prerogative of the Crown. If so far-reaching an alteration in the law were justifiable it was for parliament to make it. Further, it was pointed out, there had been no life-creations for centuries, and those that are recorded to have been conferred since the crystallization of our parliamentary system were of such a nature that the grantees never sat in the house by virtue of their life-honours, inasmuch as they were existing peers or women. Soon after the Wensley Debates an act was introduced to the House of Lords to authorize the creation of two life-peers, who were to be persons of at least five years' standing as judges. They were to sit as lords of appeal but to be peers for life. Eventually the bill disappeared in the House of Commons. In 1869 Earl Russell introduced another life-peerage bill of far wider scope. Twenty-eight life-peers might be in existence at any one time, but not more than four were to be created in any one year. The life peers would be lords of parliament for life. They were to be selected by the Crown from the peerages of Scotland and Ireland, persons who had sat for ten years in the Commons, distinguished soldiers, sailors, civil servants and judges or persons distinguished in science, literature or art. The bill received a rough handling in committee of the Lords, and the time was evidently not ripe for change, as the bill failed to pass its third reading.

In 1870 attempts were made in the House of Lords to alter the position of the Scottish and Irish representative peers. In 1876 the need of further judicial protection in the Scottish peerages was pointed out, and an act was passed authorizing the creation of two lords of appeal in ordinary, and power was reserved to appoint two more as certain judicial vacancies occurred. They were to be entitled to the rank of baron during their lives but were to sit and vote in parliament only so long as they held their judicial office. Their dignities lasted for life only. Eleven years later another act enabled all retiring lords of appeal to sit and vote as members of the House of Lords for life. To those interested in House of Lords reform the pages of Hansard's Parliamentary Debates are the best authority. In 1888 Reform bills were introduced by Lords Dunraven and Sallaby, and in 1907 by Lord Newton. In December 1908 the publication of a long report with sweeping recommendations for reform ended the labours of a House of Lords committee which had been appointed to consider the question in detail. In the session of 1910, following the general election, long discussions took place in both houses of parliament. Opinion generally was freely expressed that the time had arrived for diminishing the number of lords of parliament and for putting into practice the principle that instead of a large number of peers there should be a smaller number conferring lordship of the house. (See Parliament.)

The Scottish peerage, like that of England, owes its origin to feudalism. In Anglo-Norman days Scotland was a small country, and for some generations after England was settled the Scottish king's writ ran little beyond the foot of the Highlands, and even the Lord of the Isles reckoned himself an independent sovereign until the beginning of the 13th century. The weak and usually ineffective control of the Crown resulted in opportunities for acquiring personal power which the nobles were not slow to take advantage of. Seldom accustomed to act in concert, they soon developed particularist tendencies which steadily increased the strength of their territorial position. These conditions of existence were entirely unfavourable to the establishment of any system of parliamentary government such as centralization had made possible in England, therefore it is not surprising to find that the lesser barons were not relieved of their attendance at the national assemblies until well on in the 15th century (Burton's Scotland, iii. 117). Again, when the Scottish earls and barons came to parliament, they did not withdraw themselves from the rest of the people, it being the custom for the estates of Scotland to deliberate together, and this custom persisted until the abolition of their parliament by the Act of Union in 1707. The territorial spirit of the nobles inevitably led them to regard the honour as belonging to, and inseparable from, their land, and until comparatively late in Scottish history there is nowhere any record of the conferment of a personal dignity unattached to land such as that conferred in England on Beauchamp by Richard II. This explains the frequent surrenders and altered grants which are so common in Scottish peerage history, and which, in sharp distinction to the English rule of law, are there regarded as perfectly legal. To-day there exists no Scottish peerage which is not settled by a charter of the Crown appertaining to a peerage established by a grant of any kind. The titles of the old feudal lordships of Highland or viscountcy created before the reigns of James VI. of Scotland (and I. of England). Of the existing Scottish peerages sixty-three were created in the period between James's accession to the English throne and the Act of Union. There are now only eighty-seven in all. Unlike one of the English peerages owing its origin exclusively to a writ of summons, ancient Scottish peerages do not fall into abeyance, and when there are only heirs-general, the eldest heir of line succeeds. Whenever a new parliament is summoned, proclamation is made in Scotland summoning the peers to meet at Holyrood to elect sixteen of their number to represent them in such parliament. The Scottish peers are recorded on a roll, and this is called over by the lord clerk register before the assembled peers seated at a long table. Each peer answers to the name of the peerage (it may be one or more) he possesses. The roll is then read again and each peer in turn (but only once) rises and reads out the list of those sixteen peers for whom he votes. Proxies are allowed for absent peers and are handed in at the door of the hall. The lord clerk register reads out the names of those elected, makes a return, and signs and seals it in the presence of the peers assembled. The return eventually finds its way to the House of Lords. The Scottish representative peer so elected receives no writ of summons to parliament, but attends the House of Lords to take the oath, his right to sit being evidenced by the return made. It might be thought that the rules of election in so important a matter would be more stringent, but the fact remains that it is quite possible for an entirely unqualified person to attend and vote at Holyrood. No evidence of identity or of a man's right to be present is required and the lord clerk register is compelled to receive any vote tendered except in respect of peerages for which no vote has been given since 1800, these being struck off the roll (10 & 11 Vict. c. 52). Any person claiming to represent such a peerage must prove his right before the House of Lords, as was done in the case of the barony of Fairfach in 1908. It is true that by the act last cited any two peers may protest against a vote at Holyrood, and the lord clerk register thereupon reports the proceedings to the House. He is compelled to consider the question if application be made for an inquiry, but nothing is done unless an application is made. The right to vote certainly needs better proof than that now accepted. For many years the House of Lords maintained that the Crown could not confer a new peerage of Great Britain on a Scottish peer, the ground being that the Scottish peerage was only entitled to the sixteen representative peers given it by the Act of Union, but eventually in 1782 in the case of the duke of Hamilton this contention was given up.

The Anglo-Norman conquerors of Ireland carried with them the laws and the system of tenure to which they were accustomed.
in England, and consequently the growth of the baronage and the establishment of parliamentary government in Ireland proceeded on parallel lines with the changes which occurred in England. Until the reign of Henry VIII. the Irish were without representation in parliament, but gradually the Irish were admitted, and by the creation of new parliamentary counties and boroughs were enabled to elect representatives. In 1613 the whole country shared in representation (Ball’s Legislative Systems of Ireland). Just as James I. had added many members to the Scottish peerage, so he increased the number of Irish peers.

In 1800 the Union of Great Britain and Ireland abolished the parliament of Ireland. By the Act of Union the Irish peers became entitled to elect twenty-eight of their number to represent them in the House of Lords. The election is for life, and only those peers are entitled to vote at elections of representative peers who have proved their right of succession to the satisfaction of the lord chancellor, who issues his notice to that effect after each individual proof. The names of such peers are added to the voting-roll of the peerage, and when voting papers are distributed—Irish peers do not vote for election purposes as do the peers of Scotland—they are sent only to those peers who have proved their right to vote. If any claim to the right to vote is rejected by the lord chancellor the claimant must prove his case before the Committee for Privileges (barony of Graves, 1807). When an Irish peer has been elected a representative peer he receives, as a matter of course, a writ of summons at the beginning of each parliament. The great bulk of the Irish peerage owes its existence to creations during the last two centuries, only seven of the existing peerages dating back beyond the 17th century; of the rest twenty-two were created during the year of Union, and thirty-three have been added since that date. Some hundred or more years ago ministers found the Irish peerage a useful means of political reward, in that it was possible to bestow a title of honour, with all its social prestige, and yet not to increase the numbers of the House of Lords.

On the death of a representative peer of Scotland or Ireland a vacancy occurs and a new election takes place, but in accordance with modern practice promotion to a United Kingdom peerage does not vacate the holder’s representative position (May’s Parliamentary Practice, p. 11 n.). Scottish and Irish peers, if representative, possess all the privileges of peerage and parliament enjoyed by peers of the United Kingdom; if non-representative all privileges of peerage, except the right to a writ of summons to attend parliament and to be present at and vote in the trial of peers. A Scottish peer, if non-representative, is in the anomalous position of being disabled from serving his country in either house of parliament, but an Irish peer may sit in any House of Commons constituency out of Ireland, though while a member of the Commons his peerage privileges abate.

Although many peers possess more than one peerage, and frequently of more than one country, only that title is publicly used which is first in point of precedence. It was once argued that whenever a barony by writ came into the possession of a person already a peer of higher rank, the higher peerage “attracted” or overshadowed the lower, which thenceforth followed the course of descent of the dignity which had attracted it. This doctrine is now exploded and cannot be regarded as applying to any case except that of the Crown (Baronies of Fitzwilliam, 1660, and De Ros, 1666; Collin’s Claims, 168, 261). Every peerage descends according to the limitations prescribed in its patent of creation or its charter, and where these are non-existent (as in the case of baronies by writ) to heirs-general.

(See ABEYANCE.)

In dealing with English dignities it is essential to realize the difference between a mere title of honour and a peerage. The Crown as the fountain of honour is capable of conferring upon a subject not only any existing title of honour, but may even invent one for the purpose. So James I. instituted an order of hereditary knights which he termed baronets, and Edward VII. created the duchess of Fife “Princess Royal”—a life dignity. The dignities of prince of Wales, earl marshal and lord great chamberlain have been for centuries hereditary, and though of high court and social precedence, of themselves confer no right to a seat in the House of Lords—they are not peerages.

The grant of a peerage is a very different matter; its holder becomes thereby a member of the Upper House of Parliament, and therefore the prerogative of the Crown in creating such an office of honour must be exercised strictly in accordance with the law of the land. The Crown’s prerogative is limited in several directions. The course of descent must be known to the law; and so, in the first place, it follows that a peer cannot be created for life with a denial of succession to his descendants (unless it be as one of the lords of appeal in ordinary under the acts of 1876 and 1887). The courses of descent of modern patents are invariably so marked out as ultimately to fix the peerage in some male line according to the custom of primogeniture, though the immediate successor of the first holder may be a woman or even a stranger in blood. The following instances may be quoted: A patent of Letters of 1560 created Countess de Grey with a limitation to the heirs-male of her sister; a nephew afterwards succeeded her and the earldom is now held by the marquess of Ripon. Other courses of descent known to the law are as follows: Fee simple, which probably operates as if to heirs-general, earldoms of Oxford (1155) and Norfolk (1153), both probably now in abeyance; and Bedford (1367), extinct; to a second son, the eldest being alive, dukedom of Dover (1708), extinct, and earldom of Cromartie (1861) called out of abeyance in 1895; a son-in-law and his heirs-male by the daughter of the first grantee, earldom of Northumberland (1747); to an elder daughter and her heirs-male, earldom of Roberts (1901); to an elder or younger brother and his heirs-male, viscounty of Kitchener (1903) and barony of Grimthorpe (1886). It is, however, not lawful for the Crown to make what is called a shifting limitation to a peerage, i.e. one which might vest a peerage in an individual, and then on a certain event happening (e.g. his succession to a peerage of higher rank) shift it from him to the representative of some other line. Such a limitation was held illegal in the Buckley case (1864). A peerage may not be limited to the grantee and of his heirs-male ‘for ever.’ Such a grant was that of the earldom of Wiltes in 1398. The original grantee died without issue, but left a male heir-at-law, whose descendants in 1860 claimed the earldom, but the original limitation was held invalid.

There is no limitation on the power of the Crown as to the number of United Kingdom peerages which may be created. As to Scotland, the Act of Union with that country operates to prevent any increase in the number of Scottish peerages, and consequently there have been no creations since 1707, with the result that the Scottish peerage, as a separate order, is gradually approaching extinction. The Irish peerage is supposed always to consist of one hundred exclusively Irish peers, and the Crown has power to grant Irish peerages up to the limit. When the limit is reached no more peerages may be granted until existing ones become extinct or their holders succeed to United Kingdom peerages. Only four lords of appeal in ordinary may hold office at any one time. The number of archbishops and bishops capable of sitting in the House of Lords is fixed by various statutes at twenty-six, but, as pointed out previously, the spiritual lords are not now regarded as peers.

Since party government became the rule, the new peerages have usually been created on the recommendation of the prime minister of the day, though the Crown, especially in considering the claims of royal blood, is believed in some instances to take its own course; and constitutionally such action is entirely legal. By far the greater number of peerage honours granted during the last two centuries have been rewards for political services. Usually these services are well known, but there exists several instances in which the reasons for conferring the honour have not been quite clear. Until the reign of George III. the peerage was
comparatively small, but that monarch issued no fewer than 388 patents of peerage. Many of these have become extinct or obscured by higher titles, but the general tendency is in the direction of a steady increase, and where the peers of Tudor times might be counted by tens their successors of 1910 were numbered in hundreds. The full body would be 546 English peers. There are also 12 ladies holding English peerages. The Irish peerage has 175 members, but 82 of these are also peers of the United Kingdom, leaving 28 representative and 65 without seats in the House of Lords. Of 87 Scottish peers 51 hold United Kingdom peerages, the remainder consisting of 16 representative and 20 without seats.

As centuries have gone by and customs changed, many privileges once keenly asserted have either dropped out of use or been forgotten. The most important now in being are a seat in the House of Lords and the right to trial by peers. The right to a seat in parliament is one sanctioned by centuries of constitutional usage. The right of a peer in England to a seat in parliament was not, as pointed out in the early part of this article, entirely admitted by the Crown until late in the Plantagenet period, the king's dispensation being to warrant an act having been a very material factor in the question. Charles I. made a deliberate attempt to recover the ancient discretion of the Crown in the issue of writs of summons. The earl of Bristol was the subject of certain treasonable charges, and though he was never put on his trial the king directed that his writ of summons should not issue. The excluded peer petitioned the Lords, as for a breach of privilege, and a committee to whom the matter was referred reported that there was no instance on record in which a peer capable of sitting in parliament had been refused his writ. There was a little delay, but the king eventually gave in, and the earl had his writ (Lords Journals, iii. 544).

At the beginning of a new parliament every peer entitled receives a writ of summons issued under the authority of the Great Seal; he presents his writ at the table of the House of Lords on his first attendance, and before taking the oath. If the peer be newly created he presents his letters-patent creating the peerage to the lord chancellor on the woolack, together with the writ of summons which the patent enquires. A peer on succession presents his writ in the ordinary way, the Journals recording, e.g. that Thomas Walter, Viscount Hampden, sat first in Parliament after the death of his father (Lords Journals, cxxxix. 4). The form of writ now issued (at the beginning of a parliament: for the variation when parliament is sitting see Lords Journals, cxxxix. 185) corresponds closely to that in use so long ago as the 14th century. It runs as follows:—

George the Fifth by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the seas King Defender of the Faith to our right trusty and well-beloved Greeting Whereas by the advice and consent of our Council for our said rejuvenate affairs concerning us the state and the defence of our said United Kingdom and the Church we have ordered a certain Parliament to be holden at our City of Westminster on the . . day of . . next ensuing and there to treat and have conference with the prelates great men and peers of our realm. We strictly enjoining command you upon the faith and allegiance by which you are bound to us that the weightiness of the said affairs and imminent perils considered (waiving all excuses) you be at said day and place personally present with us and with the said prelates great men and peers to treat and give your counsel upon the affairs aforesaid. And this as you regard us and our honour and the safety and defence of the said United Kingdom and Church and despatch of the said affairs in no wise do you omit.

Formerly all peers were required to attend parliament, and there are numerous recorded instances of special grants of leave of absence, but nowadays there is no compulsion.

After the right to a summons the principal privilege possessed by a peer is his right to be tried by his peers on a charge of treason or felony. Whatever the origin of this right, and some writers date it back to Saxon times (Trial of Lord Morley, 1678, State Trials vii. 145), Magna Carta has always been regarded as its confirmatory authority. The important words are:—

nullus liber homo capitatur imprisonetur aut dissisiatur de libero tenemento suo vel libertatis seu libris consuetudinis suis, aut uulgatur aut exuletur nec aliquo modo distraeat nec dominus rex super ipsum ibit nec super eum, mittet nisi per legale judicium parum sursum vel per legem terrae.

The peers have always strongly insisted on this privilege of trial by their own order, and several times the heirs of those wrongly condemned recovered their rights and heritage on the ground that there had been no proper trial by peers (R.D.P., v. 24). In 1442 the privilege received parliamentary confirmation (stat. 20 Henry VI. c. 9). If parliament is sitting the trial takes place before the House of Lords in full session, i.e. the court of our lord the king in parliament, if not then before the court of the lord high steward. The office of lord high steward was formerly hereditary, but has not been so for centuries and is now only granted pro hac vice. When necessity arises the Crown issues a special commission naming some peer (usually the lord chancellor) lord high steward pro hac vice (Blackstone's Commentaries 298). When a trial takes place in full parliament a lord high steward is appointed, but his powers there are confined to the presidency of the court, all the peers sitting as judges of law as well as of fact. Should the lord high steward be sitting as a court out of parliament he summons a number of peers to attend as a jury, but rules alone on all points of law and practice, the peers present being judges of fact only. Whichever kind of trial is in progress it is the invariable practice to summon all the judges to attend and advise on points of law. The distinction between the two tribunals was fully discussed and recognized in 1760 (Trial of Earl Ferrers, Foster's Criminal Cases, 130). The most recent trial was that of Earl Russell for bigamy (reported 1901, A.C. 446). Among others are the Kilmarnock, Cromarty and Balmerino treason trials in parliament in 1746 (State Trials xviii. 441), and the court of the lord high steward, Lord Morley (treason, 1666, State Trials vi. 777), Lord Cornwallis (murder, 1678 State Trials vii. 145), Lord Delamere (1686, treason, State Trials xi. 510). Recently some doubt has been expressed as to the origin of the court of the lord high steward. It is said that it is not so much on which the practice is founded as a forgery. The conflicting view is set forth by Vernon Harcourt's His Grace the Steward and Trial of Peers, p. 479, and in Pike's Constitutional History of the House of Lords, p. 213. In any case, whatever its historical origin, the court for centuries as a matter of fact has received full legal recognition as part of the constitution. The right to trial by peers extends only to cases of treason and felony, and not to those of misdemeanour; nor can it be waived by any peer (Co. 3 Inst. 29; Kelyng's Rep. 56). In the case of R. v. Lord Graves (1887), discussed in Hansard's Parliamentary Debates, 3rd series, vol. cccxx. p. 246, Lord Halsbury points out that the question of trial by peers is one of jurisdiction established by law rather than a claim of privilege in the discretion of the accused. Scottish and Irish peers, whether possessing seats in the House of Lords or not, are entitled to trial by peers, the same procedure being followed as in the case of members of the House of Lords. Peers with a seat in the House of Lords possess practically the same parliamentary privileges as do members of the House of Commons. Among other privileges peculiar to themselves they have the right of personal views (Anson's Law of the Constitution, i. 227). In the House of Lords, when a resolution is passed contrary to his sentiments, any peer, by leave of the house, may "protest," that is, enter his dissent on the journals of the house (Blackstone, Comm. i. 162). Formerly a peer might vote by proxy (Blackstone, ibid.), but since 1868 there has been a standing order discontinuing this right. In accordance with resolutions passed by the two houses, neither house has power by any vote or declaration to clothe itself with new privileges unknown to the law and customs of parliament (Commons Journal, xiv. 555). Peeresses and non-representative peers of Ireland and Scotland have,
with the exception of the right to sit in the House of Lords and its attendant parliamentary privileges, every peerage privilege: a widowed peeress retains her privilege of peerage while unmarried, but loses it if she marries a commoner (Co. Litt. 166; Cowley v. Cowley [1901] A.C. 450). Dissolution of marriage probably deprives a peeress of all peerage privileges which she acquired by marriage.

The children of peers are commoners. The eldest son of a peer of the rank of earl (and above) is usually known socially by the title of his father’s next peerage, but the courtesy title is not always vested in him by his father’s will and is inherited by his eldest son, but not necessarily so. By courtesy, no question of peerage privilege arises. The younger sons of dukes and marquesses are entitled to the prefix ‘Lord’ before their Christian names, and all the daughters of earls as well as the younger sons of earls and all the younger sons of viscounts and barons are entitled to the prefix ‘Miss’ (or ‘Mrs’ if married) respectively.

Creation of Peerages.

Claims to Peerages.

In theory the Crown, as the fountain of honour, might settle any claim without reference to the House of Lords and without a writ of summons to its sitting. In fact it is not in any way prevent the House of Lords from examining the patent and writ of summons when the favoured petitioner or any heir claiming through him came to take his seat in the House. If of opinion that the patent was illegal the house might adjudge it invalid, as it did in the case of a warrant of summons, issued by King William IV, to one of the dukes of Clarence, who passed without his decedent’s peerage reverted to the father. The invariable method of creation in ordinary cases is by patent. The letters patent describe the name of the dignity, the person upon whom it is conferred, the peerage, and the seat, under the latter of which the earldom or barony reverts. Claims to peerages are of two kinds: (1) of right, (2) of grace.

Russian nobility, but his more immediate progenitors were all very poor, and unable to read or write. His grandfather ploughed the fields as a simple peasant, and his father, as Pseudemsky himself said, was washed and clothed by a rich relative, and placed as a soldier in the army, from which he retired as a major after thirty years’ service. During childhood Pseudemsky read eagerly the translated works of Walter Scott and Victor Hugo, and later those of Shakespeare, Schiller, Goethe, Rousseau, Voltair and George Sand. From the gymnasium of Kostroma he passed through Moscow University, and in 1884 entered the government service as a clerk in the office of the Crown domains in his native province. Between 1854 and 1872, when he finally quitted the civil service, he occupied similar posts in St Petersburg and Moscow. His early works exhibit a profound disbelief in the higher qualities of humanity, and a disdain for the other sex, although he appears to have been attached to a particularly devoted and sensible wife. His first novel, Boyaratchina, was forbidden for its unutterable description of the Russian nobility. His principal novels are Tufôk (“A Muff”), 1850; Teesticha doushek (“A Thousand Souls”), 1862, which is considered his best work of the kind; and Zemlenniye more (“A Hundred Chairs”), giving a picture of the excited state of Russian society about the year 1862. He also produced a comedy, Gorkaya soudchina (“A Bitter Fate”), depicting the dark sides of the Russian peasantry, which obtained for him the Ouvorooff prize of the Russian Academy. In 1856 he was set, together with other literary men, to report on the ethnographical and commercial condition of the Russian interior, his particular field of inquiry having been Astrakhan and the region of the Caspian Sea. His scepticism in regard to the liberal reforms of the 'sixties made him very unpopular among the more progressive writers of that time. He died at Moscow on the 2nd of February 1881 (Jan. 21, Russian style).

PEGAUS (from Gr. πεgamma, compact, strong), the famous winged horse of Greek fable, said to have sprung from the trunk of the Gorgon Medusa when her head was cut off by Perseus. Scyloropon caught him as he drank of the spring Pirene on the Acropolis at Corinth, or received him tamed and bridled at the hands of Athena (Pindar, Ol. xiii. 63; Pausanias ii. 5. 3). Mounted on Pegasus, Bellerophon slew the Chimaera and overcame the Solymi and the Amazons, but when he tried to fly to heaven on the horse’s back he threw him and continued his heavenly course (Apollodorus ii. 3). Arrived in heaven, Pegasus served Zeus, fetching for him his thunder and lightning (Hesiod, Theog. 281). Hence some have thought that Pegasus is a symbol of the thundercloud. According to O. Gruppe (Griechische Mythologie, i. 75, 123) Pegasus, like Arion the fabled offspring of Demeter and Poseidon, was a curse-horse, symbolical of the rapidity with which curses were fulfilled. In later legend he is the horse of Eos, the morning. The erroneous derivation from πηγη, “a spring of water,” may have given birth to the legends which connect Pegasus with water; e.g. that his father was Poseidon, that he was born at the springs of Ocean, and that he had the power of making springs rise from the ground by a blow of his hoof. When Mt Helicon, enchanted by the song of the Muses, began to rise to heaven, Pegasus stopped its ascent by stamping on the ground (Antoninus Liberalis 9), and where he struck the earth Hippocrene (horse-spring), the fountain of the Muses, gushed forth (Pausanias ii. 31, ix. 31). But there are facts that speak for an independent mythological connexion between horses and water, e.g. the sacredness of the horse to Poseidon, the epithets Hippios and Equester applied to Poseidon and Neptune, the Greek fable of the origin of the first horse (produced by Poseidon striking the ground with his trident), and the custom in Argolis of sacrificing horses to Poseidon by drowning them in a well. From his connexion with Hippocrene Pegasus has come to be regarded as the horse of the Muses and therefore as a symbol of poetry. But this is a modern attribute of Pegasus, not known to the ancients, and dating only from the Orlando innamorato of Boiardo.

PEGAU, a town of Germany, in the kingdom of Saxony, situated in a fertile country, on the Elster, 18 m. S.W. from Leipzig by the railway to Zeitz. Pop. (1905), 5,656. It has two Evangelical churches, that of St Lawrence being a fine Gothic structure, a 16th-century town-hall; a very old hospital and an agricultural school. Its industries embrace the manufacture of felt, boots and metal wares.

Pegau grew up round a monastery founded in 1096, but does not appear as a town before the close of the 12th century. Markets were held here and its prosperity was further enhanced by its position on a main road running east and west. In the monastery, which was dissolved in 1539, a valuable chronicle was compiled, the Annales Pegavienses, covering the period from 1030 to 1257. See Füssel, Anfang und Ende des Klosters St Jacob zu Pegau (Leipzig, 1857); and Dillner, Grössel and Günther, Altes und neues aus Pegau (Leipzig, 1905). The Annales Pegavienses are published in Bd. XVI. of the Monumenta Germaniae historica. Scriptores.

PEGMATITE (from Gr. πεγματις, a bond), the name given by Hali to those masses of graphic granite which frequently occur in veins. They consist of quartz and alkali feldspars in one intergrowth (see Petrology, Plate II. fig. 6). The term was subsequently used by Naumann to signify also the coarse crystalline veins rich in quartz, feldspar and muscovite, which often in great numbers ramify through outcrops of granite and the surrounding rocks. This application of the name has now obtained general acceptance, and has been extended by many authors to include vein-rocks of similar structure and geological relationships, which occur with syenites, diorites and gabbros. Only a few of these pegmatites have graphic structure or mutual intergrowth of their constituents. Many of them are exceedingly coarse-grained; in granite-pegmatites the feldspars may be several feet or even yards in diameter, and other minerals such as apatite and tourmaline often occur in gigantic crystals. Pegmatites consist of minerals which are found also in the rocks from which they are derived, e.g. granite-pegmatites contain principally quartz and feldspar while gabbro-pegmatites consist of diorite and plagioclase. Rare minerals, however, often occur in these veins in exceptional amount and as very perfect crystals. The minerals of the pegmatites are always those which were last to separate out from the parent rock. As the basic minerals are the first formed the pegmatites contain a larger proportion of the acid or more siliceous components which were of later origin. In granite-pegmatites there is little hornblende, biotite or pheinte, but white mica, feldspar and quartz make up the greater part of the veins. In gabbro-pegmatites olivine seldom occurs, but diorite and plagioclase occur in abundance. In this respect the pegmatites and aplites agree; both are of more acid types than the average rock from which they came, but the pegmatites are coarsely crystalline while the aplites are fine-grained. Segregations of the early minerals of a rock are frequent as nodules, lumps and streaks scattered through its mass, and often dikes of basic character (lamprophyres, &c.) are injected into the surrounding country. These have been grouped together as intrusions of melanocratic facies (μελανός, black, σπέριος, strength, predominance) because in them the dark basic minerals preponderate. The apatites and feldspars, on the other hand, are leucocratic (λευκός, white), since they are of acid character and contain relatively large amounts of the white minerals quartz and feldspar.

Pegmatites are associated with plutonic or intrusive rocks and were evidently formed by slow crystallization at considerable depths below the surface: nothing similar to them is known in lavas. They are very characteristic of granites, especially those which contain muscovite and much alkali feldspar; in gabbros, diorites and syenites pegmatite dikes are comparatively rare. The coarsely crystalline structure may be ascribed to slow crystallization; and is partly the result of the rocks, in which the veins lie, having been at a high temperature when the minerals of the pegmatites separated out. In accordance with this we find that pegmatite veins are nearly always restricted.
PEGNITZ—PEGOLOTTI

PEGNITZ, a river of Germany. It rises near Lindenhof in Upper Franconia (Bavaria) from two sources. At first it is called the Fichtenbo, but at Buchau it takes the name of the Pegnitz, and flowing in a south-westerly direction disappears below the small town of Pegnitz in a mountain cavern. It emerges through three orifices, enters Middle Franconia, and after flowing through the heart of the city of Nuremberg falls into the Regnitz at Fürth.

The Pegnitz Order (Order of the society of Pegnitz shepherds), also known as "the crowned flower order on the Pegnitz," was one of the societies founded in Germany in the course of the 17th century for the purification and improvement of the German language, especially in the domain of poetry. Georg Philipp Harndörffer and Johann Klaj instituted the order in Nuremberg in 1644, and named it after the river. Its emblem was the passion flower with Pan's pipes, and the motto *Mit Nutzen erfreulich, or Alle zu einem Ton einstimming*. The members set themselves the task of counteracting the pedantry of another school of poetry by imagination and gaiety, but lacking imagination and broad views they took refuge in allegorical subjects and puerile trifling. The result was to debase rather than to raise the standard of poetic art in Germany. At first the meetings of the order were held in private grounds, but in 1681 they were transferred to a forest near Kraftshof and Naunhof. In 1794 the order was reorganized, and it now exists merely as a literary society.

See Tittman, *Die närberth Dichterschule* (Göttingen, 1847); and the *Pestschrift zur 250-jährigen Jubelfeier des pegnetischen Blumenordens* (Nuremberg, 1894).

PEGOLOTTI, FRANCESCO BALDUCCI (fl. 1315-1340), Florentine merchant and writer, was a factor in the service of the mercantile house of the Bardi, and in this capacity we find him at Antwerp from 1315 (or earlier) to 1317; in London in 1317 and apparently for some time after; in Cyprus from 1324 to 1327, and again (or perhaps in unbroken continuation of his former engagements) in 1335. In this last year he obtained from the king of Little Armenia (i.e. medieval Cilicia, &c.) a grant of privileges for Florentine trade. Between 1335 and 1343, probably in 1330-1340, he compiled his *Libro di divisamenti di paesi e di misuri di mercatanzie e d'altre cose bisognolevi di sopra a' mercatanti*, commonly known as the *Pratica della mercatura* (the name given it by Pagnini). Beginning with a sort of glossary of foreign terms then in use for all kinds of taxes or payments on merchandise as well as for "every kind of place where goods might be bought or sold in cities," the *Pratica* next describes some of the chief trade routes of the 14th century, and many of the principal markets then known to Italian merchants; the imports and exports of various important commercial regions; the business customs prevalent in each of those regions; and the comparative value of the leading moneys, weights and measures. The most distant and extensive trade routes described by Pegolotti are: (1) that from Tana or Azov to Peking, via Arkhčan, Khiva, Otrar, Kuldja and Kashgar (Gittarchan, Organí, Ottrarre, Armelecco and Camíno in the *Pratica*); (2) that from Lajazzo on the Cilician coast to Tabriz in north Persia via Sivas, Erzinger and Erzerum (Salvastro, Arzanga and Arzeront); (3) that from Trebizond to Tabriz. Among the markets enumerated are: Tana, Constantinople, Alexandria, Damietta, and the ports of Cyprus and the Crimea. Pegolotti's notices of ports on the north of the Black Sea are very valuable; his works show us that Florentine exports had now gained a high reputation in the Levant. In other chapters an account is given of 14th-century methods of packing goods (ch. 29); of assaying gold and silver (ch. 35); of shipment; of "London in England in itself" (ch. 62); of monasteries in Scotland and England ("Scotland of England," *Scòzia di Inghilterre*) that were rich in wool (ch. 65). Among the latter are Newbattle, Balmerino, Gupar, Dunfermline, Dundrennan, Glenluce, Coldingham, Kelso, Newminster near Morpeth, Furness, Fountains, Kirkstall, Kirstead, Swineshead, Sawley.
and Calder. Pegolotti's interest in England and Scotland is chiefly connected with the wool trade.

There is only one MS. of the Pratica, viz. No. 2441 in the Riccardian Library at Florence (216 fol., occupying the whole volume), written in 1471; and one edition of the text, in vol. iii. of Gian Francesco Pagnini's Della Divina e delle altre gravi cose imposte dal comm. (1568). The first English publication was in 1834. Sir Henry Yule, Cathay, ii. 275-308, translated into English the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt Society, 1886). See also W. Heyd, Commerce de la Chine, iii. 50, 58, 78-79, 85-86, 112-119 (Leipzig, 1886); H. Kiepert, in Stichtingsberichten der philos.-hist. Cl. der berliner Akad., p. 901, &c. (Berlin, 1881); C. R. Beazley, Dawn of Modern Geography, iii. 322-332, 530, 555 (Oxford, 1906).

PEGU, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1901), 14,132. It is still surrounded by the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shew-maw-daw pagoda, 324 ft. high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital of the Talangas; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 16th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4,276 sq. m.; pop. (1901), 339,572, showing an increase of 441% in the decade. Christians numbered nearly 9,000, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 m., with locks.

The division of Pegu comprises the five districts of Rangoon county, Hanthawaddy, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area 13,084 sq. m.; pop. (1901), 1,820,638.

Pegu has also given its name to the Pegu Yoma, a range of hills running north and south for about 200 m., between the Irrawaddy and Sittang rivers. The height nowhere exceeds 2,000 ft. but the slopes are steep and rugged. The forests yield teak and other valuable timber. The Pegu river, which rises in this range, falls into the Rangoon river just below Rangoon city, into the sea about 13 m. below.

PEILE, JOHN (1838-1910). English philologist, was born at Whitehaven on the 24th of April 1838. He was educated at Repton and Christ's College, Cambridge. After a distinguished career (Craven scholar, senior classic and chancellor's medallist), he became fellow and tutor of his college, reader of comparative philology in the university (1884-1891), and in 1887 was elected master of Christ's. He took a great interest in the higher education of women and became president of Newnham College. He was the first to introduce the great philological works of George Curtius and Wilhelm Corson to the English student in his Introduction to Greek and Latin Etymology (1869). He died at Cambridge on the 9th of October 1910, leaving practically completed his exhaustive history of Christ's College.

PEINE, a town of Germany, in the Prussian province of Hanover, 16 m. by rail N.W. of Brunswick, on the railway to Hanover and Hamburg. Pop. (1905), 15,421. The town has a Roman Catholic and a Protestant church and several schools. Its industries include iron and steel works, breweries, distilleries and brickyards, and the manufacture of starch, sugar, malt, machinery and artificial manure. There are also large horse and cattle markets held here. Peine was at one time a strongly fortified place, and until 1803 belonged to the bishopric of Hildesheim.

PEINE PORTE ET DURE (French for "hard and severe punishment"); the term for a barbarous torture inflicted on those who, arraigned of felony, refused to plead and stood silent, or challenged more than twenty jurors, which was deemed a conformity equivalent to a refusal to plead. By early English law a prisoner, before he could be tried, must plead "guilty" or "not guilty." Before the 13th century it was usual to imprison and starve till submission, but in Henry IV's reign the peine was employed. The prisoner was stretched on his back, and stone or iron weights were placed on him till he either submitted or was pressed to death. Pressing to death was abolished in 1772; "standing mute" on an arraignment of felony being then made equivalent to conviction. By an act of 1828 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that is the rule to-day. An alternative to the peine was the tying of the thumbs tightly together with whipcord until pain forced the prisoner to speak. This was said to be a common practice at the Old Bailey up to the 19th century.

Among recorded instances of the infliction of the peine are: Juliana Quick (1448) for high treason in speaking derisively of Henry VI.; Margaret Clithower, "the martyr of York." (1586); Walter Calverly, of Calverly, Yorks. for the murder of his children (1565); and Major Strangways at Newgate, charged with murder of his brother-in-law (1657). In this last case it is said that upon the weights being placed in position several cavaliers friends of Strangways sprang on his body and put him out of his pain. In 1721 one Nathaniel Haves lay under a weight of 250 lb. for seven minutes, not without resistance. The peine was abolished by an act 1741 at Cambridge assizes, when a prisoner was so put to death; the penalty of thumb-tying having first been tried. In 1692 at Salem, Massachusetts, Giles Corey, accused of witchcraft, refusing to plead, was pressed to death. This is believed to be the only instance of the infliction of the penalty in America.

PEIPUS, or CHUDSKOE OZERO, a lake of north-west Russia, between the governments of St. Petersburg, Pskov, Livonia and Esthonia. Including its southern extension, sometimes known as Lake Peipus, it has an area of 1356 sq. m. Its shores are flat and sandy, and in part wooded; its waters deep, and they afford valuable fishing. The lake is fed by the Velikaya, which enters it at its southern extremity, and by the Embach, which flows in half way up its western shore; it drains into the Gulf of Finland by the Narova, which issues at its north-east corner.

PEIRAEUS, or PIRAEUS (Gr. Πειραιός), the port town of Athens, with which its history is inseparably connected. Pop. (1907), 67,982. It consists of a rocky promontory, containing three natural harbours, a large one on the north-west which is still one of the chief commercial harbours of the Levant, and two smaller ones on the east, which were used chiefly for naval purposes. Themistocles was the first to urge the Athenians to take advantage of these harbours, instead of using the sandy bay of Phaleron; and the fortification of the Peiraeus was begun in 467 B.C. It was again fortified by Themistocles, and by Long Walls in 460 B.C. The town of Peiraeus was laid out by the architect Hippodamus of Miletus, probably in the time of Pericles. The promontory itself consisted of two parts—the hill of Mynychia, and the projection of Acte; on the opposite side of the great harbour was the outwork of Eitoneia. The most stirring episode in the history of the Peiraeus is the seizure of Mynychia by Thrasybulus and the exiles from Phyle, and the consequent destruction of the "30 tyrants" in 404 B.C. The three chief arsenals of the Peiraeus were named Mynychia, Zea and Cantharus, and they contained galley slips for 82, 106 and 94 slips respectively in the 4th century B.C.

See under ATHENS. Also Angelopoulos, Πειραιών καλά τῶν ἀνδρῶν (Athens, 1808).

PEIRCE, BENJAMIN (1800-1889), American mathematician and astronomer, was born at Salem, Massachusetts, on the 4th of April 1800. Graduating at Harvard College in 1829, he became mathematical tutor there in 1831 and professor in 1833. He had already assisted Nathaniel Bowditch in his translation of the Mécanique céleste, and now produced a series of mathematical textbooks characterized by the brevity and terseness which made his teaching unattractive to inapt pupils. Young men of talent, on the contrary, found his instruction most stimulating, and after Bowditch's death in 1838 Peirce stood first among American mathematicians. His researches into the perturbations of Uranus and Neptune (Proc. Amer.
Acad., 1848) gave him a wider fame; he became in 1849 consulting astronomer to the American Nautical Almanac, and for this work prepared new tables of the moon (1852). A discussion of the equilibrium of Saturn's rings led him to conclude in 1855 that they must be of a fluid nature. From 1867 to 1874 he was superintendent of the Coast Survey. In 1857 he published his best known work, the System of Analytical Mechanics, which was, however, surpassed in brilliant originality by his Linear Associative Algebra (lithographed privately in a few copies, 1870; reprinted in the Amer. Journ. Math., 1882). He died at Cambridge, Mass., on the 6th of October 1880.

PEISANDER, of Camirus in Rhodes, Greek epic poet, supposed to have flourished about 640 B.C. He was the author of a Heracleia, in which he introduced a new conception of the hero, the lion's skin and club taking the place of the older Homeric equipment. He is also said to have fixed the number of the "labours of Hercules" at twelve. The work, according to Clement of Alexandria (Stromata, v. ch. 2) was simply a plagiarism from an unknown Pisinus of Lindus, enjoyed so high a reputation that the Alexandrian critics admitted the author to the epic canon. From an epigram (20) of Theocritus we learn that a statue was erected in honour of Peisander by his countrymen. He is to be distinguished from Peisander of Laranda in Lycia, who lived during the reign of Alexander Severus (A.D. 222-235), and wrote a poem on the mixed marriages of gods and mortals, after the manner of the Esiodi of Hesiod.

(See fragments in G. Kinkel, Epicorum graecorum fragmenta (1878); also F. G. Welcker, Kleine Schriften, vol. i. (1844), on the twelve labours of Hercules in Peisander.

PEISISTRATUS, (605? - 527 B.C.), Athenian statesman, was the son of Hippocrates. He was named after Peisistratus, the youngest son of Nestor, the alleged ancestor of his family; he was second cousin on his mother's side to Solon, and numbered among his ancestors Codrus the last great king of Athens. Thus among those who became "tyrants" in the Greek world he gained his position as one of the old nobility, like Phalaris of Agrigentum, and Lygdamis of Naxos; but unlike Orthogoras of Sicyon, who had previously been a cook. Peisistratus, though Solon's junior by thirty years, was his lifelong friend (though this is denied), nor did their friendship suffer owing to their political antagonisms. Peisistratus, who had already accepted the false statements of historians whose only authority was Aristotle's Constitution of Athens (ch. 17) carefully distinguishes Solon's Megarian War from a second in which Peisistratus was no doubt in command, undertaken between 570 and 565 to recapture Nisa (the port of Megara) which had apparently been recovered by the Megarians since Solon's victory (see Sandys on The Constitution of Athens, ch. 14, 1, note, and E. Abbott, History of Greece, vol. i. app. p. 544). Whatever be the true explanation of this problem, it is certain (1) that Peisistratus was regarded as a leading soldier, and (2) that his position was strengthened by the prestige of his family. Furthermore (3) he was a man of great ambition, persuasive eloquence and wide generosity; qualities which especially appealed at that time to the classes from whom he was to draw his support—hence the warning of Solon (Frag. II. B): "Fools, are you treading in the footsteps of the fox; can you not read the hidden meaning of these charming words?" Lastly, (4) and most important, the times were ripe for revolution. In the article on Solon (ad fin.), it is known that the Solon reforms, though they made a great advance in some directions, failed on the whole. They were too moderate to please the people, too democratic for the nobles. It was found that the government by Boule and Ecclesia did not mean popular control in the full sense; it meant government by the leisureed classes, inasmuch as the industrious farmer or herdman could not leave his work to give his vote at the hillmen, or do his duty as a councillor.Partly owing to this, and partly to ancient feuds whose origin we cannot trace, the Athenian people was split up into three great factions known as the Plain (Pedeis), led by Lycurgus and Miltiades, both of noble families; the Shore (Parali) led by the Alcmeonidae, represented at this time by Megacles, who was strong in his wealth and by his recent marriage with Argostrate, daughter of Cleisthenes of Sicyon; the Hill or Upland (Diacreis, Diacrie) led by Peisistratus, who no doubt owed his influence among these hillmen partly to the possession of large estates at Marathon. In the two former divisions the influence of wealth and birth predominated; the hillmen were poorly housed, poorly clad and unable to make use of the privileges which Solon had given them. Hence their attachment to Peisistratus, the "man of the people," who called upon them to sweep away the last barriers which separated rich and poor, nobles and commoners, city and countryside. Lastly, there was a class of men who were discontented with the Solonian constitution: some had lost by his Seisauchetha, others had vainly hoped for a general redistribution. These men saw their only hope in a revolution. Such were the factors which enabled him to found his tyranny.

To enter here into an exhaustive account of the various theories which even before, though especially after, the appearance of the Constitution of Athens have been propounded as to the chronology of the Peisistrata tyranny is impossible. For a summary of these hypotheses see J. E. Sandys's edition of the Constitution of Athens (p. 56, c. 14 note). The following is in brief the sequence of events: In 560 B.C. Peisistratus drove into the market-place, showed to an indignant assembly marks of violence on himself and his mules, and claimed to be the victim of assault at the hands of political enemies. The people unhesitatingly awarded their "champion" a bodyguard of fifty men (afterwards four hundred) armed with clubs. With this force he proceeded to make himself master of the Acropolis and tyrant of Athens. The Alcmeonidae fled and Peisistratus remained in power for about five years, during which Solon's death occurred. In 555 or 554 B.C. a coalition of the Plain and the Coast succeeded in expelling him. His property was confiscated and sold by auction, but in his absence the strife between the Plain and the Coast was renewed, and Megacles, unable to hold his own, invited him to return. The condition was that their families should be allowed by the marriage of Peisistratus to Megacles' daughter Coesya. A second coup d'etat was then effected. A beautiful woman, it is said, by name of Aspasia, endeared herself to Peisistratus and accompanied him to Athens at his side, while proclamations were made that the goddess herself was restoring Peisistratus to Athens. The ruse was successful, but Peisistratus soon quarrelled with Megacles over Coesya. By a former marriage he already had two sons, Hippias and Hipparchus, now growing up, and in his first tyranny or his first exile he married an Argive, Timonassa, by whom he had two other sons Iophon and Hegesistratus, the latter of whom is said to be identical with Theseus (Ath. Pol. c. 17), though from Thucydides and Herodotus we gather that they were distinct—e.g. Herodotus describes Hegesistratus as a bastard, and Thucydides says that Theseus was legitimate. Further it is suggested that Peisistratus was unwilling to have children by one on whom lay the curse of the Cyclonian outrage. The result was that in the seventh year (or month, see Ath. Pol. c. 15, 1, Sandys's note) Megacles accused him of neglecting his daughter, combined once more with the third faction, and drove the tyrant into an exile lasting apparently for ten or eleven years. During this period he lived first at Rheacles and later near Mt. Pangæus and on the Strymon collecting resources of money and men. He came finally to Eretria, and, with the help of the Theban exiles and Lygdamis of Naxos, whom he afterwards made ruler of that island, he passed over to Attica and defeated the Athenian forces at the battle of Pallenis or Pellenæ. From this time till his death he remained undisputed master of Athens. The Alcmeonidae were compelled to leave Athens, and from

1 It is suggested with probability that the Diacrii were rather the miners of the Laurium district (P. M. Ure, Journ. Hell. Stud., 1906, pp. 131-142).
the other noble families which remained he exacted 400 hostages whom he put in the care of his ally Lygdamis.

In the heyday of the Athenian democracy, citizens both conservative and progressive, politicians, philosophers and historians were unanimous in their denunciation of "tyranny." Yet there is no doubt that the rule of Peisistratus was most beneficial to Athens both in her foreign and in her internal relations. (1) During his enforced absence from Athens he had evidently acquired a far more extended idea of the future of Athens than had hitherto dawned on the somewhat parochial minds of her leaders. He was friendly with Thебes and Argos; his son Hegesistratus he set in power at Sigeum (see E. Abbott, Hist. of Gr. vol. i. xv. 9) and his friend Lygdamis at Naxos. From the mines of Thrace, and perhaps from the harbour dues and from the mines of Laurium, he derived a large revenue; under his encouragement, Miltiades had planted an Athenian colony on the shores of the Thracian Chersonese; he had even made friends with Thessaly and Macedonia, as is evidenced by the hospitality extended by them to Hippias on his final expulsion. Finally, he did not allow his friendliness with Argos to involve him in war with Sparta, towards whom he pursued a policy of moderation. (2) At home it is admitted by all authorities that he moderated and benefitted. He was careful to preserve at least the form of the established constitution. It is even said that, being accused of murder, he was ready to be tried by the Areopagus. Everything which he did during his third period of rule was in the interests of discipline and order. Thus he hired a mercenary bodyguard, and utilized for his own purposes the public revenues; he kept the chief magistrates (through which he ruled) in the hands of his family; he imposed a general tax of 10% (perhaps reduced by Hippias to 5%) on the produce of the land, and thus obtained control over the fleet and spread the burden of it over all the citizens (see the spurious letter of Peisistratus to Solon, Diog. Læ. i. 53; Thuc. vi. 54 and Arnold’s note ad loc.; Boeckh iii. 6; Thirlwall c. xi., pp. 72–74; and Grote). But the great wisdom of Peisistratus is shown most clearly in the skill with which he blinded the people to his absolutism. Pretending to maintain the Solonian constitution (as he could well afford), he realized that people would never recognize the deception if a sufficient degree of prosperity were ensured. Secondly, he knew that the greater the prosperity of the nation, the greater would be the difficulty that any who would interfere with the government should have in getting the people over power. Instead of this, he kept the country in considerable comfort, and the city in enjoyment of settled financial prosperity (see Constitution of Athens, c. 16, 7 ὁ ἐκ Κέρου Βίας).

The money which he accumulated he put to good use in the construction of roads and public buildings. Like Cleisthenes of Sicyon and Periander of Corinth, he realized that one great source of strength to the nobles had been their presidency over the local cults. This he diminished by increasing the splendour of the Panathenaic festival every fourth year, and the Dionysiac rites, and so created a national rather than a local religion. With the same idea he built the temple of the Pythian Apollo and began, though he did not finish, the temple of Zeus (the magnificent columns now standing belong to the age of Hadrian).

It should be noted as against this, the general account, that Thucydides, speaking apparently with accuracy, describes the tax as διστερ (5%); the Constitution of Athens speaks of the (familiar) διστερί (10%).

Dionysus, as the god of the rustics, was especially worshipped at Icaria, near Marathon, and so was the god of the Dacri. It seems likely that Peisistratus, to please his supporters, originated the City-Dionysia.

To him are ascribed also the original Parthenon on the Acropolis, afterwards burned by the Persians, and replaced by the Parthenon of Pericles. It is said that he gave a great impetus to the dramatic representations which belonged to the Dionysiac cult, and that it was under his encouragement that Thespis of Icaria, by impersonating character, laid the foundation of the great Greek drama of the 5th and 4th centuries. Lastly, Peisistratus carried out the purification of Delos, the sacred island of Apollo of the Ionians; all the tombs were removed from the neighbourhood of the shrine, the abode of the god of light and joy.

We have spoken of his services to the state, to the poor, to religion. It remains to mention his alleged services to literature. All we can reasonably believe is that he gave encouragement to poetry as he had done to architecture and the drama; Onomacritus, the chief of the Orphic succession, and collector of the oracles of Musaeus, was a member of his household. Honestly, or to impress the people, Peisistratus made considerable use of oracles (e.g. at the battle of Pellene), and his descendants, by the oracles of Onomacritus, persuaded Darius to undertake their restoration. As to the library of Peisistratus, we have no evidence that he constructed it neither can we consider it a work of the Comedius writer. There is strong reason for believing the story that he first collected the Homeric poems and that his was the text which ultimately prevailed (see Homer). It appears that Peisistratus was benevolent to the last, and, like Julius Caesar, showed no resentment against enemies and calumniators. What Solon said of him in his youth was true throughout, “there is no better-disposed man in Athens, save for his ambition.” He was succeeded by his sons Hippias and Hipparchus, by whom the tyranny was in various ways brought into disrepute.

It should be observed that the tyranny of Peisistratus is one of the many epochs of Greek history on which opinion has almost entirely changed since the age of Grote. Shortly, his services to Greece and to the world may be summed up under three heads: In foreign policy, he sketched out the plan on which Athens was to act in her external relations. He advocated (a) alliances with Argos, Thessaly and Macedonia, (b) ascendency in the Aegean (Naxos and Delos), (c) control of the Hellespontine route (Sigeum and the Chersonese), (d) control of the Strymon valley (Mt Pangaes and the Strymon). Further, his rule exemplifies what is characteristic of all the Greek tyrannies—the advantage which the ancient monarchy had over the republican form of government. By means of his sons and his deputies (or viceroys) and by his system of matrimonial alliances he gave Athens a widespread influence in the centres of commerce, and brought her into connexion with the growing sources of trade and production in the eastern parts of the Greek world. (2) His importance in the sphere of domestic policy has been frequently underrated. It may fairly be held that the reforms of Solon would have been futile had they not been fulfilled and amplified by the genius of Peisistratus. (3) It was under his auspices that Athens began to take the lead in literature. From this period we must date the beginning of Athenian literary ascendency. But see Athens.

60

PEKIN,

a city and the county-seat of Tazewell county, Illinois, U.S.A., on the Illinois river, in the central part of the state, about 11 miles S. of Peoria, and about 56 miles N. of Springfield. Pop. (1910), 9697. It is served by the Atchison, Topeka & Santa Fé, the Chicago & Alton, the Chicago, Peoria & St Louis, the Illinois Central, the Cleveland, Cincinnati, Chicago & St Louis, the Peoria Railway Terminal Company, the

(J. M. M.)
& Pekin Union and (for freight between Peoria and Pekin) the Illinois Valley Belt railways. Situated in a rich agricultural region and in the Illinois coalfields, Pekin is a shipping point and grain market of considerable importance, and has various manufactures. The value of the factory products in 1905 was $1,121,130. Pekin was first settled about 1830, was incorporated in 1830, and re-incorporated in 1874.

**PEKING,** or **Pekin,** the capital of the Chinese Empire, situated in 39° 57' N. and 116° 26' E., on the northern extremity of the great alluvial delta which extends southward from its walls for 700 m. For nine centuries Peking, under various names and under the dominion of successive dynasties, has, with some short intervals, remained an imperial city. Its situation near the northern frontier recommended it to the Tatar invaders as a convenient centre for their power, and its peculiarly fortunate position as regards the supernatural terrestrial influences pertaining to it has inclined succeeding Chinese monarchs to accept it as the seat of their courts. In 896 it was taken by an invading force of Khitan Tatars, who adopted it as their headquarters and named it Nanking, or the "southern capital." During the early part of the 12th century the Chinese recaptured it and restored it to its position as the capital. Song Hsiang was a grandson of a Chinese city of the first grade, and called it Yen-shan Fu. In 1153 it fell into the hands of the Kin Tatars, who made it a royal residence under the name of Chung-tu, or "central capital." Less than a century later it became the prize of Jenghiz Khan, who, having his main interests centred on the Mongolian steppes, declined to move his court southwards. His great successor, Kublai Khan (1280-1294), rebuilt the town, which he called Yenking, and which became known in Chinese as Ta-tu, or "great court," and in Mongolian as Khanbalik (Cambaluc), or "city of the khan." During the reign of the first emperor of the dynasty (1268-1399) which succeeded that founded by Jenghiz Khan the court resided at the modern Nanking, but the succeeding sovereign Yung-lo (1403-1425) transferred his court to Pe-king (i.e., "north-court"), which has ever since been the seat of government. For further history see **Cambaluc.**

During the periods above mentioned the extent and boundaries of the city varied considerably. Under the Kin dynasty the walls extended to the south-west of the Tatar portion of the present city, and the foundations of the northern ramparts of the Khan-balik of Kublai Khan are still to be traced at a distance of about 2 m. north beyond the existing walls. The modern city consists of the nei chi-ch'eng, or inner city, commonly known to foreigners as the "Tatar city," and the wai chi-ch'eng, or outer city, known in the same way as the "Chinese city." These names are somewhat misleading, as the inner city is not enclosed within the outer city, but adjoins its northern wall, which, being longer than the nei chi-ch'eng is wide, outflanks it considerably at both ends. The outer walls of the double city contain an area of about 25 sq. m., and measure 30 m. in circumference. Unlike the walls of most Chinese cities, those of Peking are kept in perfect order. Those of the Tatar portion, which is the oldest part of the city, are 50 ft. high, with a width of 60 ft. at the base and 40 ft. at the top, while those of the Chinese city, which were built by the emperor Kia-ting in 1543, measure 30 ft. in height, and have a width of 25 ft. at the base and 15 ft. at the top. The terre-plein is well and smoothly paved, and is defended by a crenellated parapet. The outer faces of the walls are strengthened by square buttresses built out at intervals of 60 yds., and on the summits of these stand the guard-houses for the troops on duty. Each of the sixteen gates of the city is protected by a semi-circular enceinte, and is surmounted by a high tower built in galleries and provided with countless loopholes.

Peking suffered severely during the Boxer movement and the siege of the legations in the summer of 1900. Not only were most of the foreign buildings destroyed, but also a large number of important Chinese buildings in the vicinity of the foreign quarter, including the ancient Hanlin Yuan, the boards of war, rites, &c. Almost the whole of the business quarter, the wealthiest part of the Chinese city, was laid in ashes (see **China: History**).

The population of Peking is reckoned to be about 9,000,000, a number which is out of all proportion to the immense area enclosed within its walls. This disparity is partly accounted for by the facts that large spaces, notably in the Chinese city, are not built over, and that the grounds surrounding the imperial palace, private residences and temples are very extensive. One of such enclosures constitutes the British legation, and most of the other foreign legations are similarly, though not so sumptuously, lodged. Viewed from the walls Peking looks like a city of gardens. Few crowded neighbourhoods are visible, and the characteristic features of the scene which meets the eye are the upturned roofs of temples, palaces, and mansions, gay with blue, green and yellow glazed tiles, glittering among the groves of trees with which the city abounds. It is fortunate that the city is not close-built or crowded, for since the first advent of foreigners in Peking in 1860 nothing whatever had been done until 1900 to improve the streets or the drainage. The streets as originally laid out were wide and spacious, but being unpaved and undrained they were no better than mud tracks diversified by piles of garbage and foul-smelling stagnant pools. Such drainage as had at one time existed was allowed to get choked up, giving rise to the smell characteristic of Chinese cities. An attempt has been made to improve matters by repaving one of the principal thoroughfares, but it will be the labour of a Hercules to cleanse this vast city from the accumulated filth of ages of neglect.

Enclosed within the Tatar city is the Huang ch'eng, or "Imperial city," which in its turn encloses the Tsse-kin ch'eng, or "Forbidden city," in which stands the emperor's palace. On the north of the Tsse-kin ch'eng, and separated from it by a moat, is an artificial mound known as the King shan, or "Prospect Hill." This mound, which forms a prominent object in the view over the city, is about 15 ft. high, and is topped with five summits, on each of which stands a temple. It is encircled by a wall measuring upwards of a mile in circumference, and is prettily planted with trees, on one of which the last emperor of the Ming dynasty (1644), finding escape from the Manchu invaders impossible, hanged himself. On the west of Prospect Hill is the Si ywan, or "Western Park," which forms part of the palace grounds. This park is tastefully laid out, and is traversed by a lake, which is mainly noticeable from the remarkable ably handsome marble bridge which crosses it from east to west. Directly northwards from Prospect Hill stands the residence of the T'it'u, or "governor of the city," and the Bell and the Drum Towers, both of which have attained celebrity from the nature of their contents—the first from the huge bell which hangs in it, and the second from the ornaments it contains for marking the time. The bell is one of five which the emperor Yung-lo ordered to be cast. In common with the others, it weighs 120,000 lb., is 14 ft. high, 34 ft. in circumference at the rim, and 9 in. thick. It is struck by a wooden beam swung on the outside, and only at the changes of the night-watch, when its deep tone may be heard in all parts of the city. In the Drum Tower incense-sticks, specially prepared by the astronomical board, are kept burning to mark the passage of time, in which important duty their accuracy is checked by a clock. Another of Yung-lo's bells is hung in a Buddhist temple outside the north-west angle of the city wall, and is covered both on the inside and outside with the Chinese texts of the Lankavatara Sutra, and the **Saddharma pundarika Sutra.**

Turning southwards we come again to the Forbidden City, the central portion of which forms the imperial palace, where, in halls which for the magnificence of their proportions and barbaric splendour are probably not to be surpassed anywhere, the Son of Heaven holds his court. In the eastern and western portions of this city are situated the residences of the highest dignitaries of the empire; while beyond its confines on the south stand the offices of the six official boards which direct the affairs of the eighteen provinces. It was in the "yamên" of one of these boards—the Li Pu or board of rites—that Lord Elgin signed the treaty at the conclusion of the war in 1860—an event which derives especial interest from the fact of its having been the first
PELAGIA, ST.—PELAGIUS (POPES)

occasion on which a European plenipotentiary ever entered Peking accompanied by all the pomp and circumstance of his rank.

Outside the Forbidden City the most noteworthy building is the Temple of Heaven, which stands in the outer or Chinese city. Here at early morning on the 21st of December the emperor offers sacrifice on an open altar to Shang-ti, and at periods of drought or famine presents prayers for relief to the same supreme deity. The altar at which these solemn rites are performed consists of a triple circular marble terrace, 210 ft. wide at the base, 150 in the middle and 90 at the top. The uppermost surface is paved with blocks of the same material forming nine concentric circles, the innermost consisting of nine blocks, and that on the outside of eighty-one blocks. On the central stone, which is a perfect circle, the emperor kneels. In the same temple stands the altar of prayer for good harvests, which is surmounted by a triple-roofed circular structure 90 ft. in height. The tiles of these roofs are glazed porcelain of the most exquisite deep-blue colour, and add a conspicuous element of splendour to the shrine.

The other powers of nature have shrines dedicated to them in the same order. To the north of the city, the altars to the Sun and Moon outside the north-eastern and north-western angles respectively of the Chinese city, and the altar of agriculture inside the south gate of the Chinese city. Next to these in religious importance comes the Confucian temple, known as the Kuo-tze-kien. Here there is no splendour; everything is quite plain; and one hall contains all that is sacred in the building. There the tablets of the "soul of the most holy ancestral teacher, Confucius," and of his ten principal disciples stand as objects of worship for their countless followers. In one courtyard of this temple are deposited the celebrated ten stone drums which bear poetical inscriptions commemorative of the hunting expeditions of King Kuan (827-781 B.C.), in whose reign they are believed, though erroneously, to have been cut; and in another stands a series of stone tablets on which are inscribed the names of all those who have obtained the highest literary degree of Tsin-shi for the last five centuries.

In the south-eastern portion of the Tatar city used to stand the observatory, which was built by order of Kublai Khan in 1296. During the period of the Jesuit ascendency in the reign of K'ang-hi (1661-1721), the superintendence of this institution was confided to Roman Catholic missionaries, under whose guidance the bronze instruments formerly existing were constructed. The inhabitants of Peking being consumers only, and in no way producers, the trade of the city is very small, though the city is open to foreign commerce. In 1897 a railway was opened between Tientsin and Peking. This was only effected after great opposition from the ultra-Conservatives, but once accomplished the facilities were gladly accepted by all classes, and the traffic both in goods and passengers is already enormous. Out of deference to the scruples of the ultra-Conservatives, the terminus was fixed at a place called Lu-Kou-ch'iao, some 4 m. outside the walls, but this distance has since been covered by an electric tramway. The trunk line constructed by the Franco-Belgian syndicate connects Lu-Kou-ch'iao, the original terminus, with Hankow—hence the name Lu-Han by which this trunk line is generally spoken of, Lu being short for Lu-Kou and Han for Hankow.

PELAGIA, ST. An Antiochene saint of this name, a virgin of fifteen years, who chose death by a leap from the house-top rather than dishonour, is mentioned by Ambrose (De virg. iii. 7, 33; Ep. xxxvii. ad Simpl.,) and is the subject of two sermons by Chrysostom. Her festival was celebrated on the 8th of October (Wright's Syriac Martyrology). In the Greek synaxaria the same day is assigned to two other saints of the name of Pelagia—one, also of Antioch, and sometimes called Margaret and also "the sinner"; the other, known as Pelagia of Tarsus, in Cilicia. The legend of the former of these two is famous. She was a celebrated dancer and courtesan, who, in the full flower of her beauty and guilty sovereignty over the youth of Antioch, was suddenly converted by the influence of the holy bishop Nonnus, whom she had heard preaching in front of a church which she was passing with her gay train of attendants and admirers. Seeking out Nonnus, she overcame his canonical scruples by her tears of genuine penitence, was baptized, and, disguising herself in the garb of a male penitent, retired to a grotto on the Mount of Olives, where she died after three years of strict penance. This story seems to combine with the name of the older Pelagia some traits from an actual history referred to by Chrysostom (Hom. in Matth. lvii. 3). In associating St Pelagia with St Marina, St Margaret (q.e.), and others, of whom either the name or the legend recalls Pelagia, Hermann Usener has endeavoured to show by a series of subtle deductions that this saint is only a Christian travesty of Aphrodite. But the name was a part of the first Pelagia of Antioch, the Pelagia of Ambrose and Chrysostom. These names have subsequently become connected with her name are the result of a very common development in literary history.

der heiligen Pelagia (Bonn, 1879); H. Delehaye, The Legends of the Saints (London, 1907), pp. 197-205.

PELAGIUS, the name of two popes.

PELAGIUS I., pope from 555 to 561, was a Roman by birth, and first appears in history at Constantinople in the rank of deacon, and as apocrisiarius of Pope Silverius, whose overthrow in favour of Vigilius his intrigues promoted. Vigilius continued him in his diplomatic appointment, and he was sent by the emperor Justinian in 542 to Antioch on ecclesiastical business; he afterwards took part in the synod at Gaza which deposed Paul of Alexandria. He had amassed some wealth, which on his return to Rome he so employed among the poor as to secure for himself great popularity; and, when Vigilius was summoned to Byzantium in 544, Pelagius, now archdeacon, was left behind as his vicar, and by his tact in dealing with Totila, the Gothic invader, saved the citizens from massacre and outrage. He appears to have followed his master to Constantinople, and to have taken part in the Three Chapters controversy; in 553, at all events, he signed the "constitutum" of Vigilius in favour of these, and for refusing, with him, to accept the decrees of the fifth general council (the 2nd of Constantinople, 553) shared his exile. Even after Vigilius had approved the condemnation of the Three Chapters, Pelagius defended them, and even published a book on the subject. But when Vigilius died (June 7, 555), he accepted the council, and allowed himself to be designated by Justinian to succeed the late pope. It was in these circumstances that he returned to Rome; but most of the clergy, suspecting his orthodoxy, and believing him to have had some share in the removal of his predecessor, shunned his fellowship. He enjoyed, however, the support of Narses, and, after he had publicly purged himself of complicity in Vigilius's death in the church of St Peter, he met with toleration in his own immediate diocese. The rest of the western bishops, however, still held aloof, and the episcopate of Tuscany caused his name to be removed from the diptychs. This elicited from him a circular, in which he asserted his loyalty to the four general councils, and declared that the hostile bishops had been guilty of schism. The bishops of Liguria and Aemilia, headed by the archbishop of Milan, and those of Istria and Venice, headed by Paulinus of Aquileia, also withheld their fellowship; but Narses resisted the appeals of Pelagius, who would have invoked the secular arm. Chilldebert, king of the Franks, also refused to interfere. Pelagius died on the 4th of March 561, and was succeeded by John III.

PELAGIUS II., a native of Rome, but of Gothic descent, was pope from 579 to 590, having been consecrated successor of Benedict I., without the sanction of the emperor, on the 26th of
November. To make his apologies for this irregularity he sent Deacon Gregory, who afterwards became Pope Gregory the Great, as his apocrygusi to Constantinople. In 485 he sought to heal the schism which had subsisted since the time of Pelagius I. in connexion with the Three Chapters, but his efforts were without success. In 588 John, patriarch of Constantinople, by reviving the old and disputed claim to the title of oecumenic patriarch, elicited a vigorous protest from Pelagius; but the decretal which professes to convey the exact words of the document is now known to be false. He died in January 590, and was succeeded by Gregory I.

PELAGIUS (c. 360–c. 420), early British theologian. Of the origin of Pelagius almost nothing is known. The name is supposed to be a graecized form of the Cymric Morgan (sea-begotten). His contemporaries understood that he was of British (probably of Irish) birth, and gave him the appellation Brito. He was a large ponderous person, heavy both in body and mind (Jerome, "stolidissimus et Scotorum pulchrius praegravatus"). He was influenced by the monastic enthusiasm which had been kindled in Gaul by Athanasius (336), and which, through the influence of Martin of Tours (315), had been transmitted to Britain and the British provinces in France and Spain and had been transplanted itself to the Britons and Scots. For, though Pelagius remained a layman throughout his life, and though he never appears in any strict connexion with a coenobite fraternity, he yet adhered to monastic discipline ("veluti monachus") and distinguished himself by his purity of life and exceptional sanctity ("egregie Christianus"). He seems to have been one of the earliest, if not the very earliest, of that remarkable series of men who issued from the monasteries of Scotland and Ireland, and carried back to the Continent in a purified form the religion they had received from it. Coming to Rome in the beginning of the 6th century (his earliest known writing is of date 409), he found a scandalously low tone of morality prevalent. But his remonstrances were met by the plea of human weakness. To remove this plea by exhibiting the actual powers of human nature became his first object. It seemed to him that the Augustinian doctrine of total depravity and of the consequent bondage of the will both cut the sinew of all human effort and threw upon God the blame which really belonged to man. His favourite maxim was, "If I sought, I can."

The views of Pelagius did not originate in a conscious reaction against the influence of the Augustinian theology, although each of these systems was developed into its ultimate form by the opposition of the other. Neither must too much weight be allowed to the circumstance that Pelagius was a monk, for he was unquestionably alive to the delusive character of much that passed for monkish sanctity. Yet possibly his monastic training may have led him to look more at conduct than at character, and to believe that holiness could be arrived at by rigorous discipline. This view of things suited his matter-of-fact temperament. Judging from the general style of his writings, his religious development had been equable and peaceful, not marked by the prolonged mental conflict, or the abrupt transitions, which characterized the experience of his great opponent. With no single thought being dearer to him, and many of his practical counsels are marked by sagacity, and are expressed with the succinctness of a proverb ("corpus non frangendum, sed regendum est"). His interests were primarily ethical; hence his insistence on the freedom of the will and his limitation of the action of divine grace.

The peculiar tenets of Pelagius, though indicated in the commentaries which he published at Rome previous to 409, might not so speedily have attracted attention had they not been adopted by Coelestius, a much younger and bolder man than his teacher. Coelestius, probably an Italian, had been trained as a lawyer, but abandoned his profession for an ascetic life. When Rome was sacked by the Goths (410) the two friends crossed to Africa. There Pelagius once or twice met with Augustine, but very shortly sailed for Palestine, where he justly expected that his opinions would be more cordially received. Coelestius remained in Carthage with the view of receiving ordination. But Aurelius, bishop of Carthage, being warned against him, summoned him, at which Paulinus, a deacon of Milan, charged Coelestius with holding the following six errors: (1) that Adam would have died even if he had not sinned; (2) that the sin of Adam injured himself alone, not the human race; (3) that new-born children are in the same condition in which Adam was before the fall; (4) that the whole human race does not die because of Adam's death or sin, nor will the race rise again because of the resurrection of Christ; (5) that the law gives entrance to heaven as well as the gospel; (6) that even before the coming of Christ there were men who were entirely without sin. To these propositions a seventh is sometimes added, "that infants, though unbaptized, have eternal life," a corollary from the third. Coelestius did not deny that he held these opinions, but he maintained that they were open questions, on which the Church had never pronounced. The synod, notwithstanding, condemned and excommunicated him. Coelestius, after a futile appeal to Rome, went to Ephesus, and there received ordination.

In Palestine Pelagius lived unmolested and revered, until 415 Orusios, a Spanish priest, came from Augustine, who in the meantime had written his De peccatorum meritis, to warn Jerome against him. The result was that in June of that year Pelagius was cited by Jerome before John, bishop of Jerusalem, and charged with holding that man may be without sin, if only he desires it. This prosecution broke down, and in December of the same year Pelagius was summoned before a synod of fourteen bishops at Diospolis (Lydda). The prosecutors on this occasion were two deposed Gallican bishops, Heros of Arles and Lazarus of Aix, but on account of the illness of one of them neither could appear. The proceedings, being conducted in various languages and by means of interpreters, lacked certainty, and justified Jerome's application to the synod of the epithet "miserable." But there is no doubt that Pelagius repudiated the assertion of Coelestius, that "the divine grace and help is not granted to individual acts, but consists in free will, and in the giving of the law and instruction." At the same time he affirmed that a man is able, if he likes, to live without sin and keep the commandments of God, inasmuch as God gives him this ability. The synod was satisfied with these statements, and pronounced Pelagius to be in agreement with Catholic teaching. Pelagius naturally flung himself on his acquittal, and provoked Augustine to give a detailed account of the synod, in which he shows that the language used by Pelagius was ambiguous, but that, being interpreted by his previous written statements, it involved a denial of what the Church understood by grace and by man's dependence on it. The North African Church as a whole resisted the decisions of Diospolis, and in 416 sent up from their synods of Carthage and Mileve (in Numidia) an appeal to Innocent, bishop of Rome, who, flattered by the tribute thus paid to the see of Rome, decided the question in favour of the African synods. And, though his successor Zosimus wavered for some time, he at length fell in with what he saw to be the general mind of both the ecclesiastical and the civil powers. For, simultaneously with the largely attended African synod which finally condemned Pelagianism in the West, an imperial edict was issued at Ravenna by Honorius on the 30th of April 418, peremptorily determining the theological question and enacting that not only Pelagius and Coelestius but all who accepted their opinions should suffer confiscation of goods and irrevocable banishment. Thus prompted, Zosimus drew up a circular inviting all the bishops of Christendom to subscribe a condemnation of Pelagian opinions. Nineteen Italian bishops refused, among them Julian of Eclanum in Apulia, a man of good birth, approved sanctity and great capacity, who now became the recognized leader of the movement. But not even his acuteness and zeal could redeem a cause which was rendered hopeless when the Eastern Church (Ephesus, 431) confirmed the decision of the West. Pelagius himself disappears after 420; Coelestius was at Constantinople seeking the aid of Nestorius in 428.

**Pelagianism.**—The system of Pelagius is a consistent whole, each part involving the existence of every other. Starting from the idea that "ability limits obligation," and resolved that men...
should feel their responsibility, he insisted that man is able to do all that God commands, and that there is, and can be, no sin where the will is not absolutely free—able to choose good or evil. The favourite Pelagian formula, “Sì necessitatis est, peccatum non est; sì voluit, potebat; sì non voluit, non potuit,” is purely based on the assumption that the will is free. Pelagianism is thus fundamentally founded on the theory that the will is subject to personal desires, which we regard as immoral, but which are not sins because they are not imputed upon the will itself. Thus, in the Pelagian theory, the will is free, and hence there is no sin, even though it is often impossible to choose between good and evil. But, when we consider the nature of the Pelagian view of the will, we see that it is not only a theory of free will, but also a theory of human nature. For Pelagius himself did not carry his rationalism through to its issues; but the logical consequence of his system was, as Augustine perceived, the denial of the atonement and other central truths of the Christian religion. And Augustine was supported in his stand against Pelagianism by the undeniable fact that no Pelagian could escape the argument against his position that Pelagius' fundamental principle was the dictum “sì necessitatis est, peccatum non est.”

The anthropology of Pelagianism was essentially naturalistic. It threatened to supersede grace by nature, to deny all immediate necessity to the grace of God, and to make the actualisation of the will's potentialities the only theme of the Church's teaching. Pelagius himself did not carry his rationalism through to its issues; but the logical consequence of his system was, as Augustine perceived, the denial of the atonement and other central truths of the Christian religion. And Augustine was supported in his stand against Pelagianism by the undeniable fact that no Pelagian could escape the argument against his position that Pelagius' fundamental principle was the dictum “sì necessitatis est, peccatum non est.”
fidei ad Innocentium et Epistolae ad Demetrium are preserved in Jerome’s works (vol. v. of Martiani’s ed., vol. xi. of Vallarsi’s). The last-named was also published separately by Scmoller (Halle, 1775). There are of course many citations in the Anti-Pelagian Treatises of St. Augustine (Augustine, Tractates 32 in vol. i., tr. and ed. by R. Emmerling, Antwerp, 1810); J. L. Jacoby, Die Lehre des Pelagius (Leipzig, 1842); F. Klasen, Die innere Entwicklung des Pelagianismus (Freiburg, 1882); B. B. Warfield, Two Studies in the History of Doctrine (New York, 1905); and Engli, History of Dogma, 3rd English ed. (London, 1905). For an account of all the principal works on Pelagianism, see v. 1602-7 of F. Loetsch, Dogmensgeschichte und Artz in Hauck-Herzog’s Real-enzyklo. für prot. Theologie u. Kirche (end of vol. xv.), where a full bibliography is given.

(M. D.)

PELAGIANS, a name applied by Greek writers to a prehistorian people whose traces were believed to exist in Greek lands. If the statements of ancient authorities are marshalled in order of their date it will be seen that certain beliefs cannot be traced back beyond the age of this or that author. Though this does not prove that the beliefs themselves were not held earlier, it suggests caution in assuming that they were. In the Homeric poems there are Pelagians among the allies of Troy: in the catalogue, Iliad, ii. 840-843, which is otherwise in strict geographical order, they stand between the Hellespontine towns and the Thracians of south-east Europe, i.e. on the Hellespontine border of Thrace. Their town or district is called Larissa and is fertile, and they are celebrated for their spearmanship. Their chiefs are Hippothus and Pylaos, sons of Lethus son of Teutamus. Iliad, x. 428-429, describes their camping ground between the town of Troy and the sea; but this obviously proves nothing about their habitat in time of peace. Odyssey, xvii. 175-177, notes Pelagians in Crete, together with two apparently Pelasgic and two immigrant peoples (Achaean and Dorian), but gives no indication to which class the Pelagians belong. In Lemnos (Iliad, vii. 467; xiv. 230) there are no Pelagians, but a Mynian dynasty. Two other passages (Iliad, ii. 681-684; xvi. 233-235) apply the epithet “Pelagic” to a district called Argos about Mt Othrys in south Thessaly, and to Zeus of Dodona. But in neither case are actual Pelagians mentioned; the Thessalian Argos is the specific home of Hellenes and Achaeans, and Dodona is inhabited by Perrhaebians and Aemines (Iliad, ii. 750) who are nowhere described as Pelagian. It looks therefore as if “Pelagian” were here used connotatively, to mean either “formerly occupied by Pelagian” or simply “of immemorial age.”

Hesiod expands the Homeric phrase and calls Dodon “a seat of Pelagi”; he speaks also of a person called Pelagius as father of Lycaon, the culture-hero of Arcadia; and the epic poet, Asis, describes Pelagus as the first man, whom the earth threw up that there might be a race of men. Hecataeus makes Pelagus king of Thessaly (expounding Iliad, ii. 681-684); Acusilaus applies this Homeric mention to the Peloponnesian Argos, and engrafts the Hesiodic Pelagus, father of Lycaon, into a Peloponnesian genealogy. Helenianus a generation later repeats this blunder, and identifies this Argive and Arcadian Pelagus with the Thessalian Pelagus of Hecataeus. For Achilles (Supplices 1, sq.) Pelagus is earthborn, as in Asis, and rules a kingdom stretching from Argos to Dodona and the Strymon; but in Prometheus 875, the “Pelagian” land simply means Argos. Sophocles takes the same view (Inachus, fr. 256) and for the first time introduces the word “Tyrrhenian” into the story, apparently synonymous with Pelagian.

Herodotus, like Homer, has a denotative as well as a connotative use. He describes actual Pelagians surviving and mutually intelligible (a) at Place and Scylace on the Asiatic shore of the Hellespont, and (b) near Crestone on the Strymon; in the latter area they have “Tyrrhenian” neighbours. He alludes to other districts where Pelagian peoples lived on under changed names; Samothrace and Andantis in Troas are probably instances of this. In Lemnos and Imbros he describes a Pelagian population who were conquered by Athens shortly before 500 B.C.; and in this connexion he tells a story of earlier raids of these Pelagians on Attica, and of a temporary settlement there of Hellespontine Pelagians, all dating from a time “when the Athenians were first beginning to count as Greeks.” Elsewhere “Pelagian” is used by Herodotus as anything typical of, or surviving from, the state of things in Greece before the coming of the Hellenes. In this sense all Greece was once “Pelagic”; the clearest instances of Pelagian survival in ritual and customs and antiquities are in Arcadia, the “Ionian” districts of north-west Peloponnese, and Attica, which have suffered least from hellenization. In Athens itself the prehistoric wall of the citadel and a plot of ground close below it were venerated in the 5th century as “Pelagian”; so too Thucydides (ii. 17). We may note that all Herodotean examples of actual Pelagi lie round, or near, the actual Pelagi of Hомерic Thrace; that the most distant of these is confirmed by the testimony of Thucydides (iv. 106) as to the Pelagian and Tyrrhenian population of the adjacent seaboard: also that Thucydides adopts the same general Pelagian theory of early Greece, with the refinement that he regards the Pelagian name as originally specific, and as having come gradually into this generic use.

Ephorus, relying on Hesiodic tradition of an aboriginal Pelagian type in Arcadia, elaborated a theory of the Pelagians as a warrior people spreading (like “Aryans”) from a “Pelagian home,” and annexing and colonizing all the parts of Greece where earlier writers had found allusions to them, from Dodona to Crete and the Troad, and even as far as Italy, where again their settlements had been recognized as early as the time of Hellenicus, in close connexion once more with “Tyrrhenians.”

The copious additional information given by later writers is all by way either of interpretation of local legends in the light of Ephorus’s theory, or of explanation of the name “Pelagol,” when Ptolemy expands a popular etymology “stork-folk” (πελαγος—πελαγως) into a theory of their seasonal migrations; or Apollodorus says that Homer calls Zeus Pelagian “because he is not far from every one of us,” θεός γεν Πελαγος ἐστιν.

The connexion with Tyrrhenians which began with Hellenicus, Herodotus and Sophocles becomes confused with them in the 3rd century, when the Lemnian pirates and their Attic kinsmen are plainly styled Tyrrhenians, and early fortress-walls in Italy (like those on the Palatine in Rome) are quoted as “Arcadian” colonies.

Modern writers have either been content to restate or amplify the view, ascribed above to Ephorus, that “Pelagian” simply means “prehistoric Greek,” or have used the name Pelagian at their pleasure to denote some one element in the mixed population of the Aegean—Thracian, Illyrian (Albanian) or Semitic. G. Sergi (Origine e diffusione della stirpe mediterranea in Roma, 1850; L. Scylaceus, The Mediterranean Race, London, 1901), followed by many anthropologists, describes as “Pelagian” one branch of the Mediterranean or Euro-African race of mankind, and one group of types of skull within that race. The character of the ancient citadel wall at Athens, already mentioned, has given the name “Pelagic masonry” to all constructions of large unhewn blocks fitted roughly together without mortar, from Asia Minor to Spain.

For another view than that here taken see Achaean; also GREECE: Ancient History, § 3, “Homeric Age.”

PELEUS, in Greek legend, king of the Myrmidons of Phthia in Thessaly, son of Aeacus, king of Aegina, and brother (or
intimate friend) of Telamon. The two brothers, jealous of the athletic prowess of their step-brother Phocus, slew him; but the crime was discovered, and Peleus and Telamon were banished. Peleus took refuge in Pthia with his uncle Eurytion, who purified him from the guilt of murder, and gave him his daughter Antigone to wife, and a third of the kingdom as her dowry. Having accidentally killed his father-in-law at the Calydonian boar-hunt, Peleus was again obliged to flee, this time to Iolcus, where he was purified by Acastus. The most famous event in the life of Peleus was his marriage with the sea-goddess Thetis, by whom he became the father of Achilles. The story ran that both Zeus and Poseidon had sought her hand, but, Themis (or Prometheus or Proteus) having warned the former that a son of Thetis by Zeus would prove mightier than his father, the gods decided to marry her to Peleus. Thetis, to escape a distasteful union, changed herself into various forms, but at last Peleus, by the instructions of Chiron, seized and held her fast till she resumed her original shape, and was unable to offer further resistance. The wedding (described in the fine Epithalamium of Catullus) took place in Chiron's cave on Mt. Pelion. Peleus survived both his son Achilles and his grandson Neoptolemus, and was carried away by Thetis to dwell for ever amongst the Nereids.

PELEW ISLANDS (Ger. Palauinseen, also Palao), a group of twenty-six islands in the western Pacific Ocean, between 2° 35' and 9° N., and 130° 4' and 134° 40' E., belonging to Germany. They lie within a coral barrier reef, and in the south the islands are of coral, but in the north of volcanic rocks. They are well wooded, the climate is healthy, and the water-supply good. A few rats and bats represent the indigenous mammals, but the sea is rich in fish and molluscs; and Dr Otto Finsch (Jour. des Museum Godfrej, 1875) enumerated 50 species of birds, of which 12 are peculiar to the group. The total area is 175 sq. m., the largest islands being Babeltop (Babelthup, Baobeltao and other variants), Urukapi (Urukhople), Koror, Nyaur, Peleliu and Eilmalk (Irakon). The population is about 3100. The natives are Micronesians, and are darker and shorter than their kinsmen, the Caroline Islanders. They usually have the frizzly hair of the Melanesians, and paint their bodies in brilliant colours, especially the women. The men vary in height from 5 ft. to 5 ft. 5 in., the women from 4 ft. 9 to 5 ft. 2 in. The skull shows a strong tendency to brachycephalism. Two curious customs may be noted—the institution of an honourable order bestowed by the king, called klili; and a species of mutual aid society, sometimes confined to women, and possessing considerable political influence. There are five kinds of currency in the islands, consisting of beads of glass and enamel, to which a supernatual origin is ascribed.

The islands were sighted in 1543 by Ruy Lopez de Villalobos, who named them the Arrecitos. The origin of the name Islas Palaos is doubtful. The islands were bought by Germany from Spain in 1899, and are administered together with the western Carolines, Yap being the administrative centre.

See K. Semper, Die Palau-Inseln (Leipzig, 1873); J. S. Kubary, Die sonstigen Einrichtungen der Palauan (Berlin, 1885); A. A. Marche, Louis et Palouan (Paris, 1887).

PELF, a term now chiefly used of money and always in a derogatory sense. The word originally meant plunder, pillage (O. Fr. pelfe, probably from Lat. pilare, to deprive of hair, pilum), and this significance is still kept in the related word "piller," to make petty thefts.

PELHAM, the name of an English family, derived from Pelham in Hertfordshire, which was owned by a certain Walter de Pelham under Edward I., and is alleged to have been in the possession of the same family before the Norman conquest. The family dignities included the barony of Pelham of Laughton (1706-1768), the earldom of Clare (1714-1768), the dukedom of Newcastle (1715-1768), the barony of Pelham of Stanmer from 1762, the earldom of Chichester from 1801 and the earldom of Yarborough from 1837.

JOHN DE PELHAM (1370) was one of the captors of John II. of France at Poitiers, acquired land at Winchelsea by his marriage with Joan Herbert, or Finch. His son, JOHN DE PELHAM (d. 1429), was attached to the party of John of Gaunt and his son Henry IV. In 1393 he received a life appointment as constable of Pevensey Castle, an honour subsequently extended to his heirs male, and he joined Henry on his invasion in 1399, if he did not actually land with him at Ravenspur. He was knighted at Henry's coronation, and represented Sussex in parliament repeatedly during the reign of Henry IV., and again in 1422 and 1427. As constable of Pevensey he had at different times the charge of Edward, duke of York, in 1405; Edmund, earl of March, with his brother Roger Mortimer in 1406; James I. of Scotland in 1414; Sir John Mortimer in 1422, and the queen dowager, Joan of Navarre, from 1418 to 1422. He was constantly employed in the defence of the southern ports against French invasion, and his powers were increased in 1407 by his appointment as chief butler of Chichester and of the Sussex ports, and in 1412 by the grant of the rape of Hastings. He became constable of England and Ireland, and although he was superseded on the accession of Henry V. he was sent in the next year to negotiate with the French court. He was included among the executors of the wills of Henry IV., of Thomas, duke of Clarence, and of Henry V. He died on the 12th of February 1429, and was succeeded by his son John, who took part in Henry V.'s expedition to Normandy in 1417.

In the reign of Queen Elizabeth Sir William Pelham (c. 1530-1587), third son of Sir William Pelham (d. 1538) of Laughton, Sussex, became lord justice of Ireland. He was captain of pioneers at the siege of Leith in 1560, and served at the siege of Havre in 1562, and with Coligny at Caen in 1563. He then returned to Havre, at that time occupied by English troops, and was one of the hostages for the fulfilment of its surrender to Charles IX. in 1564. After his return to England he fortified Berwick among other places, and was appointed lieutenant-general of ordnance. He was sent to Ireland in 1579, when he was knighted by Sir William Drury, the lord justice. Drury died in October, and Pelham was provisionally made his successor, an appointment subsequently confirmed by Elizabeth. Alarmed by the power and influence of Gerald Fitzgerald, 15th earl of Desmond, and brother John de Desmond, he proclaimed John an earl a traitor. Elizabeth protested strongly against Pelham's action, which was justified by the sack of Youghal by Desmond. Thomas Butler, 10th earl of Ormonde, was entrusted with the campaign in Munster, but Pelham joined him in February 1580, when it was believed that a Spanish descent was about to be made in the south-west. The English generals laid waste northern Kerry, and proceeded to besiege Carrigafoyle Castle, which they stormed, giving no quarter to man, woman or child. Other strongholds submitted on learning the fate of Carrigafoyle, and were garrisoned by Pelham, who hoped with the concourse of Admiral Winter's fleet to limit the struggle to Kerry. He vainly sought help from the gentry of the county, who sympathized with Desmond, and were only brought to submission by a series of "drives." After the arrival of the new deputy, Lord Grey of Wilton, Pelham returned to England on the ground of health. He had retained his office as lieutenant-general of ordnance, and was now made responsible for debts incurred during his absence. Leicester desired his services in the Netherlands, but it was only after much persuasion that Elizabeth set him free from the army by accepting a mortgage on his estates as security for his liabilities. The favour shown by Leicester to Pelham caused serious jealousies among the English officers, and occasioned a camp brawl in which Sir Edward Norris was injured. Pelham was wounded at Doeburg in 1586, and accompanied Leicester to England in 1587. Returning to the Netherlands in the same year he died at Flushing on the 24th of November 1587. His half-brother, Sir Edmund Pelham (d. 1606), chief baron of the exchequer in Ireland, was the first English judge to go on circuit in Ulster.
Sir William married Eleanor, daughter of Henry Neville, earl of Westmorland, and was the ancestor of the Pelhams of Brocklesby, Lincolnshire. In the fourth generation Charles Pelham died in 1763 without heirs, leaving his estates to his great-nephew Charles Anderson (1749–1823), who thereupon assumed the additional name of Pelham, and was created Baron Yarborough in 1794. His son Charles (1781–1846), who was for many years commodore of the Royal Yacht Squadron, was created earl of Yarborough and Baron Worsley in 1837. Charles Alfred Worsley, the 4th earl (b. 1850), exchanged the name of Anderson-Pelham for that of Pelham in 1905. He married in 1886 Marcia Lane-Fox, eldest daughter of the 12th Baron Conyers, who became in 1892 Baroness Conyers in her own right.

Sir Nicholas Pelham (1517–1606), an elder half-brother of Sir William Pelham, defended Seaforth against the French in 1545, and sat for Arundel and for Sussex in parliament. He was the ancestor of the earls of Chichester. His second son, Sir Thomas Pelham (d. 1624), was created a baronet in 1612. His descendant, Sir Thomas Pelham, 4th baronet (c. 1650–1712), represented successively East Grinstead, Lewes and Sussex in parliament, and was raised to the House of Lords as Baron Pelham of Laughton in 1706. By his second marriage with Grace (d. 1700), daughter of Gilbert Holles, 3rd earl of Clare, and sister of John Holles, duke of Newcastle, he had five daughters, and two sons—Thomas Pelham, earl of Clare, duke of Newcastle-on-Tyne and 1st duke of Newcastle-under-Lyme (see Newcastle, Dukes of), and Henry Pelham (q.v.). The duke of Newcastle died without heirs, and the dukedom of Newcastle-under-Lyme descended to his nephew, Henry Fiennes Clinton, afterwards known as Pelham-Clinton, and his heirs, but the barony of Pelham of Laughton became extinct. In 1762 Newcastle had been created Baron Pelham of Stanmer, with reversion to his cousin and heir-male, Thomas Pelham (1728–1805), who became commissioner of trade (1754), lord of the admiralty (1761–1764), comptroller of the household (1765–1774), 2nd lord of the treasury (1773–1805), chief justice in eyre (1774–1775) and keeper of the wardrobe (1775–1782), and was created earl of Chichester in 1801. His third son, George (1766–1827), was successively bishop of Bristol, Exeter and Lincoln. Thomas Pelham, 2nd earl of Chichester (1756–1826), son of the 1st earl, was surveyor-general of ordnance in Lord Rockingham's ministry (1782), and chief secretary for Ireland in the coalition ministry of 1783. In 1795 he became Irish chief secretary under Pitt's government, retiring in 1798; he was home secretary from July 1801 to August 1803 under Addington, who made him chancellor of the duchy of Lancaster in 1803. Pelham went out of office in 1804, and in the next year succeeded to the earldom. He was joint postmaster-general from 1807 to 1823, and for the remaining three years of his life postmaster-general. His son and heir, Henry Thomas Pelham (1804–1860), 3rd earl, was an efficient administrator, from 1830 until his death, and was greatly interested in various religious, philanthropic and educational movements; and two other sons were well-known men—Frederick Thomas Pelham (1808–1861), who became a rear-admiral in 1858, and subsequently lord-commissioner of the admiralty, and John Thomas Pelham (1811–1894), who was bishop of Norwich from 1857 to 1893. The third earl's son, Walter John Pelham (1838–1892), succeeded his father in 1886, and his nephew Jocelyn Brudenell Pelham (b. 1871) became 6th earl of Chichester in 1905.

Pelham, Henry (1660–1754), prime minister of England, younger brother of Thomas Holles Pelham, duke of Newcastle, was born in 1660. He was a younger son of Thomas, 1st Baron Pelham of Laughton (1650–1712; cr. 1706) and of Lady Grace Holles, daughter of the 3rd earl of Clare (see above). He was educated by a private tutor and at Christ Church, Oxford, which he entered in July 1670. As a volunteer he served in Dorrington's regiment at the battle of Preston in 1675, spent some time on the Continent, and in 1717 entered parliament for Seaforf, Sussex. Through strong family influence and the recommendation of Walpole he was chosen in 1721 a lord of the Treasury. The following year he was returned for Sussex county. In 1724 he entered the ministry as secretary of war, but this office he exchanged in 1730 for the more lucrative one of paymaster of the forces. He made himself conspicuous by his support of Walpole on the question of the excise, and in 1743 a union of parties resulted in the formation of an administration in which Pelham was prime minister, with the office of chancellor of the exchequer; but rank and influence made his brother, the duke of Newcastle, very powerful in the cabinet, and, in spite of a genuine attachment, there were occasional disputes between them, which led to difficulties. Being strongly in favour of peace, Pelham carried on the war with languor and indifferent success, but the country, wearied of the interminable struggle, was disposed to acquiesce in his foreign policy almost without a murmur. The king, thwarted in his favourite schemes, made overtures in 1746 to Lord Bath, but his purpose was upset by the resignation of the two Pelhams (Henry and Newcastle), who, however, at the king's request, resumed office.

Pelham remained prime minister till his death on the 9th of March 1754, when his brother succeeded him. His very defects were among the chief elements of Pelham's success, for one with a strong personality, moderate self-respect, or high conceptions of statesmanship could not have restrained the discordant elements of the cabinet for any length of time. Moreover, he possessed tact and a thorough acquaintance with the forms of the house. Whatever quarrels or insubordination might exist within the cabinet, they never broke out into open revolt. Nor can a high degree of praise be denied to his financial policy, especially his plans for the reduction of the national debt and the simplification and consolidation of its different branches.

He had married in 1726 Lady Catherine Manners, daughter of the 2nd duke of Rutland; and one of his daughters married Henry Fiennes Clinton, 2nd duke of Newcastle.

See W. Cox, Memoirs of the Pelham Administration, (2 vols., 1829). For the family history see Lower, Pelham Family (1873); and the Peerage, 1st ed., vols. 15–17.

Pelham, Henry Francis (1846–1907), English scholar and historian, was born at Berg Apton, Norfolk, on the 9th of September 1846, son of the Hon. John Thomas Pelham (1811–1894), bishop of Norwich, third son of the 2nd earl of Chichester. He was educated at Harrow and at Trinity College, Oxford, where he took a first class in literae humaniores in 1869. He was a tutor of Exeter College from 1869 to 1890. In 1887 he became university reader in ancient history, and two years later was elected to the Camden professorship. He became curator of the Bodleian library in 1892, and in 1897 president of Trinity College. He was also a fellow of Brasenose College, honorary fellow of Exeter, a fellow of the British Academy and of other learned societies, and a governor of Harrow School. His chief contribution to ancient history was his article on Roman history in the 9th edition of the Encyclopaedia Britannica (1875), which was republished with additions as the Outlines of Roman History (1880). His university lectures, though perhaps lacking in inspiration, were full of original research and learning. His death on the 13th of February 1907 not only prevented the publication in systematic form of his own important researches, but also delayed the appearance of much that had been left in MS. by H. Furneaux and A. H. J. Greenidge, and was at the time under his charge. Apart from the Outlines he published only The Imperial Domains and the Colosseum (1890), The Roman Frontier System (1895), and articles in periodicals of which the most important was an article in the Quarterly Review on the early Caesars (April, 1905). He did much for the study of archaeology at Oxford, materially assisted the Hellenic Society and the British School at Athens, and was one of the founders of the British School at Rome. He married in 1873 Laura Priscilla, daughter of Sir Edward North Buxton.

Pelias, in Greek legend, son of Poseidon and Tyro, daughter of Salmones. Because Tyro afterwards married her father's brother Cretheus, king of Iolcus in Thessaly, to whom she bore Aeolus, Phere and Amythaon, Pelias was by some thought to be
PELICAN—PÉLISSIER

the son of Cretheus. He and his twin-brother Neleus were exposed by their mother, but were nurtured by a landsman. When grown to manhood they were acknowledged by their mother. After the death of Cretheus, Pelias made himself master of the kingdom of Iolous, having previously quarrelled with Neleus, who removed to Messenia, where he founded Pylos.

In order to rid himself of Jason, Pelias sent him to Colchis in quest of the golden fleece, and took advantage of his absence to put to death his father, Aeson, his mother and brother. When Jason returned he sought to avenge the death of his parents, and Medea persuaded the daughters of Pelias to cut in pieces and boil their father, assuring them that he would thus be restored to youth. Acutas, son of Pelias, drove out Jason and Medea and celebrated funeral games in honour of his father, which were celebrated by the poet Stesichorus and represented on the chest of Cypselus. The death of Pelias was the subject of Sophocles' Rhizotomus (Root-cutters), and in the Tyro he treated another portion of the legend. Pelades (the daughters of Pelias) was the name of Euripides' first play.

PELICAN (Fr. Pélïcan; Lat. Pelecanus or Pelicanus), a large fish-eating water-fowl, remarkable for the enormous pouch which extends from the lower jaws of its long, and apparently formidable bill. The pouch contains, in the ordinary pelican, the Onocrotalus of the ancients, to whom it was well known, and the Pelecanus onocrotalus of ornithologists, is a very abundant bird in some districts of south-eastern Europe, south-western Asia and north-eastern Africa, occasionally straying, it is believed, into the northern parts of Germany and France; but the possibility of such wanderers having escaped from confinement is always to be regarded, since few zoological gardens are without examples. Its usual haunts are the shallow margins of the larger lakes and rivers, where fishes are plentiful, since it requires for its sustenance a vast supply of them. The nest is formed among reeds, placed on the ground and lined with grass. Therein two eggs, with white, chalky shells, are commonly laid. The young during the first twelvemonth are of a greyish-brown, but when mature almost the whole plumage, except the black primaries, is white, deep suffused by a rich blush of rose or salmon-colour, passing into yellow on the crest and lower part of the neck in front. A second and somewhat larger series, Pelecanus crispus, also inhabits Europe, but has a more eastern distribution. This, when adult, is readily distinguishable from the ordinary bird by the absence of the blush from its plumage, and by the curled feathers that project from and overhang each side of the head, which with some difference of coloration of the bill, pouch, bare skin round the eyes and irides give it a wholly distinct expression. Two specimens of the P. crispus have been found in the English fens (Ibis, 1868, p. 363; Proc. Zool. Society, 1871, p. 702), thus proving the existence of the bird in England at no very distant period, and one of them being that of a young example points to its having bred in this country. It is possible from their large size that they belonged to P. crispus. Ornithologists have been much divided in opinion as to the number of living species of the genus Pelecanus (cf. op. cit., 1868, p. 264; 1866, p. 571; 1871, p. 631)—the estimate varying from six to ten or eleven; but the former is the number recognized by M. Dubois (Bull. Mus. de Belgique, 1883). North America has one, P. erythrorhynchos, very similar to P. onocrotalus both in appearance and habits, but remarkable for a triangular, horn-like excrescence developed on the ridge of the male's bill in the breeding season, which falls off without leaving trace of its existence when that is over. Australia has P. conspicillatus, easily distinguished by its black tail and wing-coverts. Of more marine habit are P. philippensis and P. fuscus, the former having a wide range in Southern Asia, and, it is said, reaching Madagascar, and the latter common on the coasts of the warmer parts of both North and South America.

The genus Pelecanus as instituted by Linnaeus included the cormorant (q.v.) and gannet (q.v.) as well as the true pelicans, and for a long while these and some other distinct groups, as the snake-birds (gra), frigate-birds (gra) and tropic-birds (gra), which have the feather toes of the frigate-birds, were regarded as forming a single family, Pelecanidae; but this name has now been restricted to the pelicans only, though all are still usually associated in the suborder Steganopodes of Ciconiiform birds. It may be necessary to state that there is no foundation for the venerable legend of the pelican feeding her young with blood from her own breast, which has given it an important place in ecclesiastical heraldrty, except that, as A. D. Bartlett suggested (Proc. Zool. Society, 1886, p. 146), the curious bloody secretion ejected from the mouth of the flamingo may have given rise to the belief, through that bird having been mistaken for the "Pelican of the wilderness." (A. N.)

PELION, a wooded mountain in Thessaly in the district of Magnesia, between Volo and the east coast. Its highest point (mod. Plessidi) is 3340 ft. It is famous in Greek mythology; the giants are said to have piled it on Ossa in order to scale Olympus, the abode of the gods; it was the home of the centaurs, especially of Chiron, who had a cave near its summit, and educated many youthful heroes; the ship "Argo" was built in the woods of Pelion. On the spot where, according to the altars of Zeus Actaeus, in whose honour an annual festival was held in the dog-days, and worshippers clad themselves in skins.

PELISSE (through the Fr. from Lat. pelissa: sc. vestis, a garment made of fur, peliss, skin, properly a name of a cloak made of or lined with fur, hence particularly used of the fur-trimmed "dolman" worn from the shoulders by hussar regiments. The word is now chiefly employed as the name of a long-sleeved cloak of any material worn by women and children.

PÉLISSIER, AIMABLE JEAN JACQUES (1794-1864), duke of Malakoff, marshal of France, was born on the 6th of November 1794 at Maromme (Seine Inférieure), of a family of prosperous artisans or yeoman, his father being employed in a powder-magazine. After attending the military college of La Flèche and the special school of St Cyr, he in 1815 entered the army as sub-lieutenant in an artillery regiment. A brilliant examination in 1819 secured his appointment to the staff. He served as aide-de-camp in the Spanish campaign of 1823, and in the expedition to the Morea in 1828-29. In 1830 he took part in the expedition to Algeria, and on his return was promoted to the rank of chef d'escadron. After some years' staff service in Paris he was again sent to Algeria as chief of staff of the province of Oran with the rank of lieutenant-colonel, and remained there till the Crimean War, taking a prominent part in many important operations. The severity of his conduct in suppressing a whole Arab tribe in the Dahra or Dahnna caves, near Mustagam, where they had taken refuge (June 18, 1845), awakened such indignation in Europe that Marshal Soult, the minister of war, publicly expressed his regret; but Marshal Bugeaud, the governor-general of Algeria, not only gave it his approval, but secured for Péliisser the rank of general of brigade, which he held till 1850, when he was promoted general of division. After the battles of October and November 1854 before Sevastopol, Péliisser was sent to the Crimea, where on the 16th of May 1855 he succeeded Marshal Canrobert as commander-in-chief of the French forces before Sevastopol (see Crimean War). His conduct was marked by relentless pressure of the enemy and unalterable determination to conduct the campaign without interference from Paris. His perseverance was crowned with success. 

The legend was commonly believed in the middle ages. Epithalamium Nuptiarum (Epithalamus, 1888), writes that the female bird, in cherishing her young, wounds them with loving, and pierces their sides, and they die. After three days the male pelican comes and finds them dead, and his heart is pained. He then anges down over the water, and, when the dead young ones the blood trickles down, and thus are they made alive again. The pelican "in his piety"—i.e. in this pious act of reviving his offspring — was a common subject for 15th-century emblem books; it became a symbol of self-sacrifice, a type of Christian redemption and of the Eucharistic doctrine. The device was adopted by Bishop Fox in 1516 for his new college of Corpus Christi, Oxford.—[H. C.]
success in the storming of the Malakoff on the 8th of September. On the 12th he was promoted to be marshal. On his return to Paris he was named senator, created duke of Malakoff (July 22, 1856), and rewarded with a grant of 100,000 francs per annum. From March 1858 to May 1859 he was French ambassador in London, whence he was recalled to take command of the army of observation on the Rhine. In the same year he became grand chancellor of the Legion of Honour. In 1860 he was appointed governor-general of Algeria, and he died there on the 22nd of May 1864.

See Marbaud, Le Maréchal Pelissier (1863); Castille, Portraits historiques, 2nd series (1859).

PELL, JOHN (1610–1689), English mathematician, was born on the 15th March 1610 at Southwick in Sussex, where his father, a minister. He was educated at Steyning, and entered Trinity College, Cambridge, at the age of thirteen. During his university career he became an accomplished linguist, and even before he took his M.A. degree (in 1630) corresponded with Henry Briggs and other mathematicians. His great reputation and the influence of Sir William Boswell, the English resident, with the states-general procured his election in 1643 to the chair of mathematics in Amsterdam, whence he removed in 1646, on the invitation of the prince of Orange, to Breda, where he remained till 1652.

From 1654 to 1658 Pell acted as Cromwell’s political agent to the Protestant cantons of Switzerland. On his return to England he took orders, and was appointed by Charles II. to the office of Spanish and Portuguese ambassador, and in 1657 to that of states- general. He was elected fellow of the Royal Society in 1656. His devotion to mathematical science seems to have interfered alike with his advancement in the Church and with the proper management of his private affairs. For a time he was confined as a debtor in the king’s bench prison. He lived, on the invitation of Dr Whistler, for a short time in 1682 at the College of Physicians, but died on the 12th of December 1685 at the house of Mr Cothorne, reader of the church of St Giles-in-the-Fields. Many of Pell’s manuscripts fell into the hands of Dr Busby, master of Westminster School, and afterwards came into the possession of the Royal Society; they are still preserved in something like forty folio volumes, which contain, not only Pell’s own memoirs, but much of his correspondence with the mathematicians of his time.

The Diophantine analysis was a favourite subject with Pell; he lectured on it at Amsterdam; and he is now best remembered for the indeterminate equation $ax^2 + 1 = y^2$, which is known by his name. This problem was proposed by Pierre de Fermat first to Henri Fermic de Desville, and in 1657 to all mathematicians. Pell’s connexion with the problem simply consists of the publication of the solutions of John Wallis and Lord Brouncker in his edition of Bracelin’s Translation of Rhonius’s Algebra (1668). His chief works are: Mathematical History of Observations of Heavenly Motions and Appearances (1634); Epsiles proposita (1634); Controversy with Longomontanus concerning the Quadrature of the Circle (1647); An Idea of the Mathematics, 12mo (1660); A Table of Ten Thousand Number Squares (1661).

PELLA, the capital of ancient Macedonia under Philip II. (who transferred the seat of government hither from Edessa) and Alexander the Great, who was born here. It seems to have retained some importance up to the time of Hadrian. Scanty remains exist and some springs in the neighbourhood are still known as the baths of Pel. The site (identified by Leake) is occupied by the village of Neohori (Turk. Yeni-Ken) about 32 m. north-west of Salonika.

PELLAGRA (Ital. pelle agra, smarting skin), the name given, from one of its early symptoms, to a peculiar disease, of comparatively modern origin. For some time it was supposed to be practically confined to the peasantry in parts of Italy (particularly Lombardy) and France, and in the Austrians (mais de la rose), Rumania and Corfu. But it has recently been identified in various outlying parts of the British Empire (Barbadoes, India) and in both Lower and Upper Egypt; also among the Zulus and Basutos. In the United States sporadic cases had been observed up to 1866, but since then numerous cases have been reported. It is in Italy, however, that it has been most prevalent. The malady is essentially chronic in character. The indications usually begin in the spring of the year, declining towards autumn, and recurring with increasing intensity and permanence in the spring following. A peasant who is acquiring the malady feels unfit for work, suffers from headaches, giddiness, singing in the ears, a burning of the skin, especially in the hands and feet, and diarrhoea. At the same time a red rash appears on the skin, of the nature of erysipelas, the red or livid spots being tense and painful, especially where they are directly exposed to the sun. About July or August of the first season these symptoms disappear, the spots on the skin remaining rough and dry.

The spring attack of the year following will probably be more severe and more likely to leave traces behind it; with each successive year the patient becomes more like a mummy, his skin shrivelled and sallow, and even black at certain spots, as in Addison’s disease, his angles pro- truding, his muscles wasted, his movements slow and languid, and his sensibility diminished. Meanwhile there are more special symptoms relating to the nervous system, including dropping of the eyelid, dilatation of the pupil, and other disorders of vision, together with symptoms relating to the digestive system, such as a red and dry tongue, a burning feeling in the mouth, pain on swallowing, and diarrhoea. After a certain stage the disease passes into a profound disorganization of the nervous system; there is a tendency to melancholy, imbecility, and a curious mummified condition of body. After death a general tissue degeneration is observed.

It is known that the disease has recently come up for new investigation in connexion with the new work done in relation to sleeping-sickness and other tropical diseases. So long as it was supposed to be peculiar to the Italian peasantry, it was associated simply with their staple diet, and was regarded as due to the eating of mouldy maize. It was by his views in this regard that Lombroso (q.v.) first made his scientific reputation. But the area of maize consumption is now known to be wider than that of pellagra, and pellagra is found where maize is at least not an ordinary diet. In 1905 Dr L. W. Sambon, the meeting of the British Medical Association, suggested that pellagra was probably protozoal in origin, and subsequently he announced his belief that the protozoan was communicated by sand-flies, just as sleeping-sickness by the tsetse fly; and this opinion was supported by the favourable action of malaria in the treatment of the disease. His hypothesis was endorsed by Sir Patrick Manson, and in January 1910 an influential committee was formed, to enable Dr Sambon to pursue his investigations in a pellagous area.

PELLETAN, CHARLES CAMILLE (1846– ), French politician and journalist, was born in Paris on the 28th of June 1846, the son of Eugene Pelletan (1813–1884), a writer of romances; distin- guished and a noted opponent of the Second Empire. Camille Pelletan was educated in Paris, passed as licentiate in law, and was qualified as an “archivist palaeographer.” At the age of twenty he became an active contributor to the “L’echo des Batignolles.”

After the war of 1870–71 he took a leading place among the most radical section of French politicians, as an opponent of the “opportunists” who continued the policy of Gambetta. In 1880 he became editor of Justice, and worked with success to bring about a revision of the sentences passed on the Communards. In 1881 he was chosen member for the tenth arrondissement of Paris, and in 1883 for the Bouches du Rhone, being re-elected in 1886, 1893 and 1898; and he was repeatedly chosen as “reporter” to the various bureaux. During the Nationalist and Dreyfus agitations he fought vigorously on behalf of the Republican government and when the coalition known as the “Bloé” was formed he took his place as a Radical leader. He was made minister of war in the cabinet of M. Combes, June 1905, to January 1906, and his administration was severely criticized, notably by M. de Lanessan and other naval experts. During the great sailors’ strike at Marseilles in 1904 he showed pronounced sympathy with the socialistic aims and methods of the strikers, and a strong feeling was aroused that
his radical sympathies tended to a serious weakening of the navy and to destruction of discipline. A somewhat violent controversy resulted, in the course of which M. Pellcaen's indiscreet speeches did him no good; and he became a common subject for ill-natured caricatures. On the fall of the Combes ministry he became less prominent in French politics.

PELLICANUS, CONRAD (1478-1559), German theologian, was born at Ruffach in Alsace, on the 8th of January 1478. His German name, Kürsner, was changed to Pellicanus by his mother's brother Jodocus Gallus, an ecclesiastical connected with the university of Heidelberg, who supported his nephew for sixteen months at the university in 1491-1492. On returning to Ruffach, he taught gratis in the Minorite convent school that he might borrow books from the library, and in his sixteenth year resolved to become a friar. This step helped his studies, for he was sent to Tübingen in 1496 and became a favourite pupil of the guardian of the Minorite convent there, Paulus Scriptoris, a man of considerable general learning. There seems to have been at that time in south-west Germany a considerable amount of sturdy independent thought among the Franciscans; Pellicanus himself became a Protestant very gradually, and without any such revulsion of feeling as marked Luther's conversion. At Tübingen the future "apostate in three languages" was able to begin the study of Hebrew. He had no teacher and no grammar; but Paulus Scriptoris carried him a huge codex of the prophets on his own shoulders all the way from Mainz. He learned the letters from the transcription of a few verses in the Star of the Messiah of Petrus Niger, and, with a subsequent hint or two from Reuchlin, who also lent him the grammar of Moses Kimḥi, made his way through the Bible for himself with the help of Jerome's Latin. He got on so well that he was not only a useful helper to Reuchlin but anticipated the manuals of the great Hebraist by composing in 1501 the first Hebrew grammar in the European tongue. It was printed in 1503, and afterwards included in the works of Reuchlin's friend Petrus Raphelis. Hebrew remained a favourite study to the last. Pellicanus's autobiography describes the gradual multiplication of accessible books on the subjects, and he not only studied but translated a vast mass of rabbinical and Talmudic texts, his interest in Jewish literature being mainly philological. The chief fruit of these studies is the vast commentary on the Bible (Zürich, 7 vols., 1532-1539), which shows a remarkably sound judgment on questions of the text, and a sense for historical as opposed to typological exegesis.

Pellicanus became priest in 1501 and continued to serve his order at Ruffach, Pforzheim, and Basel till 1526. At Basel he did much laborious work for Froben's editions, and came to the conclusion that the Church taught many doctrines of which the early doctors of Christendom knew nothing. He spoke his views frankly, but he disliked polemic; he found also more toleration than might have been expected, even after he became active in circulating Luther's books. Thus, supported by the civic authorities, he remained guardian of the convent of his order at Basel from 1519 till 1524, and even when he had to give up his post, remained in the monastery for two years, professing theology in the university. At length, when the position was becoming quite untenable, he received through Zwingli a call to Zürich as professor of Greek and Hebrew, and formally throwing off his monk's habit, entered on a new life. Here he remained till his death on the 6th of April 1556.

Pellicanus's scholarship, though not brilliant, was really extensive; his sound sense, and his singularly pure and devoted character gave him a great influence. He was remarkably free from the pedantry of the time, as is shown by his views about the use of the German vernacular as a vehicle of culture (Chron. 135, 36). As a theologian his natural affinities were with Zwingli, with whom he shared the advantage of having grown up to the views of the Reformation, by the natural progress of his studies and religious life. Thus he never lost his sympathy with humanism and with its great German representative, Erasmus.

Pellicanus's Latin autobiography (Chronicon C.P.R.) is one of the most interesting documents of the period. It was first published by Riggenbach in 1877, and in this volume the other sources for his life are registered. See also Emil Silberstein, Conrad Pellicanus; ein Beitrag zur Geschichte des Studiums der hebr. Sprache (Berlin, 1900).

PELLICIER, GUILLAUME (c. 1490-1568), French prelate and diplomatist, was educated by his uncle, the bishop of Maguelonne, whom he succeeded in 1520. In 1536 he had the seat of his bishopric transferred to Montpellier. Appointed ambassador at Venice in 1550, he fulfilled his mission to the entire satisfaction of Cardinal Lorraine, but on the discovery of the system of espionage he had employed the king had to recall him in 1542. Returning to his diocese, he was imprisoned in the château of Beauce for his tolerance of the Reformers, so he replaced his former indulgence by severity, and the end of his episcopate was disturbed by religious struggles. He was a man of wide learning, a humanist and a friend of humanists, and took a keen interest in the natural sciences. See J. Zeller, La Diplomatie française . . . d'après le correspondance de G. Pelliciér (Paris, 1881); and A. Tausserat-Kadel, Correspondance politique de Guillaume Pelliciér (Paris, 1899).

PELLICO, SILVIO (1788-1854), Italian dramatist, was born at Saluzzo in Piedmont on the 24th of June 1788, the earlier portion of his life being passed at Pinerolo and Turin under the tuition of a priest named Manavea. At the age of ten he composed a tragedy under the inspiration of Caesarotti's translation of the Ossianic poems. On the marriage of his twin sister Rosina with a maternal cousin at Lyons he went to reside in that city, devoting himself during four years to the study of French literature. He returned in 1810 to Milan, where he became professor of French in the Collegio degli Orfani Militari. His tragedy Francesca da Rimini, was brought out with success by Carlotta Marchioni at Milan in 1818. Its publication was followed by that of the tragedy Eufemia da Messina, but the representation of the latter was forbidden. Pellico had in the meantime continued his work as tutor, first to the unfortunate Alphonse, Duke of Enna, and then to the Duke of Calabria, the son of Umberto I. After his return to Turin in 1819, he was called to the service of the king, and became a representative of the government in the conciliatory relations with the Piedmontese. He threw himself heartily into an attempt to weaken the hold of the Austrian despoticism by indirect educational means. Of the powerful literary executive which gathered about Counts Porro and Confalonieri, Pellico was the able secretary—the management of the Conciliatore, which appeared in 1818 as the organ of the association, resting largely upon him. But the paper, under the censorship of the Austrian officials, ran for a year only, and the society itself was broken up by the government. In October 1820 Pellico was arrested on the charge of carbonarism and conveyed to the Santa Margherita prison. After his removal to the Piombi at Venice in February 1821, he composed several Cantiche and the tragedies Ester d'Engaddi and Iginia d'Asi. The sentence of death pronounced on him in February 1822 was finally commuted to fifteen years carcere duro, and in the following April he was placed in the Spielberg at Brinn. His chief work during this part of his imprisonment was the tragedy Leonzio della Dertona, for the preservation of which he was compelled to rely on his memory. After his release in 1830 he commenced the publication of his prison compositions, of which the Ester was played at Turin in 1831, but immediately suppressed. In 1832 appeared his Gismonda de Mandriaú, Erodiade and the Leonzio, under the title of Tre nuovi tragedie, and in the same year the work which gave him his European fame, Le Mic priogioni, an account of his sufferings in prison. The last gained him the friendship of the Marchesa di Barolo, the reformer of the Turin prisons, and in 1834 he accepted from her a yearly pension of 1200 francs. His tragedy Tommaso Moro had been published in 1833, his most important subsequent publication being the Opere inedite in 1837. On the decease of his parents in 1838 he was received into the Casa Barolo, where he remained till his death, assisting the marchesa in her charities, and writing chiefly upon religious themes. Of these works the best known is the Dei Dominio degli uomini, a series of trite maxims which do honour to his piety rather than to his critical judgment. A fragmentary biography of the marchesa by Pellico was published in Italian and English after her death. He died on the 31st of January 1854, and was
buried in the Campo Santo at Turin. His writings are defective in vivacity and breadth of thought, and his tragedies display neither the insight into character nor the constructive power of a great dramatist. It is in the simple narrative and naive egotism of Le Mie grigioni that he has established his strongest claim to remembrance, winning fame by his misfortunes rather than by his genius.

See Piero Maroncelli. Addizioni alle mie grigioni (Paris, 1834); the biographies by Latour; Gabriele Rosselli; Didier, Revue des deux mondes (September 1842); De Loménie, Galerie des contemp. illustr. iv. (1842); Chiala (Turin, 1852); Nollet-Fabert (1854); Giorgio Brävo (1854); Bourdon (1868); Rivieri (1899-1901).

PELLISSON, PAUL (1624-1693), French author, was born at Béziers on the 30th of October 1624, of a distinguished Calvinist family. He studied law at Toulouse, and practised at the bar of Castres. Going to Paris with letters of introduction to Valentin Conrat, who was a co-religionist, he became through him acquainted with the members of the Academy. Pellisson undertook to be their historian, and in 1653 published a Relation contenant l'histoire de l'académie française. This panegyric was rewarded by a promise of the next vacant place and by permission to be present at their meetings. In 1659 Pellisson became secretary to the minister of finance, Nicolas Fouquet, and when in 1661 the minister was arrested, his secretary was imprisoned in the Bastille. Pellisson had the courage to stand by his fallen patron, in whose defence he issued his celebrated Mémoire in 1661, with the title Discours au roi, par un des fidèles sujets sur le procès de M. de Fouquet, in which the facts in favour of Fouquet are marshalled with great skill. Another pamphlet, Seconde défense de M. Fouquet, followed. Pellisson was released in 1666, and from this date sought the royal favour. He became historiographer to the king, and in that capacity wrote a fragmentary Histoire de Louis XIV., covering the years 1660 to 1670. In 1670 he was converted to Catholicism and obtained rich ecclesiastical preferment. He died on the 7th of February 1693. He was very intimate with Mlle de Scudéry, in whose novels he figures as Herminius and Acante. His sterling worth of character made him many friends and justified Bussy-Rabutin's description of him as "encore plus honnête homme que bel esprit."

PELLITORY, in botany, the common name for a small hairy perennial herb which grows on old walls, hedgebanks and similar localities, and is known botanically as Parietaria officinalis (Lat. paries, a wall). It has a short woody rootstock from which spring erect or spreading stems 1 to 2 ft. long, bearing slender leafy branches, and axillary clusters of small green flowers. It belongs to the nettle order (Urticaeae), and is nearly allied to the nettle, Urtica, but its hairs are not stinging.

PELLOUX, LUIGI (1819-), Italian general and politician, was born on the 1st of March 1839, at La Roche, in Savoy, of parents who retained their Italian nationality when Savoy was annexed to France. Entering the army as lieutenant of artillery in 1857, he gained the medal for military valour at the battle of Custozza in 1860, and in 1870 commanded the brigade of artillery which battered the breach in the wall of Rome at Porta Pia. He was elected to the Chamber in 1881 as deputy for Leghorn, which he represented until 1895, and joined the party of the Left. He had entered the war office in 1870, and in 1880 became general secretary, in which capacity he introduced many useful reforms in the army. After a succession of high military commands he received the appointment of chief of the general staff in 1896. He was minister of war in the Rudini and Giolitti cabinets of 1891-1895. In July 1897, the portfolio of war in the Rudini cabinet, and was appointed senator. In May 1897 he secured the adoption of the Army Reform Bill, fixing Italian military expenditure at a maximum of £9,500,000 a year, but in December of that year he was defeated in the Chamber on the question of the promotion of officers. Resigning office, he was in May 1898 sent as royal commissioner to Bari, where, without recourse to martial law, he succeeded in restoring public order. Upon the fall of Rudini in June 1898, General Pelloux was entrusted by King Humbert with the formation of a cabinet, and took for himself the post of minister of the interior. He resigned office in May 1899, but was again entrusted with the formation of the ministry. He took stern measures against the revolutionary elements in southern Italy, and his new cabinet was essentially military and conservative. The Public Safety Bill for the reform of the police laws, taken over by him from the Rudini cabinet, and eventually promulgated by royal decree, was fiercely obstructed by the Socialist party, which, with the Left and Extreme Left, succeeded in forcing General Pelloux to dissolve the Chamber in May 1900, and to resign office after the general election in June. In the autumn of 1901 he was appointed to the command of the Turin army corps.

PELOMIX, so named by R. G. Geere, a genus of Lobose Rhizopoda (?), naked, multinucleate, with very blunt rounded pseudopodia, formed by erosion (see AMOEBA), often containing peculiar vesicles (glycojen?), and full of a symbiotic bacterium. It inhabits the ooze of decomposing organic matter at the bottom of ponds and lakes.

PELOPIDES (d. 364 B.C.), Theban statesman and general. He was a member of a distinguished family, and possessed great wealth which he expended on his friends, while content to lead the life of an athlete. In 383 B.C. he served in a Theban contingent sent to the support of the Spartans at Mantinea, where he was saved, when dangerously wounded, by Epaminondas (?). Upon the seizure of the Theban citadel by the Spartans (383 or 382) he fled to Athens, and took the lead in a conspiracy to liberate Thебes. In 379 his party surprised and killed their chief political opponents, and roused the people against the Spartan garrison, which surrendered to an army gathered by Pelopidas. In this and subsequent years he was elected boeotarch, and about 375 he routed a much larger Spartan force at Tegyra (near Orchomenus). This victory he owed mainly to the valor of the Sacred Band, a picked body of 300 infantry. At the battle of Leuctra (371) he contributed greatly to the success of Epaminondas's new tactics by the rapidity with which he made the Sacred Band close with the Spartans. In 370 he accompanied his friend Epaminondas as boeotarch into Peloponnesus. On their return both generals were unsuccessfully accused of having retained their command beyond the legal term. In 369, in response to a petition of the Thessalians, Pelopidas was sent with an army against Alexander, tyrant of Pherae. After driving Alexander out, he passed into Macedonia and arbitrated between two claimants to the throne. In order to secure the influence of Thesus, he brought home hostages, including the king's brother; afterwards Philip II., the conqueror of Greece. Next year Pelopidas was again called upon to interfere in Macedonia, but, being deserted by his mercenaries, was compelled to make an agreement with Ptolomeaus of Alorus. On his return through Thessaly he was seized by Alexander of Pherae, and two expeditions from Thesus were needed to secure his release. In 367 Pelopidas went on an embassy to the Persian king and induced him to prescribe a settlement of Greece according to the wishes of the Thesians. In 364 he received another appeal from the Thessalian towns against Alexander of Pherae. Though an eclipse of the sun prevented his bringing with him more than a handful of troops, he overthrew the tyrant's superior force on the ridge of Cynoscephale; but wishing to slay Alexander with his own hand, he rushed forward too eagerly and was cut down by the tyrant's guards.

PELOPONNESIAN WAR, in Greek history, the name given specially to the struggle between Athens at the head of the Delian League and the confederacy of which Sparta was the leading power. According to Thucydides the war, which was 1 Some historians prefer to call it the Second Peloponnesian War, the first being that of 431, which ended with the Thirty Years Peace.
in his view the greatest that had ever occurred in Greece, lasted from 431 to the downfall of Athens in 404. The genius of Thucydides has given to the struggle the importance of an epoch in world history, but his view is open to two main criticisms—(1) that the war was in its ultimate bearings little more than a local disturbance, viewed from the standpoint of universal history; (2) that it cannot be called a war in the strict sense. The former of these criticisms is justified in the article on Greece: History (g.e.). Unless we are to believe that the Macedonian supremacy is directly traceable to the mutual weakening of the Greek cities in 431-403, it is difficult to see what lasting importance attaches to the war. As regards the second, a few chief difficulties may be indicated. The very narrative even of Thucydides himself shows that the "war" was not a connected whole. It may be divided into three main periods—(1) from 431 to 421 (Lysias calls it the "Archidamian" War), when the Peace of Nicias, not merely formally, but actually produced a cessation of hostilities; (2) from 421 till the intervention of Sparta in the War; during these years there was no "Peloponnesian War," and there were several years in which there was in reality no fighting at all: the Sicilian expedition was in fact a side issue; (3) from 413 to 404, when fighting was carried on mainly in the Aegean Sea (Isocrates calls this the "Decelian" War). The disjointed character of the struggle is so obvious from Thucydides himself that historians have come to the conclusion that the idea of treating the whole struggle as a single unit was ex post facto (see Greece: History, § A, "Ancient" ad fin.).

The book itself affords evidence which goes far to justify this view. A very important problem is presented by bk. v., which is obviously put in as a connecting link to prove a theory. Thucydides expressly warns us not to regard the period of this book as one of peace, and yet the very contents of the book refute his argument. In 419 and 417 there is practically no fighting: the Mantinea War of 418 is a disconnected episode which did not lead to a resumption of hostilities: in 420 there are only obscure battles in Thrace: in 416 there is only the expedition to Melos; and finally from 421 to 413 there is official peace. Other details may be cited in corroboratio. Book v. (ch. 26) contains a second introduction to the subject; ἕως ἐκ πόλεμος in i. 23 and iv. 48 is the Archidamian or Ten Years’ War; in v. 26 we read of a πρῶτος πόλεμος, a υπότερος πόλεμος and an ἀνακοινώσεως. Some critics think on these and other grounds that Thucydides wrote and published bks. i.-v. 25 by itself, then bks. vi. and vii. (Sicilian expedition), and finally revising his view joined them into one whole by the somewhat unsatisfactory bk. v. 26 and following chapters, and began to round off the story with the incomplete bk. viii. (on this see Greece: History, as above). It is perhaps most probable that he retained notes made contemporaneously and worked them up some time after 404, in a few passages failing to correct inconsistencies and dying before bk. viii. was completed. The general introduction in bk. i. was undoubtedly written shortly after 404.

The causes of the war thus understood are complex. The view taken by Thucydides that Sparta was the real foe of Athens has been much modified by modern writers. The key to the situation is in fact the commercial rivalry of the Corinthians, whose trade (mainly in the West) had been seriously limited by the naval expansion of the Delian League. This rivalry was roused to fever heat by the Athenian intervention in 434-33 on behalf of Corcyra, Corinth’s rebellious colony (see CORINTH) and from that time the Corinthians felt that the Thirty Years’ Truce was at an end. An opportunity soon offered for making a counter attack. Potidaea, a Dorian town on the western promontory of Chalcidice in Thrace, a tributary ally of Athens—to which however Corinth as metropolis still sent annual magistrates—was induced to revolt,1 with the support of the Macedonian king Perdiccas, formerly an Athenian ally.

The Athenian Phormio succeeded in blockading the city so that its capture was merely a question of time, and this provided the Corinthians with an urgent reason for declaring war.

Prior to these episodes Athens had not been in hostile contact with any of the Peloponnesian confederate states for more than ten years, and Pericles had abandoned a great part of his imperial policy. He now laid an embargo upon Megara by which the Megarians were forbidden on pain of death to pursue trading operations with any part of the Athenian Empire. The circumstances of this decree (or decrees) are not material to the present argument (see Grote, History of Greece, ed. 1907, p. 370 note) except that it turned special attention to the commercial supremacy which Athens claimed to enjoy. In 432 a conference of Peloponnesian allies was summoned and the Corinthian envoys urged the Spartans to declare war on the ground that the power of Athens was becoming so great as to constitute a danger to the other states. This might have been urged with justice before the Thirty Years’ Truce (447); but by that truce Athens gave up all her conquests in Greece proper except Naupactus and Plataea, while her solitary gains in Amphipolis and Tauri were compensated by other losses. The fact that the Corinthian argument failed to impress Sparta and many of the delegates is shown by the course of the debate. What finally impelled the Spartans to agree to the war was the veiled threat by the Corinthians that they would be driven into another alliance (i.e. Argos, i. 71). We can hardly regard Sparta as the determined enemy of Athens at this time. Only twice since 461 had she been at war with Athens—in 457 (Tanagra) and 447, when she deliberately abstained from pushing the advantage which the revolt in Euboea provided; she had refused to help the oligarchs of Samos in 440. Corinth however had not only strong, but also immediate and urgent reasons (Potidaea and Corcyra) for desiring war. It has been argued that the war was ultimately a struggle between the principles of oligarchy and democracy. This view, however, cannot be taken of the early stages of the war when there was democracy and oligarchy on both sides (see SPARTA). It is only in the later stages that the political difference is prominent.

The Opposing Forces.—The permanent strength of the Peloponnesian confederacy lay in the Peloponnesian states, all of which except Argos and Achaea were united under Sparta’s leadership. But it included also extra-Peloponnesian states—viz. Megara, Phocis, Boeotia and Locris (which had formed part of the Athenian land empire), and the maritime colonies round the Ambracian Gulf. The organization was not elaborate. The federal assembly with few exceptions met only in time of war, and then only when Sparta agreed to summon it. It met in Sparta and the delegates, having stated their views before the Spartan Apella, withdrew till the Apella had come to a decision. The delegates were then invited to return and to confirm that decision. It is clear that the link was purely one of common interest, and that Sparta had little or no control over it. So powerful a confederate as Corinth, Sparta was the chief member of the confederacy (hegemón), but the states were autonomous. In time of war each had to provide two-thirds of its forces, and that state in whose territory the war was to take place had to equip its whole force.

The Athenian Empire is described elsewhere (DELIAN LEAGUE, ATHENS). Here it must suffice to point out that there was among the real and technical allies no true bond of interest, and that many of the states were in fact bound by close ties to members of the Peloponnesian confederacy (e.g. Potidaea to Corinth). Sparta could not only rely on voluntary co-operation but could undermine Athenian influence by posing as the champion of autonomy. Further, Thucydides is wrong on his own showing in saying that Sparta refused to tolerate democratic government in confederate cities: it was not till after 418 that this policy was adopted. Athens, on the other hand, had undoubtedly interfered in the interest of democracy in various allied states (see DELIAN LEAGUE).

No detailed examination of the comparative military and naval resources of the combatants can here be attempted. On land the Peloponnesians were superior: they had at least 30,000

---

1 The importance of this revolt lay in the fact that it immediately involved danger to Athens throughout the Chalcidic promontories, and her north-east possessions generally.
hooplites not including 10,000 from Central Greece and Boeotia: these soldiers were highly trained. The Athenian army was undoubtedly smaller. There has been considerable discussion as to the exact figures, the evidence in Thucydides being highly confusing, but it is most probable that the available fighting force was not more than half that of the Peloponnesian confederacy. Even of these we learn (Thuc. iii. 87) that 4400 died in the great plague. The only light-armed force was that of Boeotia at Delium (10,000 with 500 peltasts). Of cavalry Athens had 1000, Boeotia a similar number. The only other cavalry force was that of Thessaly, which, had it been loyal to Athens, would have meant a distinct superiority. In naval power the Athenians undoubtedly had an overwhelming advantage at the beginning, both in numbers and in training.

Financially Athens had an enormous apparent advantage. She began with a revenue of 1000 talents (including 600 from οὐραμαχαις), and had also, in spite of the heavy expense which the building schemes of Pericles had involved, a reserve of 6000 talents. The Peloponnesians had no reserve and no fixed revenue assessment. On the other hand the Peloponnesian armies were unpaid, while Athens had to spend considerable sums on the payment of crews and mercenaries. In the last stages of the war the issue was determined by the poverty of Athens and Persian gold.

The events of the struggle from 431 to 404 may be summarized in the three periods distinguished above.

1. The Ten Years' or Archidamian War.—The Spartans sent to Athens no formal declaration of war but rather sought first to create some specious casus belli by sending requisitions to Athens. The first, intended to inflame the existing hostilities against Pericles (q.v.) in Athens, was that he should be expelled the city as being an Alcmaeonid (grand-nephew of Cleisthenes) and so implicated in the curse pronounced on the murderers of Cylon nearly 200 years before. This outrageous demand was finally meet by the Athenians that the Athenians should (1) withdraw from Potidae, (2) restore autonomy to Aegina, and (3) withdraw the embargo on Megarian commerce. Upon the refusal of all these demands Sparta finally made the maintenance of peace contingent upon the restoration by Athens of autonomy to all her allies. Under the guidance of Pericles Athens replied that she would do nothing on compulsion, but was prepared to submit difficulties to amicable arbitration on the basis of mutual concessions. Before anything could come of this proposal, matters were precipitated (end of March 431) by the attack of Thebes upon Plataea (q.v.), which immediately sought and obtained the aid of Athens. War was begun. The Spartan king Archidamus assembled his army, sent a herald to announce his approach, marched into Attica and besieged Oenoec.

Meanwhile Pericles had decided to act on the defensive, i.e. to abandon Attica, collect all its residents in Athens and treat Athens as an island, retaining meanwhile command of the sea and making despatches on Peloponnesian shores. To this end which Thucydides and Grote commend, had grave defects—though it is by no means easy to suggest a better; e.g. it meant the ruin of the landed class, it tended to spoil the moral of those who from the walls of Athens annually watched the wasting of their homesteads, and it involved the many perils of an over-crowed city—a peril increased by, if not also the cause of, the plague. Moreover sea power was nothing everywhere, and delay exhausted the financial reserves of the state, while financial considerations, as we have seen, were comparatively unimportant to the Peloponnesians. The descents on the Peloponnesian were futile in the extreme.

Archidamus, having wasted much territory, including Acharnae, retreating at the end of July. The Athenians retaliated by attacking Methone (which was secured by Brasidas), by successes in the West, by expelling all Aeginetans from Aegina (which was made a cleruchy), and by wasting the Megarid.

In 430 Archidamus again invaded Attica, systematically wasting the country. Shortly after he entered Attica plague broke out in Athens, borne thither by traders from Carthage or Egypt (Holin, Greek History, ii. 346 note). The effect upon the overcrowded population of the city was terrible. Of the 1200 cavalry (including mounted archers) 300 died, together with 4400 hoplites: altogether the estimate of Diodorus (xii. 58) that more than 10,000 citizens and slaves succumbed is by no means excessive. None of the less Pericles sailed with 100 triremes, and ravaged the territory near Epidaurus. Subsequently he returned and the expedition proceeded to Potidaea. But the plague went with them and no results were achieved. The enemies of Pericles who even with the aid of Spartan intrigue had hitherto failed to harm his prestige, now succeeded in inducing the desperate citizens to fine him for alleged malversation. The verdict, however, shocked public feeling and Pericles was reinstated in popular favour as strategus (c. Aug. 430). About a year later he died. In the autumn of 430 a Spartan attack on Zacynthus failed and the Ambracians were repulsed from Amphiliolian Argos. In reply Athens sent Phormio to Nauactus to watch her interests in that quarter. In the winter Potidaea capitulated, receiving extremely favourable terms.

In 429 the Peloponnesians were deterred by the plague from invading Attica and laid siege to Plataea in the interests of Thebes. The Athenians failed in an expedition to Chalcidice under Xenophon, while the Spartan Cnemus with Chaonian and Epictus allies was repulsed from Stratus, capital of Acrania, and Phormio with only 20 ships defeated the Corinthian fleet of 47 sail in the Gulf of Corinth. Orders were the once sent from Sparta to repair this disaster and 77 ships were equipped. Help sent from Athens was diverted to Crete, and after much manoeuvring Phormio was compelled to fight off Nauactus. Nine of his ships were driven ashore, but with the other he subsequently defeated the enemy and recovered the lost nine. With the reinforcement which arrived afterwards he established complete control of the western seas. A scheme for operating with Sitalces against the Chalcidians of Thrace fell through, and Sitalces joined Pericles.

In 428-427 Athens was invaded by a third invasion of Attica and by the revolt of Lesbos from Athens. After delay in fruitless negotiations the Athenian Cleippides, and afterwards Paches, besieged Mytilene, which appealed to Sparta. The Peloponnesian confederacy resolved to aid the rebels both directly and by a counter demonstration against Athens. The Athenians, though their reserve of 6000 talents was by now almost exhausted (except for 1000 talents in a special reserve), made a tremendous effort (raising 200 talents by a special property tax), and not only prevented an invasion by a demonstration of 100 triremes at the Isthmus, but sent Asopius, son of Phormio, to take its place in the western seas. In spring 427 the Spartans again invaded Attica without result. The winter of 428-427 was marked by the daring escape of half the Plataeans garrison under cover of a stormy night, and by the capitulation of Mytilene, which was forced upon the oligarchic rulers by the democracy. The Spartan fleet arrived too late and departed without attempting to recover the town. Paches cleared the Asiatic seas of the enemy, reduced the other towns of Mytilene and returned to Athens with upwards of 1000 prisoners. An assembly was held and under the invective of Cleon (q.v.) it was decided to kill all male Mytileneans of military age and to sell the women and children as slaves. This decree, though in accordance with the rigorous customs of ancient warfare as exemplified by the treatment which Sparta shortly afterwards meted out to the Plataeans, shocked the feelings of Athens, and on the next day it was (illegally) rescinded just in time to prevent Paches carrying it out. The thousand 1 oligarchic prisoners were however executed, and Lesbos made a cleruchy.

Meanwhile there occurred civil war in Corcyra, in which ultimately, with the aid of the Athenian admiral Eurymedon, the democracy triumphed amid scenes of the wildest savagery. In the autumn of the year Niciss fortified Minoa at the mouth of the harbour of Megara. Shortly afterwards the Spartans

1 So Thuc. iii. 50. It is suggested that this number is an error for 30 or 50 (i.e. A or N for A). It seems incredible that 1000 could be described as 'ringleaders' out of a population of perhaps 5000.
planted an unsuccessful colony at Heraclea in the Trachinian territory north-west of Thermopylae.

In the summer of 426 Nicias led a predatory expedition along the north-west coast without achieving any positive victory. More important, though equally ineffective, was the scheme of Demostrhenes to march from Naupactus through Aetolia, subduing the wild hill tribes, to Cytinium in Doris (in the upper valleys of the Cephissus) and thence to Boeotia, which was to be attacked simultaneously from Attica. The scheme was crushed by the courage and skill of the Aetolians, who thereupon summoned Spartan and Corinthian aid for a counter attack on Naupactus. Demostrhenes averted this, and immediately afterwards by superior tactics inflicted a complete defeat at Opiae in Acarnania on Eurylochus at the head of a Spartan and Ambracian force. An Ambracian reinforcement was annihilated at one of the peaks called Idomene, and a disgraceful truce was accepted by the surviving Spartan leader Menedaeus. This was not only the worst disaster which befell any powerful state up to the peace of Nicias (as Thucydides says), but was a serious blow to Corinth, whose trade on the West was as we have seen, one of the chief causes of the war.

The basic cause for the Spartan disaster of Pylos (q.v.). The Athenians had despatched 40 triremes under Eurymenton and Procles to Sicily with orders to call first at Corcyra to prevent an expected Spartan attack. Meantime Demostrhenes had formed the plan of planting the Messenians of Naupactus in Messenia—now Spartan territory—and obtained permission to accompany the expedition. The fleet was, as it was, charged, delayed by a storm in the Bay of Navarino, and rough fortifications were put up by the sailors on the promontory of Pylos. Demostrhenes was left behind in this fort. and the Spartans promptly withdrew from their annual raid upon Attica and their projected attack on Corcyra to dislodge him. After a naval engagement (see Pylos) a body of Spartan hoplites were cut off on Sphacteria. So acutely did Sparta feel their position that an offer of peace was made on condition that the hoplites should go free. The eloquence of Cleon frustrated the peace party's desire to accept these terms, and ultimately to the astonishment of the Greek world the Spartan hoplites to the number of 292 surrendered unconditionally (see CLeon).

Thus in 426 the Athenians had seriously damaged the prestige of Sparta, and broken Corinthian supremacy in the north-west, and the Peloponnnesians had no fleet. This was the zenith of their success, and it was unfortunate for them that they declined the various offers of peace which Sparta made. The next two years changed the whole position. The doubling of the tribute in 425 pressed hardiy on the allies (see DELIAN LEAGUE): Nicias failed in a plot with the democratic party in Megara to seize that town; and the brilliant campaigns of Brasidas (q.v.) in the north-east, culminating in the capture of Amphipolis (422), finally destroyed the Athenian hopes of recovering their land empire, and entirely restored the balance of success and Spartan prestige. Moreover, the admirably conceived scheme for a simultaneous triple attack upon Boeotia at Chaeronea in the north, Delium in the south-east, and Siphæ in the south-west had fallen through owing to the inefficiency of the generals. The scheme, which probably originated with the atticizing party in Thebes, resulted in the severe defeat of Hippocrates at Delium by the Boeotians under Pagenias, and was a final blow to the policy of an Athenian land empire.

These disasters at Megara, Amphipolis and Delium left Athens with only one trump card—the possession of the Spartan hoplites captured in Sphacteria. This solitary success had already in the spring of 423 induced Sparta in spite of the successes which Brasidas was achieving in Thrace to accept the "truce of Laches"—which, however, was rendered abortive by the refusal of Brasidas to surrender Scione. The final success of Brasidas at Amphipolis, where both he and Cleon were killed, paved the way for a more permanent agreement, the peace parties at Athens and Sparta being in the ascendant.

The tragic fiasco of the Sicilian expedition, involving the death of 1

1 From 421 to 413.—Peace was signed in March 421 on the basis of each side's surrendering what had been acquired by the war, not including those cities which had been acquired by capitulation. It was to last for five years. Its weak points, however, were numerous. Whereas Sparta had lost in all the allied interested in the war, and apart from the campaigns of Brasidas had on the whole taken little part in it, her allies benefited least by the terms of the Peace. Corinth did not regain Sollium and Anactorium, while Megara and Thebes respectively were indignant that Athens should retain Nissaæ and receive Panactum. These and other reasons rapidly led to the isolation of Sparta, and there was a general refusal to carry out the terms of agreement. The history of the next three years is therefore one of complex inter-state intrigues combined with internal political convulsions. In 421 Sparta and Athens concluded a defensive alliance; the Sphactarian captives were released and Athens promised to abandon Pylos. Such a peace, giving Sparta everything and Athens nothing but Sparta's bare alliance, was due to the fact that Nicias and Alcibiades were both seeking Sparta's friendship. At this time the Fifty Years' Truce between Sparta and Argos was expiring. The Peloponnesean malcontents turned to Argos to get a new leader, and an alliance was formed between Argos, Corinth, Elis, and the Thessalian League (see Thespian.). This coalition between two different elements—an anti-oligarchic party and a war party—had no chance of permanent existence. The war party in Sparta regained its strength under new ephors and negotiations began for an alliance between Sparta, Argos and Boeotia. The details cannot here be discussed. The result was a re-shuffling of the cards. The democratic states of the Peloponnese were driven, partly by the intrigues of Alcibiades, now anti-Laconian, into alliance with Athens, with the object of establishing a democratic Peloponnese under the leadership of Argos. These unstable combinations were soon after upset by Alcibiades himself, who, having succeeded in displacing Nicias as strategus in 419, allowed Athenian troops to help in attacking Epidauros. For a cause not easy to determine Alcibiades was defeated by Nicias in the election to the post of strategus in the next year, and the suspicions of the Peloponnesean coalition were roused by the inadequate assistance sent by Athens, which arrived too late to assist Argos when the Spartan king Agis marched against it. Ultimately the Spartans were successful over the coalition at Mantinea, and thence afterwards an oligarchic revolution at Argos led to an alliance between that city and Sparta (c. Feb. 417). This oligarchy was overthrown again in June, and the new democracy having vainly sought an agreement with Sparta rejoined Athens. It was thus left to Athens to expend men and money on protecting a democracy by the aid of which she had hoped practically to control the Peloponneseus. All this time, however, the alliance between her and Sparta was not officially broken.

The unsatisfactory character of the Athenian Peloponnesean coalition was one of the negative causes which led up to the Sicilian Expedition of 415. Another negative cause may be connected in the failure of an attempt or attempts to subdue the Thracian westward. By combining the evidence of Plutarch (in his comparison of Nicias and Crassus), Thuc. v. 83, and the inscription which gives the treasury payments for 418-415 (Hicks and Hill, Gr. Hist. Inscr. 70), we can scarcely doubt that there were expeditions in 418 (Euthydemus) and the summer of 417 (Nicias)—and that in the winter of 417 a blocking squadron under Chaeremon was despatched. This policy, which was presumably that of Nicias in opposition to Alcibiades—having failed, the way was cleared for a reassertion of that policy of western conquest which had always had advocates from Themistocles onward in Athens, and was part of the democratic programme.

The tragic fiasco of the Sicilian expedition, involving the death of

In 454 Athens made a treaty with Segesta (inscr. Hicks and Hill, Grecin Hist. Inscr. 34); in 433 with Rhegium and Leontini (Hicks and Hill, 51 and 52; cf. Thuc. iii. 86, ἄγαμος ἀφοίρω μετὰ μὲν Ἀχαῖων τῶν ἵππων); in 444 the colony of Thurii was founded; in 427 (see above) 60 ships were sent to Sicily; and if we may believe Aristophanes (Εἰς 1302) Hyperbolus asked for 100 triremes for Carthage.
of Nicias and the loss of thousands of men and hundreds of ships, was a blow from which Athens never recovered (see under SYRACUSE and SICILY). Even before the final catastrophe the Spartans had reopened hostilities. On the advice of Alcibiades (q.v.), exiled from Athens in 415, they had fortified Decelea in Attica within fifteen miles of Athens. This place not only served as a permanent headquarters for predatory expeditions, but cut off the revenue from the Laurium mines, furnished a ready asylum for runaway slaves, and rendered the transference of supplies from Euboea considerably more difficult (i.e. by the sea round Cape Sunium). Athens thus entered upon the third stage of the conflict with exceedingly poor prospects.

3. The Ionian or Decelean War.—From the Athenian standpoint this war may be broken up into three periods: (1) period of revolt of allies (413-411), (2) the rally (410-408), (3) the relapse (407-404). As contrasted with the Archidamian War, this war was fought almost exclusively in the Aegean Sea, the enemy was primarily Sparta, and the deciding factor was Persian gold. Furthermore, apart from the gradual disintegration of the empire, Athens was disturbed by political strife.

In 412 many Ionian towns revolted, and appealed either to Agis or to the satraps of Euboea, Lesbos, Chios, Erythrae (i.e. Euboea, Lesbos, Chios, Erythrae) led the way in negotiation and revolt, and simultaneously the court of Susa instructed the satraps Pharnabazus and Tissaphernes to renew the collection of tribute from the Greek cities of Asia Minor. The satraps likewise made overtures to Sparta. The revolt of the Ionian allies was due in part to Alcibiades also, whose prompt action in co-operation with his friend the ephor Endius finally confirmed the Chian oligarchs in their purpose. In 411 a treaty was signed by Sparta and Tissaphernes against Athens: the treaty formally surrendered to the Persian king all territory which he or his predecessors had held. It was subsequently renewed in a form somewhat less disgraceful to Greek patriotism by the Spartans Astyochus and Theramenes. On the other hand, a democratic rising in Samos prevented the rebellion of that island, which for the remainder of the war was invaluable to Athens as a stronghold lying between the two great centres of the struggle.

After the news of the Sicilian disaster Athens was compelled to disband the reserve force of 3,000 triremes which had lain untouched in the treasury.¹ The revolt of the Ionian allies, and (in 411) the loss of the Hellespontine, Thracian and Island tributes (see DELLIAN LEAGUE), very seriously crippled her finances. On the other hand, Tissaphernes undertook to pay the Peloponnesian sailors a daily wage of one Attic drachma (afterwards reduced to ½ drachma). In Attica itself Athens lost Oenoe and Oropus, and by the end of 411 only one quarter of the empire remained. In the meanwhile Tissaphernes began to play a double game with the object of wasting the strength of the combatants. Moreover Alcibiades lost the confidence of the Spartans and passed over to Tissaphernes, at whose disposal he placed his great powers of diplomacy, at the same time scheming for his restoration to Athens. He opened negotiations with the Athenian leaders in Samos and urged them to upset the democracy and establish a philo-Persian oligarchy. After elaborate intrigues, in the course of which Alcibiades played false to the conspirators by forcing them to abandon the idea of friendship with Tissaphernes owing to the exorbitant terms proposed, the new government by the Four Hundred was set up in Athens (see THERAMENES). This government (which received no support from the armament in Samos) had a brief life, and on the final revolt of Euboea was replaced by the old democratic system. Alcibiades (q.v.) was soon afterwards invited to return to Athens.

The war, which, probably because of financial trouble, the Spartans had neglected to pursue when Athens was thus in the throes of political convulsion, was now resumed. After much manoeuvring and intrigues a naval battle was fought at Cynos-

¹ She had already abolished the system of tribute in favour of a 5% ad valorem tax on all imports and exports carried by sea between her ports and those of the allies.

² Xenophon, Hell. does not mention it: Thucydides's history had by this time come to an end.
PELOPONNESUS—

the storm, failed to recover the bodies of those of their crews who were drowned or killed in the action. They were therefore recalled, tried and condemned to death, except two who had disobeyed the order to return to Athens.

At this point Lysander was again sent out, nominally as secretary to the official admiral Arcus. Cyrus, recalled to Susa by the illness of Darius, left him in entire control of his satrapy. Thus strengthened he sailed to Lampscus on the Hellespont and laid siege to it. Conon, now in charge of the Athenian fleet, sailed against him, but the fleet was entirely destroyed while at anchor at Aegospotami (Sept. 405). Conon escaping with only 12 out of 180 sail to Cyprus. In April 404 Lysander sailed into the Peiraicus, took possession of Athens, and destroyed the Long Walls and the fortifications of Peiraicus. An oligarchical government was set up (see CRITTERS), and Lysander having compelled the capitulation of Samos, the last Athenian stronghold, sailed in triumph to Sparta.

Two questions of considerable importance for the full understanding of the Peloponnesian War may be selected for special notice: (1) how far was it a war between two antagonistic theories of government—oligarchical and democratic? and (2) how far was Athenian state superiority to Sparta in decline as a result of the offers of peace which Sparta made.

1. A common theory is that Sparta fought throughout the war as an advocate of oligarchy, while Athens did not seek to interfere with the constitutional preferences of her allies. The view is based partly on Thuc. i. 19, according to which the Spartans took care that their allies should be offered a peace on terms dictated by the idea of democracy. This view is disapproved by Thucydides' own narrative, which shows that down to 418 (the battle of Mantinea) Sparta tolerated democratic governments in Peloponnesus itself—e.g. Elis, Mantinea, Sicyon, Achaeia. It was only after that date that democracy was suppressed in the Peloponnesian League, and even then Mantinea remained democratic. In point of fact, it was only when Lysander became the representative of Spartan foreign policy—i.e. in the last years of the war—that Sparta's interest in the decision of the conflict and the question of her own empire, as distinct from her advantages at home, became paramount. The political position of Athens was still such that she could afford to declare for democracy; it was only after 418 that the case of Mantinea (see HICKS and HILL, op. cit. pp. 77) is of little account, because at that time (409) the fusion of the Empire was in extremis. In general we find that Athenian orators take special care on the ground that the Athenian alliance had alienated to her allies the constitutional advantages which they themselves enjoyed.

2. In view of the disastrous issue of the war, it is important to notice that on three occasions—(a) after Pylos, (b) after Cyzicus, (c) after the truce at Mantinea—Sparta proposed to offer peace to Athens. (a) Though Cleon was probably wise in opposing peace negotiations before the capture of the Spartans in Sphacteria, it seems in the light of subsequent events that he was wrong to refuse the truce which was offered after the hoplites had been captured. No doubt, however, the temper in Athens was at that time predominantly warlike, and the surrender of the hoplites was a unique triumph. Possibly, too, Cleon foresaw that peace would have meant a triumph for the phi-lo-Laconian party. (b) The proposals of 410 are given by Diodorus, who says that the ephebus Endius proposed that a peace should be made on the basis of uti possidetis, except that Athens should evacuate Pylos and Cythera and hand over Decelea. Cleon, however, perhaps doubting whether the offer was sincere (cf. PHILOCLEUS in Schol. on Arist. Hellen. Orest. 371; FRAGM. ed. DIDOT, 117, 118), demanded the status quo ante (413 or 431). (c) The proposals of 406, mentioned by ATH. Pol. 34, 4, were the same, or nearly the same, as those of 410. Athens no longer had Pylos and Cythera, and had lost practically all her empire in the Peloponnese. It is possible that peace must therefore have been advantageous to Athens as showing the world that in spite of her losses she was still one of the great powers of Greece. Moreover, an alliance with Sparta would have meant a check to Persia, and a means of intelligence and help to the allied states. The Spartan party interest was a leading motive in Cleon's mind, since a peace would have meant the return of the oligarchical exile and the establishment of a moderate oligarchy.

A. V. lower, "Der Peloponnesische Krieg" is essential. All histories of Greece may be consulted (see GREECE: History, Ancient, section "Authorities").

PELOPONNESUS—PELOTA

("Island of Pelops"), the ancient and modern Greek official name for the part of Greece south of the Isthmus of Corinth. In medieval times it was called the Morea, from its resemblance to a mulberry-leaf in shape, and this name is still current in popular speech.

PELOPS, in Greek legend, the grandson of Zeus, son of Tantalus and Dion, and brother of Niobe. His father's home was on Mt Sipylos in Asia Minor, whence Pelops is spoken of as a Lydian or a Phrygian. Tantalus one day served up to the gods his own son Pelops, boiled and cut in pieces. The gods detected the crime, and none of them would touch the food except Demeter (according to others, Thetis), who, distracted by the loss of her daughter Persephone, ate of the shoulder. The gods restored Pelops to life, and the shoulder consumed by Demeter was replaced by one of ivory. Wherefore the descendants of Pelops had a white mark on their shoulder ever after (Ovid, Metam. vi. 404; VIRGIL, Géorgiques, iii. 7). This tale is perhaps reminiscent of human sacrifice amongst the Greeks. Poseidon carried Pelops off to Olympus, where he dwelt with the gods, till, for his father's sins, he was cast out from heaven. Then, taking much wealth with him, he crossed over from Asia to Greece. He went to Fisa in Elis as suitor of Hippodameia, daughter of king Oenomaus, who had already vanquished in the chariot-race and slain many suitors for his daughter's hand. But by the help of Poseidon, who lent him winged steeds, or of Oenomaus's charioteer Myrtilus, whom he or Hippodameia bribed, Pelops was victorious in the race, wedded Hippodameia, and became king of Fisa (HYGINUS, Fab. 84). The race of Pelops for his wife may be a reminiscence of the early practice of marriage by capture. When Myrtilus claimed his promised reward, Pelops flung him into the sea near Gerasteus in Eubeoa, and from his dying curse sprang those crimes and sorrows of the house of Pelops which supplied the Greek tragedies with such fruitful themes (Sophocles, Electra, 595, with Sophocle's note).

Among the sons of Pelops by Hippodameia were Atreus, Thyestes and Chrysippus. From Fisa Pelops extended his sway over the Moorish Silembria, where he celebrated the Olympic games with a famous oath unknown before. His power and fame were so great that henceforward the whole peninsula was called the Peloponnesus, "island of Pelops" (πελόννησος, island). In after times Pelops was honoured at Olympia above all other heroes; a temple was built for him by Heraclès, his descendant in the fourth generation, in which the annual magistrates sacrificed to him a black ram.

From the reference to Asia in the tales of Tantalus, Niobe and Pelops it has been conjectured that Asia was the original seat of these legends, and that it was only after emigration to Greece that the people localized a part of the tales of Pelops in their new home. In the time of the Persians the throne of Pelops was still shown on the map of Mt Sipylos. The story of Pelops is told in the first Olympic ode of Pindar and in prose by Nicolao Damascenus.

PELOTA (Sp, "little ball," from Lat. pallis, a ball game which, originating centuries ago in the Basque provinces, has developed into several forms of the sport. Epigrams of Martial show that there were at least three kinds of pelota played in his time. Blasid, practically hand fours against the wall of a court, is still played on both sides of the Pyrenees. It is so popular that the authorities had to forbid its being played against the walls of the cathedral at Barcelona. In uncovered courts of large size there are two varieties of pelota. One, the favourite pastime of the Basque, is played against a front wall, either bare-handed, with a leather or wooden long glove-like protector (cesta), or with a chistera strapped to the wrist, a siddle-shaped wicker-work implement three feet long, much like a hansom-wheel basket mud-guard, in the narrow groove of which the ball is caught and from which, thanks to the leverage afforded, it can be hurled with tremendous force. There are several players to a side, frequently an uneven number to allow a handicap. The score is announced by a cantara, whose melodic vocal efforts make him not the least appreciated participant in the game. In the other form of the game, played merely exclusively by professionals (pelotaris), there are usually three players on each side, two forwards and a back, distinguished by a coloured sash or cap. The server (butiere) slips off his chistera to serve, bouncing the ball on the but, a kind of stool, about 30 ft. from the wall, and
striking it low against the wall. The side that wins the toss has the first service. The ball must be replayed by the opposing side at the wall, which it must hit over a line 3 ft. from the base of the wall and under the net fixed at the top of the wall.

The game is counted 15, 30, 40, game, reckoned by the number of faults made by the opposing side. A fault is scored (a) when after the service the ball is not caught on the volley or first bounce, (b) when it does not on the return strike the wall within the prescribed limits, (c) when it goes out of the prescribed limits of the court, (d) when it strikes the net fixed at the top of the court.

The side making the fault loses the service. A game like this has been played in England by Spanish professionals on a court 250 ft. long, against a wall 30 ft. high and 55 ft. wide. The ball used, a trifle smaller than a base-ball, is hard rubber wound with yarn and leather-covered, weighing 5 ounces. The server bounces the ball on the concrete floor quite near the fronton, and hits it with his chistera against the wall with a force to make it rebound beyond a line 80 ft. back. It usually goes treble that distance.

PELOTAS, a city of the state of Rio Grande do Sul, Brazil, on the left bank of the São Gonçalo river near its entrance into the Lagoa dos Patos, about 30 m. N.N.E. of the city of Rio Grande do Sul, and 2,200 m. (mod. 1037 sq. m.), 14,601. The Rio Grande Bagé railway communicates with the city of Rio Grande, and with the railways extending to Bagé, Casequey, Santa Maria, Passo Fundo and Porto Alegre. The São Gonçalo river is the outlet of Lagoa Mirim, and Pelotas is therefore connected with the inland water routes. The city is built on an open grassy plain (campo) little above the level of the lake (28 ft. above sea-level). The public buildings include the church of São Francisco, dating from the early part of the 15th century, the municipal hall, a fine theatre, the Misericordia hospital, a public library containing about 25,000 volumes and a great central market. Pelotas is the centre of the xarque or carne seca (jerked beef) industry of Rio Grande do Sul. In its outskirts and the surrounding country are an immense number of xarqueadas (slaughter-houses), with large open yards where the dressed beef, lightly salted, is exposed to the sun and air. There are many factories or packing houses where the by-products are prepared for market. Pelotas was only a small settlement at the beginning of the 19th century and had no permanent organization until 1812. It became a cidade in 1850 and a city in 1855.

PELOUZE, Théophile Jules (1807–1867), French chemist, was born at Valognes, in Normandy, on the 26th (or 13th) of February 1807. His father, Edmond Pelouze (d. 1847), was an industrial chemist and the author of several technical handbooks. The son, after spending some time in a pharmacy at La Fère, acted as laboratory assistant to Gay-Lussac and J. L. Lassaigne (1800–1850) at Paris from 1827 to 1829. In 1830 he was appointed associate professor of chemistry at Lille, but returning to Paris next year became répétiteur, and subsequently professor, at the École Polytechnique. He also held the chair of chemistry at the Collège de France, and in 1833 became assayer to the mint and in 1848 president of the Commission des Monnaies. After the coup d’état in 1851 he resigned his appointments, but continued to conduct a laboratory-school he had started in 1846. He died in Paris on the 1st of June 1867. Though Pelouze made no discovery of outstanding importance, he was a busy investigator, his work including researches on salicin, on beetroot sugar, on various organic acids—gallic, malic, tartaric, butyric, lactic, &c.—on oenanthic ether (with Liebig), on the nitroso phosphates, on gun-cotton, and on the composition and manufacture of glass.

He also carried out determinations of the atomic weights of several elements, and with E. Frémy, published Traité de chimie générale (1847–1850); Abrégé de chimie (1848); and Notions générales de chimie (1853).

PELTER, Jean Charles Athanase (1785–1845), French physicist, was born at Ham (Somme) on the 22nd of February 1785. He was originally a watchmaker, but retired from business about the age of thirty and devoted himself to experimental and observational science. His papers, which are numerous, are devoted in great part to atmospheric electricity, water-pots, cyanometry and polarization of skylight, and the temperature of water in the spherical state, and the boiling-point at great elevations. There are also a few devoted to curious points of natural history. But his name will always be associated with the thermal effects at junctions in a voltaic circuit. His great experimental discovery, known as the "Pelletier effect," was that if a current pass from an external source through a circuit of two metals it cools the junction through which it passes in the same direction as the thermo-electric current which would be caused by directly heating that junction, while it heats the other junction (see Thermo-Electricity). Pelletier died in Paris on the 27th of October 1845.

PELTUINUM [mod. Civita Ansidonia], a town of the Vestini, on the Via Claudia Nova, 12 m. E.S.E. of Aquila. It was apparently the chief town of that portion of the Vestini who dwelt west of the main Appennine chain. Remains of the town walls, of an amphitheatre, and of other buildings still exist.

PELUSIUM, an ancient city and port of Egypt, now represented by two large mounds close to the coast and the edge of the desert, 20 m. E. of Port Said. It lay in the marshes at the mouth of the most easterly (Pelusiac) branch of the Nile, which has since been diverted into the land towards Syria and a strong fortress, which, from the Persian invasion at least, played a great part in all wars between Egypt and the East. Its name has not been found on Egyptian monuments, but it may be the Sin of the Bible and of Assur-bani-pal's inscription. Pelusium ("the muddy") is the Farama of the Arabs, Pervom in Coptic; the name Tnq which clings to the locality seems etymologically connected with the Arabic word for clay or mud. The site, crowned with extensive ruins of burnt brick of the Byzantine or Arab period, has not yielded any important remains.

PELVIS (Lat. for "basin," "Gr. ρέλανος"). In anatomy, the bony cavity at the lower part of the abdomen in which much of the genito-urinary apparatus and the lower part of the bowels are contained (see Skeleton, § Appendicular).

PEMBA, an island in the Indian Ocean off the east coast of Africa, forming part of the sultanate of Zanzibar. Pemba lies 30 m. N.N.E. of Zanzibar island between 4° 50′ and 5° 30′ S., and 39° 50′ and 40° 30′ E. It is about 40 m. long and 15 m. wide at its broadest part and has an area of 380 sq. km. It is of coraline formation. On the side facing the mainland the coast is much indented. From its luxuriant vegetation it gets its Arabic name of Al-huther—"The Green." The interior is diversified by hills, some of which exceed 600 ft. The land is chiefly owned by great Arab proprietors, who work their plantations with Swahili labour, and with negroes from the mainland. Prior to 1897 the labourers were all slaves. Their gradual manumission was accomplished without injury to the prosperity of the island. The population is estimated at between 50,000 and 60,000, of whom 2000 to 3000 are Arabs. Most of the inhabitants are of Bantu stock, and are known as Wapemba. In the ports there are many Hindu traders and a few Europeans. The plantations are nearly all devoted to coco-nuts (the annual average output being 10,000,000 lb) and coco-nut palms (for the preparation of copra). The number of coco-nut plantations is very small compared with those devoted to coco-nuts. Yet coco-nuts need much care and attention and yield small profit, while the coco-nut palm yields a fairly uniform crop of nuts and will grow almost anywhere. The preponderance of clove plantations dates from a cyclone which in 1872 destroyed nearly all the clove-trees in the island of Zanzibar. Thereupon, to benefit from the great rise in the price of cloves, the Pemba planters cut down their palms and planted cloves. The value of the cloves exported in 1907 was £33,900, or 92% of the total exports. India, Germany and Great Britain are, in the order named, the chief purchasers. Other exports include fire-wood, skins and hides, mother-of-pearl, wax and small quantities of rubber, cowries, tortoiseshell and so-called tortoise-nail. The "tortoise-nail" is the valve with which a shell-fish closes its shell. The Llandolphia rubber-vine is indigenous, and since 1906 Ceara rubber-trees have been
extensively planted. Rice, the chief of Pembroke's imports, could easily be grown on the island. Cotton cloths (Kanga) form the next most considerable item in the imports.

Pembroke has three ports, all on the west side of the island. Shaki-Shaki, the capital and the centre of trade, is centrally situated at the head of a shallow tidal creek partly blocked by dense growths of mangroves. Mkoani is on the south-west coast, Kishi-Kashi on the north-west coast; at the last-named port there is a deep and well-sheltered harbour, approached however by a narrow and dangerous channel.

Pemba is administered as an integral part of the Zanzibar dominions, and yields a considerable surplus to the exchequer, mainly from a 25% duty imposed on cloves exported. There is a weekly steamship service to Zanzibar, and in 1907 the two islands were connected by wireless telegraphy (see ZANZIBAR).

PEMBROKE, EARLS OF. The title of earl of Pembroke has been held successively by several English families, the jurisdiction and dignity of a palatine earldom being originally attached to it. The first creation dates from 1138, when the earldom of Pembroke was conferred by King Stephen on Gilbert de Clare (d. 1148), son of Gilbert Fitz-Richard, who possessed the lordship of Strigul (Estrighoiel, in Domesday Book), the modern Cheswick. After the battle of Lincoln (1141), in which he took part, he helped the party of the empress Matilda, and he married Henry I's mistress, Isabel, daughter of Robert de Beaumont, earl of Leicester.

Richard de Clare, 2nd earl of Pembroke (d. 1176), commonly known as "Strongbow," son of the first earl, succeeded to his father's estates in 1148, but had forfeited or lost them by 1168. In that year Dermot, king of Leinster, driven out of his kingdom by Roderick, king of Connaught, came to solicit help from Henry II. He secured the services of Earl Richard, promising him the hand of his daughter Eva and the succession to Leinster. The earl crossed over in person (1170), took both Waterford and Dublin, and was married to Eva. But Henry II, jealous of this success, ordered all the troops to return by Easter 1171. In May Dermot died; this was the signal of a general rising, and Richard barely managed to keep Roderick of Connaught out of Dublin. Immediately afterwards he hurried to England to solicit help from Henry II, and surrendered to him all his lands and castles. Henry crossed over in October 1172; he stayed in Ireland six months, and put his own men into nearly all the important places, Richard keeping only Kilmany. In 1173 he went in person to France to help party of the empress Matilda, and he married Henry I's mistress, Isabel, daughter of Robert de Beaumont, earl of Leicester.

Early in 1176 Richard died, just as Raymond had taken Limerick for him. Strongbow was the statesman, as the FitzGeralds were the soldiers, of the conquest. He is vividly described by Giralda Cambrensis as a tall and fair man, of pleasing appearance, modest in his bearing, delicate in features, of a low voice, but sage in council and the idol of his soldiers. He was buried in the cathedral church of Dublin, where his effigy and that of his wife are still preserved.

See Giralda Cambrensi, Expugnatio hibernica; and the Song of Dermot, edited by G. H. Orpen (1892).

Strongbow being died without male issue, his daughter Isabel became countess of Pembroke in her own right, and the title was borne by her husband, Sir William Marshal, of Le Marchal, second son of John le Marchal, by Sibylle, the sister of Patrick, earl of Salisbury. John le Marchal was a partisan of the empress Matilda, and died about 1164.

The death of Sir William Marshal's eldest son was a great loss, but his parents were married not earlier than 1145 and he was a mere child in 1152, when he attracted the notice of King Stephen. In 1170 he was selected for a position in the household of Prince Henry, the heir-apparent, and remained there until the death of his young patron (1183). He undertook a pilgrimage to the Holy Land, where he served as a crusader with distinction for two years. Although he had abetted the prince in rebellion he was pardoned by Henry II. and admitted to the royal service about 1188. In 1189 he covered the flight of Henry II. from Le Mans to Chinon, and, in a skirmish, unhorsed the unctuous Richard Cœur de Lion. None the less Richard, on his accession, promoted Marshal and confirmed the old king's licence for his marriage with the heiress of Strigul and Pembroke. This match gave Marshal the rank of an earl, with great estates in Wales and Ireland, and he was included in the council of regency which the king appointed on his departure for the third crusade (1190). He took the side of Prince John when the latter expelled the justiciar, William Longchamp, from the kingdom, but he soon discovered that the interests of John were different from those of Richard. Hence in 1193 he joined with the loyalists in making war upon the prince. Richard forgave Marshal his first error of judgment, allowed him to succeed his brother, John Marshal, in the hereditary marshallship, and on his death-bed designated him as custodian of Rouen and of the royal treasure during the interregnum. Though he quarrelled more than once with John, Marshal was one of the few English laymen who clung to the royal side through the Barons' War. He was one of John's executors, and was subsequently elected regent of the king and kingdom by the royalist barons in 1216. In spite of his advanced age he prosecuted the war against Prince Louis and the rebels with remarkable energy. In the battle of Lincoln (May 1217) he was chief of the army at the head of the young soldiers, and he was preparing to besiege Louis in London when the war was terminated by the naval victory of Hubert de Burgh in the straits of Dover. He was criticized for the generosity of the terms he accorded to Louis and the rebels (September 1217); but his desire for an expeditious settlement was dictated by sound statesmanship. Self-restraint and compromise were the key-notes of Marshal's policy. Both before and after the peace of 1217 he reissued Magna Carta. He fell ill early in the year 1219, and died on the 14th of May at his manor of Caversham near Reading. He was succeeded in the regency by Hubert de Burgh, in his earldom by his five sons in succession.

Marshall's eldest son, William Marshal (d. 1231), 2nd earl of Pembroke of this line, passed some years in warfare in Wales and in Ireland, where he was justiciar from 1224 to 1226; he also served in France II. He was the second wife of the king's sister, Eleanor, afterwards the wife of Simon de Montfort, but he left no children. His brother Richard Marshal (d. 1234), 3rd earl, came to the front as the leader of the baronial party, and the chief antagonist of the foreign friends of Henry III. Fearing treachery he refused to visit the king at Gloucester in August 1233, and Henry declared him a traitor. He crossed to Ireland, where Peter des Roches had instigated his enemies to attack him, and in April 1234 he was overpowered and wounded, and died a prisoner. His brother Gilbert (d. 1241), who became the 4th earl, was a friend and ally of Richard, earl of Cornwall. When another brother, Anselm, the 6th earl, died in December 1245, the male descendants of the great earl marshal became extinct. The extensive family possessions were now divided among Anselm's five sisters and their descendants, the earldom of Pembroke reverting to the Crown.

The next holder of the lands of the earldom of Pembroke was William de Valence (d. 1296), a younger son of Hugh de Lusignan, count of La Marche, by his marriage with Isabella of Angoulême (d. 1240), widow of the English king John, and was born at Aachen, near Lusignan. In 1247 William and his brothers, Guy and Hubert, crossed over to England at the invitation of their half-brother, Henry III. In 1250 Aymer (d. 1260) was elected bishop of Winchester, and in 1247 Henry arranged a marriage between William and Joan de Munchensi (d. 1207) a grand-daughter of William Marshal, 1st earl of Pembroke. The custody of Joan's property, which included the castle and lordship of Pembroke, was entrusted to her husband, who in 1295 was summoned to parliament as earl of Pembroke. In South Wales...
Valence tried to regain the palatine rights which had been attached to the earldom of Pembroke. But his energies were not confined to South Wales. Henry III. amassed lands and honours upon him, and he was soon thoroughly hated as one of the most prominent of the rapacious foreigners. Moreover, some trouble in Wales led to a quarrel between him and Simon de Montfort, and this soon grew more violent. He would not comply with the provisions of Oxford, and took refuge in Wolseye Castle at Winchester, where he was besieged and compelled to surrender and leave the country. In 1259 he and Earl Simon were formally reconciled in Paris, and in 1261 he was again in England and once more enjoying the royal favour. He fought for Henry at the battle of Lewes, and then, after a stay in France, he landed in Pembrokeshire, and took part in 1265 in the siege of Gloucester and the battle of Evesham. After the royalist victory he was restored to his estates and accompanied Prince Edward, afterwards Edward I., to Palestine. He went several times to France on public business; he assisted in the conquest of North Wales; and he was one of Edward's representatives in the famous suit over the succession to the crown of Scotland in 1291 and 1292. He died at Bayonne on the 13th of June 1296, his body being buried in Westminster Abbey. His eldest surviving son, Aymer (c. 1265-1324), succeeded to his father's estates, but was not formally recognized as earl of Pembroke until after the death of his mother Joan about 1307. He was appointed guardian of Scotland in 1306, but with the accession of Edward II. to the throne and the consequent rise of Piers Gaveston to power, his influence sensibly declined; he became prominent among the discontented nobles and was one of those who were appointed to select the lord ordainers in 1311. In 1312 he captured Gaveston at Scarborough, giving the favour a promise that his life should be spared. Ignoring this undertaking, however, Guy Beauchamp, earl of Warwick, put Gaveston to death, and consequently Pembroke left the allied lords and attached himself to Edward II. Valence was present at Bannockburn; in 1317, when returning to England from Rome, he was taken prisoner and was kept in Germany until a large ransom was paid. In 1318 he again took a conspicuous part in making peace between Edward and his nobles, and in 1322 assisted at the formal coronation of Earl Thomas of Lancaster, and received some of his lands. His wife, Mary de Chatillon, a descendant of King Henry III., was the founder of Pembroke College, Cambridge.

In 1330 Laurence, Lord Hastings (d. 1348), a great-grandson of William de Valence, having inherited through the female line a portion of the estates of the Valence earls of Pembroke was created, or recognized as, earl of Pembroke. His son John (d. 1361), married Margaret Plantagenet, daughter of King Edward III., and on the death without issue of his grandson in 1389 the earldom of Pembroke reverted again to the Crown, while the barony of Hastings became dormant and so remained till 1840.

In 1414 Humphrey Plantagenet, fourth son of King Henry IV., was created duke of Gloucester and earl of Pembroke for life, these titles being subsequently made hereditary, with a reversion as regards the earldom of Pembroke, in default of heirs to Humphrey, to William de la Pole, earl of Suffolk. Accordingly, on the death of Humphrey, without issue, in 1447 this nobleman became earl of Pembroke. He was beheaded in 1450 and his titles were forfeited. In 1453 the title was given to Sir Jasper Tudor, half-brother of King Henry VI. Sir Jasper being a Lancastrian, his title was forfeited during the pre-eminence of the house of York, but was restored on the accession of Henry VII. On his death without heirs in 1495, his title became extinct.

During his attainder Sir Jasper was taken prisoner by Sir William Herbert (d. 1460), a zealous Yorkist, who had been raised to the peerage as Baron Herbert by Edward IV., and for this service Lord Herbert was created earl of Pembroke in 1468. His son William (d. 1501) received the earldom of Huntingdon in lieu of that of Pembroke, which he surrendered to Edward IV., who thereupon conferred it (1479) on his son Edward, prince of Wales; and when this prince succeeded to the throne as Edward V., the earldom of Pembroke merged in the crown.

Anne Boleyn, a few months previous to her marriage with Henry VIII., was created marchioness of Pembroke in 1532. It is doubted by authorities on peerage law whether the title merged in the royal dignity on the marriage of the marchioness to the king, or became extinct on her death in 1536.

The title of earl of Pembroke was next revived in favour of Sir William Herbert (c. 1501-1570), whose father, Richard, was an illegitimate son of the 1st earl of Pembroke of the house of Herbert. He had married Anne Parr, sister of Henry VIII.'s sixth wife, and was created earl in 1551. The title has since been held by his descendants.

An executor of Henry VIII.'s will and the recipient of valuable grants of land, Herbert was a prominent and powerful personage during the reign of Edward VI., both the protector Somerset and his rival, John Dudley, afterwards duke of Northumberland, angling for his support. He threw in his lot with Dudley, and after Somerset's fall obtained some of his lands in Wiltshire and a peerage. It has been asserted that he devised the scheme for settling the English crown on Lady Jane Grey; at all events he was one of her advisers during her short reign, but he declared for Mary when he saw that Lady Jane's cause was lost. By Mary and her friends Pembroke's loyalty was at times suspected, but he was employed as governor of Calais, as president of Wales and in other ways. He was also to some extent in the confidence of Philip II. of Spain. The earl retained his place at court under Elizabeth until 1569, when he was suspected of favouring the projected marriage between Mary, queen of Scots, and the duke of Norfolk. Among the monastic lands granted to Herbert was the estate of Wilton, near Salisbury, still the residence of the earls of Pembroke.

His eldest son Henry (c. 1534-1601), who succeeded as and earl, was president of Wales from 1586 until his death. He married in 1557 Mary Sidney, the famous countess of Pembroke (c. 1561-1621), third daughter of Sir Henry Sidney and his wife Mary Dudley. Sir Philip Sidney to whom she was deeply attached through life, was her eldest brother. Sir Philip Sidney spent the summer of 1580 with her at Wilton, or at Ivecourt, a favourite retreat of hers in the neighbourhood. Here at her request he began the Countess of Pembroke's Arcadia, which was intended for her pleasure alone, not for publication. The two also worked at a metrical edition of the Psalms. When the great sorrow of her brother's death came upon her she made herself his literary executor, correcting the unauthorized editions of the Arcadia and of his poems, which appeared in 1590 and 1591. She also undertook under her patronage the poets who had looked to her brother for protection. Spenser dedicated his Ruines of Time to her, and refers to her as Urania in Colin Clout's come home again; in Spenser's Astrophel she is "Clorinda." In 1599 Queen Elizabeth was her guest at Wilton, and the countess composed for the occasion a pastoral dialogue in praise of Astraea. After her husband's death she lived chiefly in London at Crosby Hall, where she died.

The Countess's other works include: A Discourse of Life and Death, translated from the French of Plessis du Mornay (1593), and Antioch (1602), a version of a tragedy of Robert Garnier.

William Herbert, 3rd earl of Pembroke (1580-1630), son of the 2nd earl and his famous countess, was a conspicuous figure in the society of his time and at the court of James I. Several times he found himself opposed to the schemes of the duke of Buckingham, and he was keenly interested in the colonization of America. His son, Sir Walter, created Viscount of the Forest, married Anne, daughter of Sir Robert Bruce of Turnhouse in 1615 to 1625 and lord steward from 1626 to 1630. He was chancellor of the University of Oxford in 1624 when Thomas Tesdale and Richard Wightwick refounded Broadgates Hall and named it Pembroke College in his honour. By some Shakespearian commentators Pembroke has been identified with the "Mr W. II." referred to as "the onlie begetter" of Shakespeare's sonnets in the dedication by Thomas Thorpe, the owner of the published manuscript, while his mistress, Mary Fitten (q.v.), has been identified with the "dark lady" of the sonnets. In both
cases the identification rests on very questionable evidence (see Shakespeare, William). He and his brother Philip are the "incomparable pair of brethren" to whom the first folio of Shakespeare is inscribed. The earl left no sons when he died in London on the 10th of April 1630. Clarendon gives a very eulogistic account of Pembroke, who appears, however, to have been a man of weak character and dissolute life. Gardiner describes him as the Hamlet of the English court. He had literary tastes and wrote poems; one of his closest friends was the poet Donne, and he was generous to Ben Jonson, Massinger and others.

His brother, Philip Herbert, the 4th earl (1584-1650), was for some years the chief favourite of James I, owing this position to his comely person and his passion for hunting and for field sports generally. In 1605 the king created him earl of Montgomery and Baron Herbert of Shurland, and since 1630, when he succeeded to the earldom of Pembroke, the head of the Herbert family has carried the double title of earl of Pembroke and Montgomery. Although Philip's quarrelsome disposition often led him into trouble he did not forfeit the esteem of James I, who heaped lands and offices upon him, and he was also trusted by Charles I, who made him lord chamberlain in 1626 and frequently visited him at Wilton. He worked to bring about peace between the king and the Scots in 1630 and 1640, but when in the latter year the quarrel between Charles and the English parliament was renewed, he deserted the king who soon deprived him of his office of chamberlain. Trusted by the popular party, Pembroke was made governor of the Isle of Wight, and he was one of the representatives of the parliament on several occasions, notably during the negotiations at Uxbridge in 1645 and at Newport in 1648, and when the Scots surrendered Charles in 1647. From 1641 to 1643, and again from 1647 to 1650, he was chancellor of the university of Oxford; in 1648 he removed some of the heads of houses from their positions because they would not take the solemn league and covenant, and his foul language led to the remark that he was more fitted "by his eloquence in swearing to preside over Bedlam than a learned academy." In 1649, although a peer, he was elected and took his seat in the House of Commons as member for Berkshire, this "ascent downwards" calling forth many satirical writings from the royalist wits. The earl was a great collector of pictures and had some taste for architecture. His eldest surviving son, Philip (1621-1669), became 5th earl of Pembroke, and 2nd earl of Montgomery; he was twice married, and was succeeded in turn by three of his sons, of whom Thomas, the 8th earl (c. 1656-1733), was a person of note during the reigns of William III and Anne. From 1690 to 1692 he was first lord of the admiralty; then he served as lord privy seal until 1699, being in 1697 the first plenipotentiary of Great Britain at the court of Louis XIV of France. On two occasions he was lord high admiral for a short period; he was also lord president of the council and lord-lieutenant of Ireland, while he acted as one of the lords justices seven times; and he was president of the Royal Society in 1689-1690. His son Henry, the 9th earl (c. 1689-1750), was a soldier, but was better known as the "architect earl." He was largely responsible for the erection of Westminster Bridge. The title descended directly to Henry, 10th earl (1734-1794), a soldier, who wrote the Method of Breeding Horses (1762); George Augustus, 11th earl (1750-1827), an ambassador extraordinary to Vienna in 1807; and Robert Henry, 12th earl (1791-1862), who died without issue. George Robert Charles, the 13th earl (1850-1895), was a grandson of the 11th earl and a son of Baron Herbert of Lea (q.v.), whose second son Sidney (b. 1853) inherited all the family titles at his brother's death.

Pembroke is a town of Ontario, capital, Canada of Renfrew county, 74 m. N.W., of Ottawa by rail on the south shore of Allumette Lake, an expansion of the Ottawa river, and on the Canadian Pacific and Canadian Atlantic railways. Pop. (1901), 5156. It is the seat of a Roman Catholic bishopric, an important centre in the lumber trade, and contains saw, grist and woollen mills, axe factory, &c. The Muskrat river affords excellent water-power.

Pembroke (Penfro), an ancient municipal borough, a contributory parliamentary borough and county-town of Pembroke, Wales, situated on a narrow peninsula at the head of the Pennar tidal inlet or "pil" of Milford Haven. Pop. (1901), 4487; together with Pembroke Dock 15,853. Pembroke is a station on the South Wales system of the Great Western railway. The old-fashioned town, consisting chiefly of one long broad street, retains portions of its ancient walls. A large mill-dam is a conspicuous feature on the north of the town. St Mary's church in the centre of the town possesses a massive tower of the 12th century. Near the ruined West Gate is the entrance to Pembroke Castle, a splendid specimen of medieval fortified architecture. The circular vaulted keep erected by Earl William Marshal (c. 1250), remains almost intact. Close to the keep stands the ruined chamber wherein, according to local tradition, Henry VII. was born in 1457. Beneath the fine banqueting hall, a flight of steps descends into "the Wogan," a vast subterranean chamber giving access to the harbour. Facing the castle, on the western side of the pill, stand the considerable remains of Monkton Priory, a Benedictine house founded by Earl William Marshal as a cell to the abbey of Sées or Sayes in Normandy, but under Henry VI. transferred to the abbey of St Albans. The priory church, now the parish church of the suburb of Monkton, contains monuments of the families of Mervick of Bush and Owen of Oriolton. St Daniel's chapel forms a prominent landmark on the ridge south of the town.

Pembroke Dock (formerly known as Pater, or Patershuch), a naval dockyard and garrison town, is situated close to Hob's Point, at the eastern extremity of Milford Haven. It forms the Pater Ward of Pembroke, from which it is distant 2 m. to the north-west. The place owes its origin to the decision of the government in 1814 to form a naval dépôt on Milford Haven. The dockyard, enclosed by high walls and covering 80 acres, is protected by a powerful fort—the construction and repairing of ironclads is extensively carried on here. There is a submarine dépôt at Pennar Gut, and also accommodation for artillery and infantry. Ferry boats ply frequently between Pembroke Dock and Neyland on the opposite shore of the Haven.

Pembroke is probably an Anglo-Norman form of the Cymric Penfro, the territory lying between Milford Haven and the Bristol Channel, now known as the Hundred of Castlemartin. During the invasion of South Wales under William Rufus, Arnulf de Montemerti, fifth son of Roger earl of Shrewsbury, seems to have erected a fortress of stone (c. 1090) on the site of the castle. The first castellan of this new stronghold was Giraldo de Windsor, husband of the Princess Nest of South Wales and grandfather of Giraldo Cambrensis. Throughout the 12th and 13th centuries the castle was strengthened and enlarged under successive earls palatine of Pembroke, who made this fortress their chief seat. As the capital of the palatinate and as the nearest port for Ireland, Pembroke was in Plantagenet times one of the most important fortified cities in the kingdom. The town, which had grown up under the shadow of the almost impregnable castle, was first incorporated by Henry I. in 1100 and again by Earl Richard de Clare in 1154 (who also encircled the town with walls), and these privileges were confirmed and extended under succeeding earls palatine and kings of England. In 1835 the corporation was remodelled under the Municipal Corporations Act. Henry II. occasionally visited Pembroke, notably in 1172, and until the close of the Wars of the Roses, both town and castle played a prominent part in the history of Britain. With the passing of the Act of Union of Wales and England in 1536 however, the jura regalia of the county palatine of Pembroke were abolished, and the prosperity of the town began to decline. Although acknowledged as the county town of Pembroke, Pembroke was superseded by Haverfordwest as the judicial and administrative centre of the shire on account of the more convenient position of the latter place. By the act of 1536 Pembroke was declared the leading borough in the
the limestone appears again farther south at Pembroke, Caldy Island and St Gowan's Head; most of the remaining ground about Milford being occupied by Old Red Sandstone with infolded strips of Silurian. A fairly large tract of blown-sand occurs in Pembrey Bay south of Milford Haven. Silver-bearing lead has been mined at Llanynach.

Climate and Industries.—The climate is everywhere mild, and in the sheltered valleys near the coast sub-tropical vegetation flourishes in the open air. In the south the rainfall is small, and the districts round Pembroke suffer from occasional droughts. The chief industry is agriculture, wherein stock-raising is preferred to the growing of cereals. Of cattle the long-horned, jet-black Castlemartin breed is everywhere conspicuous. South Pembroke has long been celebrated for its horses, which are bred in great numbers by the farmers. The deep-sea fisheries of Tenby and Milford are valuable; and fresh fish of good quality is exported by rail to the large towns. Oysters are found at Langwm and near Tenby; lobsters and crabs abound on the western coast. The South Wales coalfield extends into south Pembroke, and coal is worked at Saundersfoot, Begelly, Templeton, Kilgetty and other places. There are slate quarries at Glogau, Cilgerran and elsewhere, and copper has been worked near St Davids, and lead at Llanynach.

Communications.—The South Wales branch of the Great Western railway enters Pembroke from the east near Clynderwen Junction, whence the main line leads to Fishguard Harbour with its important Irish traffic. Other lines proceed to Neyland and Milford Haven by way of Haverfordwest, and a branch line from Fishguard to Goodwick joins the main line at Letterston. The Whitland-Cardigan branch traverses the north-east by way of Crymmych and Cilgerran. Another line running south-west from Whitland proceeds by way of Narberth and Tenby to Pembroke Dock.

Population and Administration.—The area of Pembroke is 305,151 acres with a population in 1891 of 89,138 and in 1901 of 88,732, showing a slight decrease. The municipal boroughs are Pembroke (pop. 13,817), Haverfordwest (6,000), and Tenby (4,400). The hamlet of Bridgend and a part of St Dogmell's parish are included within the municipal limits of Cardigan. Newport (Trêfdraeth) (1,222), the chief town of the barony of Kemes, or Cemaeas, still possesses a mayor and corporation under a charter granted in 1215 by Sir Nicholas Martine, lord of Kemes, whose hereditary representative still nominates the mayor and aldermen, but its surviving municipal privileges are practically honorary. Milford Haven (5,102), Narberth (1,070) and Fishguard (200) are urban districts. Other towns are St Davids (1,710), St Dogmells (Llanduchod) (1,286) and Cligerran (1,058). Pembrokeshire lies in the South Wales circuit, and assizes are held at Haverfordwest. Two members are returned to parliament; one for the county, and one for the united boroughs of Pembroke, Haverfordwest, Tenby, Fishguard, Narberth, Neyland, Milford and Wiston (Castell Gwy). Ecclesiastically, the county contains 153 parishes and lies wholly in the diocese of St Davids.

History.—Pembroke, anciently known to the Welsh as Dyfed, was originally comprised in the territory of the Dimetiae, conquered by the Romans. During the 6th century St David, or Dei Sant, moved the chief seat of South Welsh monastic and ecclesiastical life from Caerleon-on-Usk to his native place Menevia, which, known in consequence as Tyddewi, or St Davids, continued a centre of religious and educational activity until the Reformation, a period of 1000 years. On the death of Rhodri Mawr in 877, Dyfed fell nominally under the sway of the princes of Deheubarth, or South Wales; but their hold was never very secure, nor were they able to protect the coast towns from the Scandinavian pirates. In 1061 William the Conqueror penetrated west as far as St Davids, where he is said to have visited St David's shrine as a devout pilgrim. The town of Pembroke was united with the see of St David in 1147, and the see of Pembroke did homage to the king for the Welsh lands of Dyfed. With the building of Pembroke Castle, of which Gerald de Windsor was appointed castellan, the Normans began to spread over southern Dyfed; whilst Martin de Tours, landing in Fishguard
Bay and building the castle of Newport at Trêdraeth, won for himself the extensive lordship of Kemes (Cemaeas) between the river Teifi and the Preseli Mountains. The systematic planting of Flemish settlers in the hundred of Rhôs, or Roose, in or about the years 1106, 1108 and 1111 with the approval of Henry I, and again in 1156 under Henry II, marks an all-important episode in the history of Pembrokeshire. The castles of Haverfordwest and Tenby were now erected to protect these aliens, and despite the fierce attacks of the Welsh princes their domain grew to be known as “Little England beyond Wales,” a district whereof the language, customs and people still remain characteristic. In 1128 Gilbert de Clare, having previously obtained Henry I's permission to enjoy all lands he might win for himself in Wales, was created earl of Pembroke in Stephen's reign with the full powers of an earl palatine in Dyfed. The devolution of this earldom is dealt with in a separate article.

In 1536, by the Act of Union (27 Henry VIII.), the king abolished all special jurisdiction in Pembrokeshire, which he placed on an equal footing with the remaining shires of Wales, while its borders were enlarged by the addition of Kemes, Dewisland and other outlying lordships. By the act of 1536 the county returned to parliament one knight for the shire and twoburgesses; one for the Pembroke boroughs and one for the town and county of Haverfordwest, both of which since 1285 have been merged in the Pembroke-and-Haverfordwest parliamentary division. The Reformation deprived the county of the presence of the bishops of St Davids, who on the partial dismantling of the old episcopal palace at St Davids removed their chief seat of residence to Abergwilly, near Carmarthen. Meanwhile the manor of Lamphey was granted to the family of Devereux, earls of Essex, and other episcopal estates were alienated to court favourites, notably to Sir John Perrot of Haroldstone (1517-1592), afterwards lord-deputy of Ireland. During the Civil Wars the forces of the parliament, commanded by Colonel Llwydarm and Sir George Bell, ravaged the royal for- 

tests at Narberth, Tenby, Newport, Wiston, Benton, Upton and Cilgerran. There are some remains of monastic houses at Tenby and Pembroke, but the most important religious communities were the priory of the Augustine friars at Haverfordwest and the abbey of the Benedictines at St Dogmells. Of this latter house, which was founded by Martin de Tours, first lord of Kemes, at the close of the 11th century, and who owned the priories of Pill and Caldy, considerable ruins exist near the west bank of the Teifi about 1 m. below Cardigan. Of the ancient preceptory of the Knights of St John at Slebech scarcely a trace remains, but of the college of St Mary at St Davids founded by Bishop Houghton in 1377, the shell of the chapel survives in fair preservation. Pembrokeshire contains an unusually large number of county seats, particularly in the south, which includes Stackpole Court, the residence of Earl Cawdor, a fine mansion erected in the 18th century; Picton Castle; Slebech, once the seat of the Barons of Picton, although belonging to the Owens; and Ffynone, the residence of the Colby family.

The division of Pembrokeshire ever since the 12th century into well-defined Englishly and Welshy has produced two distinct sets of languages and customs within the county. Roughly speaking, the English division, the Anglia Transsilvania of Camden, occupies the south-eastern half and comprises the hundreds of Roose, Castlemartin, Narberth and Dundleddy. In the Welshy, which includes the hundreds of Dewisland and Cilgerran together with the old barony of Kemes, the language, customs, manners and folk-lore of the inhabitants are almost identical with those of Cardigan and Carmarthenshire. The old Celtic game of Knaps, a pastime partaking of the nature both of football and hockey, in which whole parishes and even hundreds were wont to take an active part, was prevalent in the barony of Kemes so late as the 16th century, as George Owen of Henllys, the historian and antiquary, records; and the Tivy lingered on after Owen's day. Amongst the settlers of the Welshy, who are of mingled Anglo-Saxon, Flemish, Welsh and perhaps Scandinavian descent, many interesting superstitions and customs survive. The English spoken by these dwellers in “Little England beyond Wales” contains many curious idioms and words and the pronunciation of some of the vowels is peculiar. Certain picturesque customs, many of them dating from pre-Reformation times, are still observed, notably in the neighbourhood of Tenby. Such are the sprinkling of persons with dewy evergreens on New Year's morning; the procession of the Cutty Wren on St Stephen's day, and the constructing of little huts at Lannamastile by the farm boys and girls. As early as the opening years of the 19th century, cripples and opthalmic patients were in the habit of visiting the ancient hermitage at St Gowan's Head to bathe in its sacred well; and Richard Fenton, the county historian alludes (c. 1858) to many crutches left at St Gowan's chapel by grateful devotees. Belief in ghosts, fairies, witches, &c., is still prevalent in the more remote places, and the dress of the fishwives of Langwm near Haverfordwest is highly picturesque with its short skirt, scarlet shawl and buckled shoes.
PENNIGAN—PEN

 Authorities.—Richard Fenton, A Historical Tour through Pembroke (London, 1810); Edward Law, History of Little England beyond Wales (London, 1885); Basil Jones and E. A. Freeman, History and Antiquities of St David's (London, 1856), etc.

PENNIGAN, a North American Indian (Cree) word for a meat prepared in such a way as to contain the greatest amount of nourishment in the most compact form. As made by the Indians it was composed of the lean parts of the meat, dried in the sun, rubbed or shredded and mixed with melted fat. It is flavoured with acid berries. If kept dry it will keep for an indefinite time, and is thus particularly serviceable in arctic or other explorations.

PENGIS (Gr. πυρός, a bubble), a skin disease, in which large blebs appear, on a red base, containing a clear or yellowish fluid; the blebs occasion much irritation, and when they burst leave raw ulcerated surfaces. The disease is principally known in unhealthy or neglected children. A variety of the malady, pennisous foliaceus, affects the whole body, and gradually proves fatal. Pemphigus of an acute septicamia type occurs in butchers or those who handle hides, and a diplococcus has been isolated by William Bullock. The treatment is mainly constitutional, by means of good nourishment, warm baths, local sedatives and tonics. In chronic pemphigus, streptococci have been found in the blebs, and the opsonic index was low to streptococci. Improvement has been known to take place on the injection of a vaccine of streptococci.

PEN (Lat. penne, a feather, pen), an instrument for writing or for forming lines with an ink or other coloured fluid. The English word, as well as its equivalents in French (plume) and in German (Feder), originally means a wing-feather, but in ancient times the implements used for producing written characters were not quills. The earliest writing implement was probably the stilius (Gr. γραφής), a pointed bodkin of metal, bone or ivory, used for producing incised or engraved letters on boxwood tablets covered with wax. The calamus (Gr. κάλαμος) or arundo, the hollow tubular stalk of grasses growing in marshy lands, was the true ancient representative of the modern pen; hollow joints of bamboo were similarly employed. An early specific allusion to the quill pen occurs in the writings of St Isidore of Seville (early part of the 7th century), but there is no reason to assume that it was not in use at a still more remote date. The quills still largely employed among Western communities as writing instruments are obtained principally from the wings of the goose (see Feather). In 1809 Joseph Bramah devised and patented a machine for cutting up the quill into separate nibs by dividing the barrel into three or even four parts, and cutting these transversely into “two, three, four and some into five lengths.” Bramah’s invention first familiarized the public with the appearance and use of the nib slipped into a holder. In 1818 Charles Watt obtained a patent for gilding and preparing quills and pens, which may be regarded as the precursor of the gold pen. But a more distinct advance was effected in 1822, when J. H. Hawkins and S. Mordan patented the application of horn and tortoise-shell to the formation of pen-nibs, the points of which were rendered durable by small pieces of diamond, ruby or other very hard substance, or by lapping a small piece of thin sheet gold over the end of the tortoise-shell.

Metallic pens, though not unknown in classical times—a bronze pen found at Pompeii is in the Naples Museum—were little used until the 19th century and did not become common till near the middle of that century. It is recorded that a Birmingham split-ring manufacturer, Samuel Harrison, made a steel pen for Dr Joseph Priestley in 1786. Steel pens made and sold in London by a certain Wise in 1803 were in the form of a tube or barrel, the edges of which met to form the slit, while the sides were cut away as in the case of an ordinary quill. Their price was about five shillings each, and the hardness and satisfaction of the instrument in they were not in great demand. A metallic pen patented by 1 Instrumenta scribae calamus et pen ; ex his enim verba paginis infugitur; sed calamus arboreis est, penne avis, cujus acumen dividitur in duob.

Bryan Donkin in 1808 was made of two separate parts, flat or nearly so, with the flat sides placed opposite each other to form the slit, or alternatively of one piece, flat and not cylindrical as in the usual form, bent to the proper angle for insertion in the tube which constituted the holder. To John Mitchell probably belongs the credit of introducing machine-made pens, about 1822, and James Perry is believed to have been the first maker of steel slip pens. In 1828 Josiah Mason, who had been associated with Samuel Harrison, in the manufacture of split rings, saw Perry’s pens on sale in Birmingham, and after examining them saw his way both to improve and to cheapen the process of making them. He therefore put himself in communication with Perry, and the result was that he began to make barrel pens for him in 1828 and slip pens in 1829. Perry, who did much to popularize the steel pen and bring it into general use, in his patent of 1830 sought to obtain greater flexibility by forming a central hole between the points and the shoulders and by cutting one or more lateral slits on each side of the central slit; and Joseph Gillot, in 1831 described an improvement which consisted in forming elongated points on the nibs of the pens.

The metal used consists of rolled sheets of cast steel of the finest quality made from Swedish charcoal iron. These sheets, after being cut into strips of suitable width, annealed in a muffle-furnace and pickled in a bath of dilute sulphuric acid to free the surface from oxidized scale, are rolled between steel rollers till they are reduced to ribbons of an even thickness, about 4/10 in. From these ribbons the pen blanks are next punched out, and then, after being embossed with the name of the maker or other marks, are pierced with the central perforation and the side or auxiliary slits by which flexibility is obtained. After another annealing, the blanks, which up to this point are flat, are “mised” or rounded between dies into the familiar semicylindrical shape. The process is then to harden and temper them by heating them in iron boxes in a muffle-furnace, plunging them in oil, and then heating them over a fire in a rotating cylindrical vessel till their surfaces attain the dull blue tint characteristic of spring-steel elasticity. Subsequently they are “scoured” in a bath of dilute acid, and polished in a revolving cylinder. The grinding of the points with emery follows, and then the central slit is cut by the aid of two very fine-edged cutters. Finally the pens are again polished, are coloured by being heated over a fire in a revolving cylinder, and in some cases are coated with a varnish of shellac dissolved in alcohol. Birmingham was the first home of the steel pen industry, and continues its principal centre. This manufacture on a large scale was begun in the United States about 1860 at Camden, N. J., where the Eaterbrook Steel Pen Manufacturing Company was incorporated in 1866.

Metals other than steel have frequently been suggested by inventors, those most commonly proposed being gold, silver, zinc, German silver, aluminium and aluminium bronze. Dr W. H. Wollaston, it is recorded, had a gold pen composed of two thin strips of gold tipped with rhodium, apparently made on the principle patented by Donkin in 1808, and Lord Byron used one in 1810. Gold being extremely resistant to corrosion, pens made of it are very durable, but the metal is too soft for the points, which wear quickly unless protected by some harder material. For this purpose iridium is widely employed, by fusing the gold round it with a blowpipe.

Various devices have been adopted in order to increase the time for which a pen can be used without a fresh supply of ink. These fall into two main classes. In one, the form of the nib itself is modified, or some attachment is added, to enlarge the ink capacity; in the other, which is by far the more important, the holder of the pen is utilized as a cistern or reservoir from which ink is supplied to the nib. Pens of the second class, which have the further advantage of being portable, are heard of under the name of “fountain inkhorns” or “fountain pens” so far back as the beginning of the 18th century, but it was not till a hundred
years later that inventors applied themselves seriously to their construction. Joseph Bramah patented several plans; one was to employ a tube of silver or other metal so thin that it could be readily squeezed out of shape, the ink within it being thus forced out to the nib, and another was to fit the tube with a piston that could slide down the interior and thus eject ink. In modern fountain pens a feed bar conveys, by capillary action, a fresh supply of ink to replace that which has been left on the paper in the act of writing, means being also provided by which air can pass into the reservoir and fill the space left empty by the outflowing ink. In another form of reservoir pen, which is usually distinguished by the name stylograph, there is no nib, but the ink flows out through a minute hole at the end of the holder, which terminates in a conical point. An iridium needle, held in place by a fine spring, projects slightly through the hole and normally keeps the aperture closed; but when the pen is pressed on the paper, the needle is pushed back and allows the stream of ink to flow out.

See J. P. Maginies, "Reservoir, Stylographic and Fountain Pens," Cantor Lectures, Society of Arts (1905).

**PENALTY** (Lat. poena, punishment), in its original meaning, a punishment inflicted for some violation of the law or rule of conduct. Although still freely used in its original sense in such phrases, as "the death penalty," "the penalty of rashness," etc., the more usual meaning attached to the word is that of a pecuniary mulct. Penalty is used specifically for a sum of money recovered by virtue of a penal statute, or recoverable in a court of summary jurisdiction for infringement of a statute. A sum of money agreed upon to be paid in case of non-performance of a condition in a bond or in breach of a contract or any stipulation of it is also termed a penalty (see **DAMAGES**).

**PENANCE** (Old Fr. penance, fr. Lat. poenitentia, penitence), strictly, repentance of sins. Thus in the Douai version of the New Testament the Greek word μετανοεῖν is rendered "penance," where the Authorized Version has "repentance." The two words, similar in their derivation and original sense, have however come to be symbolic of conflicting views of the essence of repentance, arising out of the controversy as to the respective merits of "faith" and "good works." The Reformers, upholding the doctrine of justification by faith, held that repentance consisted in a change of the whole moral attitude of the mind and soul (ἐπαναστάσεως, Matt. xix. 15; Luke xxii. 32), and that the Divine forgiveness followed true repentance and confession to God without any reparation of "works." This is the view generally held by Protestants. In the Roman Catholic Church the sacrament of penance consists of three parts: contrito, confession, satisfaction. Contrito is in fact repentance as Protestant theologians understand it, i.e. sorrow for sin arising from love of God, and long before the Reformation the schoolmen debated the question whether complete "contrition" was or was not in itself sufficient to obtain the Divine pardon. The Council of Trent, however, decided that "reconciliation" could not follow such contrition without the other parts of the sacrament, which form part of it (sine sacramenti voto, quod in illa includatur). Contrition is also distinguished from "attrition" (attrito), i.e. repentance due to fear of punishment. It was questioned whether a state of mind thus produced would suffice for obtaining the benefits of the sacrament; this point was also set at rest by the Council of Trent, which decided that attrition, though not in itself capable of obtaining the justification of the sinner, is also inspired by God and thus disposes the soul to benefit by the grace of the sacrament.

The word "penance," applied to the whole sacrament, is also used of the works of satisfaction imposed by the priest on the penitent, i.e. the temporal punishment (poena). This varies with the character and heinousness of the offences committed. In the middle ages "doing penance" was often a process as terrible and humiliating to the penitent as it was possibly edifying to the Church. Public penances have, however, long been abolished in all branches of the Christian Church. (See **CONFESSION**.)

**PENANG** (Pulau Pinang, i.e. Areca-nut Island), the town and island which, after Singapore, form the most important portion of the crown colony of the Straits Settlements. The island is situated in 5° 24' N. and 100° 21' E., and distant about 23 m. from the Malayan Peninsula. The island is about 13½ m. long by 10½ m. wide at its broadest point. It is something over 100 sq. m. The town, which is built on a promontory at a point nearest to the mainland, is largely occupied by Chinese and Tamils, though the Malays are also well represented. Behind the town, Penang Hill rises to a height of some 2700 ft., and upon it are built several government and private bungalows. The town possesses a fine European club, a racecourse, and good golf links. Coco-nuts are grown in considerable quantities along the seashore, and rice is cultivated at Balek Pulau and in the interior, but the jungle still spreads over wide areas. Penang has an excellent harbour, but has suffered from its proximity to Singapore. There are a Church of England and a Roman Catholic church in the town, and a training college under the Roman Catholic missionaries of the Société des Missions Étrangères at Pulau Tikus, a few miles outside the town.

**Administration.**—Since 1867 Penang has been under the administrative control of a resident councillor who is responsible to the governor of the Straits. He is aided in his duties by officers of the Straits Civil Service. Two unofficial members of the legislative council of the colony, which holds its sittings in Singapore, are nominated by the governor, with the sanction of the secretary of state for the colonies, to represent Penang. Their term of office is for five years. The official name of the island is Prince of Wales Island and that of the town is George-town; neither of these names, however, is in general use. Among the Malays Penang is usually spoken of as Tangjong or "The Cape," on account of the promontory upon which the town is situated. The town is administered by a municipal council composed of ex officio, nominated, and elected members.

**Trade and Commerce.**—The population of Penang at the census of 1901 was 128,830, of whom 85,570 were males (60,210 over and 15,360 under 15 years of age), and 43,260 were females (28,725 over and 15,035 under 15 years of age). The population was composed of 71,462 Chinese, 34,286 Malays, 18,740 Tamils and other natives of India, 1,169 Eurasians, 99 Europeans and Americans, and 1,690 persons of other nationalities. As in other parts of the Straits Settlements the men are far more numerous than the women. The total population of the settlement of Penang, which includes not only the island but Province Wellesley and the Dindings, was 248,207 in 1901.

**Shipping.**—The number of ships which entered and left the port of Penang during 1906 was 2,231, with an aggregate tonnage of 2,968,459. Of these 1,802 were British with an aggregate tonnage of 1,966,886. These figures reveal a considerable falling-off during the past decade, the number of vessels entering and leaving the port in 1896 being 5,114 with an aggregate tonnage of 3,761,094. This is mainly due to the construction of the railway which runs from a point on the mainland opposite to Penang, through the Federated Malay States of Perak, Selangor and the Négeri Sembilan to Malacca, and has diverted to other ports and eventually to Singapore much of the coastal traffic from Penang to the Malay Peninsula.

**Finance and Trade.**—The revenue of Penang, that is to say, not only of the island but of the entire settlement, amounted in 1906 to $6,031,917, of which $2,014,053 was derived from the revenue from the collection of import duties on opium, wine and spirits; $160,047 from postal revenue; $119,385 from land revenue; $129,151 from stamps. The expenditure for 1906 amounted to $5,072,496, of which $8,656,97 of was spent on administrative establishments, $501,252 on the upkeep of existing public works; $417,175 on the construction of works and buildings, and of new roads, streets, bridges, &c. The imports in 1906 valued at $94,546,112, the exports at $90,709,225. Of the imports $7,880,995 worth came from the United Kingdom or from British possessions or protectorates; $23,937,737 worth came from foreign countries; and $3,966,241 from the Dindings, Malacca and Singapore. Of the exports, $23,122,947 went to the United Kingdom, or to British dependencies or protectorates; $23,122,947 went to the United Kingdom, or to British dependencies or protectorates; $2,745,238 went to the Dindings, Malacca or Singapore.

**History.**—Penang was founded on the 17th of July 1786, having been ceded to the East India Company by the Sultan of Kedah in 1783 by an agreement with Captain Light, for an annuity of $10,000 for eight years. In 1791 the subsidy was
changed to $6000, in perpetuity; for some years later this was raised to $10,000, and is still annually paid. This final addition was made when Province Wellesley was purchased by the East India Company for $2000 in 1798. At the time of the cession Penang was almost uninhabited. In 1796 it was made a penal settlement, and 700 convicts were transferred thither from the Andaman Islands. In 1805 Penang was made a separate presidency, ranking with Bombay and Madras; and when in 1826 Singapore and Malacca were incorporated with it, Penang continued to be the seat of government. In 1829 Penang was reduced from the rank of a presidency, and eight years later the town of Singapore was made the capital of the Settlements. In 1867 the Straits Settlements were created a Crown colony, in which Penang was included.

See Straits Settlements Blue Book 1906 (Singapore, 1907); The Straits Directory (Singapore, 1907); Sir Frank Swettenham, British Malaya (London, 1906).

**PENARTH—PENATES**

an urban district and seaport in the southern parliamentary division of Glamorganshire, Wales, 166 m. by rail from London, picturesquely situated on rising ground on the south side of the mouth of the Ely opposite Cardiff, from which it is 4 m. distant by rail and 2 m. by steamer. Pop. (1901), 14,228. The place derives its name from two Welsh words, “pen,” a head, and “garth,” an enclosure. Penarth was a small and unimportant village until a tidal harbour at the mouth of the Ely was opened in 1850, and a railway, 6 m. long, was made about the same time, connecting the harbour with the Taff Vale railway at Radyr. A dock, authorized in 1857, was opened in 1865, when all three undertakings, which had cost £75,000, were leased in perpetuity to the Taff Vale Railway Company. The monopoly which the Tey Dock at Cardiff had previously enjoyed in shipping coal from the valleys of the Taff and Rhondda was thus terminated. The town is frequented in summer as a bathing-place, and the Rhetic beds at the head are of special interest to geologists. On this head there stood an old church, probably Norman, which served as a landmark for sailors. The remains of an old chantry have been converted into a barn. Besides two Established and one Roman Catholic church, the principal buildings of Penarth are its various Nonconformist chapels, intermediate and technical school (1894), custom house, dock offices, and Turner House with a private art gallery which is thrown open on certain days to the public. Three miles to the west is Dinas Powis Castle. In 1880–1883 gardens were laid out along the cliff, in 1894 a promenade and landing-berth with a length of 330 ft. was constructed, and a subway open at all times for foot passengers was made under the river Ely. The dock, as first constructed, comprised 17½ acres, was extended in 1884 at a cost of £250,000, and now covers 23 acres with a basin of 3 acres. It is 2900 ft. in length, has a minimum depth of 26 ft., and is furnished with every modern appliance for the export of coal, of which from 20,000 to 30,000 tons can be stored in the sidings near by. The Penarth-Ely tidal harbour has a water area of 55 acres with a minimum depth of 20 ft., and a considerable import trade is carried on here mainly by coasting vessels; but as only one of its sides has wharves (about 3000 ft. long) scarcely more than 5% of the total shipping of the port is done here. It has commodious warehouses, also tanks to hold about 6000 tons of oil.

**PENATES** (from Lat. penates, eatables, food). Roman gods of the store-room and kitchen. The store-room over which they presided was, in old times, beside the atrium, the room which served as kitchen, parlour, and bedroom in one; but in later times the store-room, was in the back part of the house. It was sanctified by the presence of the Penates, and none but pure and chaste persons might enter it, just as with the Hindus the kitchen is sacred and inviolable. They had no individual names, but were always known under the general designation, Penates. Closely associated with the Penates were the Laris (q.v.) another species of domestic deity, who seem to have been the defied spirits of deceased ancestors. But while each family had two Penates it had but one Lar. In the household shrine the image of the Lar (dressed in a toga) was placed between the two images of the Penates, which were represented as dancing and elevating a drinking-horn in token of joy and plenty. The three images together were sometimes called Penates, sometimes Laris, and either name was used metaphorically for "home." The shrine stood originally in the atrium, but when the hearth and the kitchen were separated from the atrium and removed to the back of the house, and meals were taken in an upper storey, the position of the shrine was also shifted. In the houses at Pompeii it is sometimes in the kitchen, sometimes in the rooms. In the later empire it was placed behind the house-door, and a taper or lamp was kept burning before it. But the worship in the interior of the house was also kept up even into Christian times; it was forbidden by an ordinance of Theodosius (A.D. 392). The old Roman used, in company with his children and slaves, to offer a morning sacrifice and prayer to his household gods. Before meals the blessing of the gods was asked, and after the meal, but before dessert, there was a short silence, and a portion of food was placed on the hearth and burned. If the hearth and the images were not in the eating-room, either the images were brought and put on the table, or before the shrine was placed a table on which were set a salt-cellar, food and a burning lamp. Three days in the month, viz. the Calends, Nones and Ides (i.e. the first, the fifth or seventh, and the thirteenth or fifteenth), were set apart for special family worship, as were also the Caristia (Feb. 22) and the Saturnalia in December. On these days as well as on such occasions as birthdays, marriages, and safe returns from journeys, the images were crowned and offerings made to them of cakes, honey, wine, incense, and sometimes a pig. As each family had its own Penates, so the state, as a collection of families, had its public Penates. Intermediate between the worship of the public and private Penates were probably the rites (sacra) observed by each clan (genus) or collection of families supposed to be descended from a common ancestor. The other towns of Latium had their public Penates as well as Rome. The sanctuary of the whole Latin league was at Lavinium. To these Penates at Lavinium the Roman priests brought yearly offerings, and the Roman consuls, praetors and dictators sacrificed both when they entered on and when they laid down their office. To them, too, the generals sacrificed before departing for their province. Alba Longa, the real mother-city of Latium, had also its ancient Penates, and the Romans maintained the worship on the Alban mount long after the destruction of Alba Longa. The Penates had a temple of their own, consecrated to Jupiter Penates, which was at Rome, and which has by some been identified with the round vestibule of the church of SS. Cosma e Damiano. In this and many other temples the Penates were represented by two images of youths seated holding spears. The Penates were also worshipped in the neighbouring temple at Vesta. To distinguish the two worship it has been supposed that the Penates in the former temple were those of Latium, while those in the temple of Vesta were the Penates proper of Rome. Certainly the worship of the Penates, whose altar was the hearth and to whom the kitchen was sacred, was closely connected with that of Vesta, goddess of the domestic hearth.

The origin and nature of the Penates was a subject of much discussion to the Romans themselves. They were traced to the mysterious worship of Samothrace; Darlanus, it was said, took the Penates from Samothrace to Troy, and after the destruction of Troy, Aeneas brought them to Italy and established them at Lavinium. From Lavinium Ascanius carried the worship to Alba Longa, and from Alba Longa it was brought to Rome. Equally unsatisfactory with this attempt to connect Roman religion with Greek legend are the vague and mystic speculations in which the later Romans indulged respecting the nature of the Penates. Some said they were the great gods to whom we owe breath, body and reason, viz. Jupiter representing the middle ether, Juno the lowest air and the earth, and Minerva the highest ether, to whom some added Mercury as the god of speech (Servius, on Aen. ii. 296; Macrobius, Sat. iii. 4, 8; Arnobius, Adv. Nat. iii. 40). Others identified them with Apollo
and Neptune (Macrobi. iii. 4, 6; Arnob. loc. cit.; Servius, on Aen. iii. 119). The Etruscans held the Penates to be Ceres, Pales and Fortuna, to whom others added Genius Jovialis (Servius, on Aen. ii. 372, Arnob. loc. cit.). The late writer Martianus Capella records the view that heaven was divided into sixteen regions, in the first of which were placed the Penates, along with Jupiter, the Lares, &c. More fruitful than these misty speculations is the suggestion, made by the ancients themselves, that the worship of these family gods sprang from the ancient Roman custom (common to many savage tribes) of burying the dead in the house. But this would account for the worship of the Lores rather than of the Penates. A comparison with other primitive religious beliefs suggests the conjecture that the Penates may be a remnant of fetisism or animism. The Roman genii seem certainly to have been fetics and the Penates were perhaps originally a species of genii. Thus the Penates, as simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo and Minerva.

With the Penates we may compare the kindly household gods of old Germany; they too had their home on the kitchen hearth and received offerings of food and clothing. In the castle of Hudemühlen (Hanover) there was a kobold for whom a cover was always set on the table. In Lapland each house had or may have had its kobold, one who is depicted as house-spirits by the Russians; they are represented as dwarfs, and are served with food and drink. Each house in Servia has its patron-saint. In the mountains of Mysore every house has its bhuta or guardian deity, to whom prayer and sacrifices are offered. The Chinese god of the kitchen presents some curious analogies to the Penates: incense and candles are burnt before him on the first and fifteenth of the month; some families burn incense and candles before him daily; and on great festivals, one of which is at the winter solstice (nearly corresponding to the Saturnalia), he is served with cakes, pork, wine, incense, &c., which are placed on a table before him.

See Roman Religion.

PENICIL (Lat. penicillus, brush, literally little tail), a name originally applied to a small fine-pointed brush used in painting, and still employed to denote the finer camel's-hair and sable brushes used by artists, but now commonly signifying solid cones or rods of various materials used for writing and drawing. It has been asserted that a manuscript of Theophrastus, attributed to the 1st century, shows signs of having been ruled with black-lead or black-lead pencil; but the first distinct allusion to its use occurs in the treatise on fossils by Conrad Gesner of Zurich (1563), who describes an article for writing formed of wood and a piece of lead, or, as he believed, an artificial composition called by some stimmi anglicanum (English antimony). The famous Borrowdale mine in Cumberland having been discovered about that time, it is probable that we have here the first allusion to that great find of graphite. While the supply of the Cumberland mine lasted, the material for English pencils consisted simply of the native graphite as taken from the mine. The pieces were sawn into thin sheets, which again were cut into the slender square rods forming the "lead" of the pencil.

Strenuous efforts were made on the continent of Europe and in England to enable manufacturers to become independent of the product of the Cumberland mine. In Nuremberg, where the great pencil factory of the Faber family (q.v.) was established in 1760, pencils were made from pulverized graphite cemented into solid blocks by means of gums, resins, glue, sulphur and other such substances, but none of these preparations have been used for many years. In 1831, the year of the death of Abbé Conté of Paris, devised the process by which now all black-lead pencils, and indeed pencils of all sorts, are manufactured. In 1843 William Brockedon patented a process for compressing pure black-lead powder into solid compact blocks by which he was enabled to use the dust, fragments, and cuttings of fine Cumberland lead. Brockedon's process would have proved successful but the exhaustion of the Borrowdale supplies and the excellence of Conté's process rendered it more of scientific interest than of commercial value.

The pencil leads prepared by the Conté process consist of a mixture of graphite and clay. The graphite, having been pulverized and subjected to any necessary purifying processes, is "floated" through a series of settling tanks, in each of which the comparatively heavy particles sink, and only the still finer particles are carried over. That which sinks in the last of the series is in a condition of extremely fine division, and is used for pencils of the highest quality. The clay, which must be free from sand and iron, is treated in the same manner. Clay and graphite so prepared are mixed together in varying proportions with water to a paste, passed repeatedly through a grinding mill, then placed in bags and squeezed in a hydraulic press till they have the consistency of stiff dough, in which condition they are ready for forming pencil rods. For this purpose the plastic mass is placed in a strong upright cylinder, from which a plunger or piston, moved by a screw, forces it out through a perforated base-plate in a continuous thread. This thread is finally divided into suitable lengths, which are heated in a closed crucible for some hours. The two factors which determine the comparative hardness and blackness of pencils are the proportions of graphite and clay in the leads and the heat to which they are raised in the crucible. According to such proportions of graphite and clay, and the heat lower the pencil is softer and of deeper black streak.

The wood in which the leads are cased is pencil cedar from Juniperus virginiana for the best qualities, and pine for the cheaper ones. A board of the selected wood, having a thickness about equal to half the diameter of the finished pencil and as wide as four or six pencils, is passed through a machine which smooths the surface and cuts round or square grooves to receive the leads. The leads being placed in the grooves the board is covered with another similarly grooved board, and the two are fastened together with glue. When dry they are taken to rapidly revolving cutters which remove the wood between the leads. The individual pencils thus formed only need to be finished by being dyed and varnished and stamped with name, grade, &c. Instead of wood, paper has been tried for the casings, rolled on in narrow strips which are torn off to expose fresh lead as the point becomes worn down by use.

Black pencils of an inferior quality are made from the dust of graphite melted up with sulphur and run into moulds. Such, with a little talc added, are sold in this country under the name of "artists'" pencils. They are used by carpenters. Coloured pencils consist of a mixture of clay and dubious material colouring matter, wax, and tallow, treated by the Conté method, as in making lead pencils. In indelible and copper pencils the colouring matter is aniline preparation mixed with clay and gum. The mixture not only makes a streak which adheres to the paper, but, when the writing is moistened with water, it dissolves and assumes the appearance and properties of an ink.

PENDA, king of Mercia (d. 634 or 655), son of Pybb, probably came to the throne in 626, but it is doubtful whether he actually became king of Mercia until 633, the year of the defeat and death of Edwin of Northumbria. According to the Anglo-Saxon Chronicle he was eighty years old at his death, but the energy of his administration and the evidence with regard to the ages of his children and relatives render it almost impossible. In 628 the Chronicle records a battle between him and the West Saxons at Cirencester in that year. In 633 Penda and Ceawlin overthrew Edwin at Hatfield Chase; but after the defeat of the Welsh king at Oswald at "Hefenfeldh" in 634, Mercia seems to have been for a time subject to Northumbria. In 642 Penda slew Oswald at a place called Maurfield. He was attacked by a force under the command of the West Saxons in reducing Bamborough. He drove Cenwalh of Wessex, who had divorced his sister, from his throne. In 644 he attacked the East Angles, and slew their king Anna (see EAST ANGLIA). In 654 or 655 he invaded Northumbria in spite of the attempts of Oswiu to buy him off, and was defeated and slain on the banks of the "Winwaed." In the reign of Penda the districts corresponding to Cheshire, Shropshire and Herefordshire were probably acquired, and he established his son Peada as a dependent prince in Middle Anglia. Although a pagan, he allowed his daughter Cyneburg to marry Alchfrith, the son of
Pendant—Pendleton, E.

PENDONTE, the term given in architecture to the bridging across the angles of a square hall, so as to obtain a circular base for a dome or drain. This may be done by corbeling out in the angles, in which case the pendentive may be a portion of a hemisphere of which the half diagonal of the square hall is the radius; or by throwing a series of arches across the angle, each ring as it rises advancing in front of the one below and being carried by it during its construction; in this case the base obtained is octagonal, so that corbels or small pendentives are required for each angle of the octagon, unless as in the church of SS. Sergius and Bacchus at Constantinople a portion of the dome is set back; or again, by a third method, by sinking a semicircular niche in the angle. The first system was that employed in St Sophia at Constantinople, and in Byzantine churches generally, also in the domed churches of Perigord and Aquitaine. The second is found in the Sassanian palaces of Serbistan and Firuzabad, and in medieval architecture in England, France and Germany, where the arches are termed “squinces.” The third system is found in the mosque at Damascus, and was often adopted in the churches in Asia Minor. There is still another method in which the pendentive and cupola are part of the same hemispherical dome, and in this case the ring courses lie in vertical instead of horizontal planes, examples of which may be found in the vault of Magnesia on Maeander in Asia Minor, and in the tomb at Valence known as le pendentif de Valence. The problem is one which has taxed the ingenuity of many builders in ancient times; the bas-reliefs found at Nimrud show that in the 9th century B.C. domes were evidently built over square halls, and must have been carried on pendentives of some kind.

Pender, Sir John (1816-1896). British cable pioneer, was born in the Vale of Leven, Scotland, on the 10th of September 1816, and after attending school in Glasgow became a successful merchant in textile fabrics in that city and in Manchester. His name is chiefly known in connexion with submarine cables, of which on the commercial side he was an important promoter. He was one of the 345 contributors who each risked a thousand pounds in the Transatlantic Cable in 1857, and when the Atlantic Telegraph Company was ruined by the loss of the 1865 cable he formed the Anglo-American Telegraph Company to continue the work, but it was not till he had given his personal guarantee for a quarter of a million pounds that the makers would undertake the manufacture of a new cable. But in the end he was justified, and telegraphic communication with America became a commercial success. Subsequently he fostered cable enterprise in all parts of the world, and at the time of his death, which occurred at Footscray Place, Kent, on the 7th of July 1896, he controlled companies having a capital of 15 millions sterling and owning 73,650 miles of cables. He represented Wick Burghs in parliament from 1872 to 1885 and from 1892 to 1896. He was made a K.C.M.G. in 1888 and was promoted in 1892 to be G.C.M.G. His eldest son James (b. 1841), who was M.P. for Mid Northamptonshire in 1895-1900, was created a baronet in 1897; and his third son, John Denison (b. 1855), was created a K.C.M.G. in 1901.

Pendleton, Edmund (1721-1803), American lawyer and statesman, was born, of English Royalist descent, in Caroline county, Virginia, on the 9th of September 1721. He was self-educated, but after reading law and being admitted to the bar (1744) his success was immediate. He served in the Virginia House of Burgesses from 1752 until the organization of the state government in 1776, was the recognized leader of the conservative Whigs, and took a leading part in opposing the British government. He was a member of the Virginia committee of correspondence in 1773, in 1774 was president of the Virginia provincial convention, and a member of the first
Continental Congress. In 1776, as president of the provincial convention, which adopted a state constitution for Virginia, he drew up the instructions to the Virginia members of Congress directing them to advocate the independence of the American colonies. In the same year he became president of the Virginia committee of safety, and in October was chosen the first speaker of the House of Delegates. With Jefferson and Chancellor George Wythe he drew up a new law code for Virginia. He was president of the court of chancery in 1777–1778, and from 1779 until his death was president of the Virginia court of appeals. He was an enthusiastic advocate of the Federal constitution, and in 1788 exerted strong influence to secure its ratification by his native state. He was a leader of the Federalist party in Virginia until his death at Richmond, Va., on the 23rd of October 1803.

Pendleton, George Hunt (1825–1889), American lawyer and legislator, was born in Cincinnati, Ohio, on the 25th of July 1825. He was educated at the university of Heidelberg, studied law, was admitted to the bar, and began to practise at Cincinnati. He was a member of the Ohio Senate in 1854 and 1855, and from 1857 to 1865 was a Democratic member of the national House of Representatives, in which he opposed the war policy of Lincoln. In 1864 he was the Democratic candidate for vice-president. After leaving Congress he became one of the earliest champions of the "Ohio idea" (which he is said to have originated), demanding that the government should pay the principal of its 5–20-year 6% bonds in the "great panic" of 1857. He emphasized the agricultural classes of the West regarded this as a means of relief, and Pendleton became their recognized leader and a candidate for the Democratic nomination to the presidency in 1868, but he failed to receive the requisite two-thirds majority. In 1869 he was the Democratic candidate for governor of Ohio, but was defeated by Rutherford B. Hayes. For the next ten years he devoted himself to the practice of law and to the supervision of the Kentucky Railroad Company, of which he had become president in 1869. From 1879 to 1885 he was a Democratic member of the United States Senate, and introduced the so-called Pendleton Act of 1883 for reforming the civil service, hostility to which lost him his seat in 1885. He was minister to Germany from 1885 to the summer of 1889, and died at Brussels on the 24th of November 1889.

Penelope, in Greek legend, wife of Odysseus, daughter of Icarius and the nymph Periboea. During the long absence of her husband after the fall of Troy many chieftains of Ithaca and the islands round about became her suitors; and, to rid herself of the importunities of the wooers, she bade them wait till she had woven a winding-sheet for old Laertes, the father of Odysseus. But every night she undid the work which she had woven by day. This she did for three years, till her maids revealed the secret. She was relieved by the arrival of Odysseus, who returned after an absence of twenty years, and slew the wooers. The character of Penelope is less favourable in later writers than in the Homeric story. During her husband's absence she is said to have become the mother of Pan by Hermes, and Odysseus, on his return, repudiated her as unfaithful (Herodotus ii. 145 and scho!.). She thereupon withdrew to Sparta and thence to Mantinea, where she died and where her tomb was shown. According to another account she married Telegonus, the son of Odysseus and Circe, after he had killed his father, and dwelt with him in the island of Aeolia or in the Islands of the Blest (Hyginus, Feb. 127).

Pengelly, William (1812–1894). English geologist and anthropologist, was born at East Looe in Cornwall on the 12th of January 1812, the son of the captain of a small coasting vessel. He began life as a sailor, after an elementary education in his native village, but in 1828 he abandoned a seafaring life. He had developed a passion for learning, and about 1836 he removed to Torquay and started a school; in 1840 he became a private tutor in mathematics and natural science. Geology had in early years attracted his attention, but it was not until he was about 30 years of age that he began seriously to cultivate the study. In 1837 he was instrumental in the reorganization of the Torquay Mechanics' Institute, in 1844 mainly owing to his efforts, and in 1853, of which he was the first president, and in 1862 he assisted in founding the Devonshire Association for the Advancement of Literature, Science and Art. Meanwhile he had been occupied in collecting fossils from many parts of Devon and Cornwall, and in 1860 the Baroness Burdett-Coutts acquired and presented them to the Oxford Museum, where they form "The Pengelly Collection." Through the generosity of the same lady he was called upon to examine the lignites and clays of Bovey Tracey, in conjunction with Dr Oswald Heer, who undertook the determination of the plant-remains. Their report was published by the Royal Society (1862), and Pengelly was elected F.R.S. in 1863. He aided in the investigations of the Brixham bone-cavern from the date of its discovery in 1858, the full report being issued in 1873; and he was the main explorer of Kent's Hole, Torquay, and from 1864 for more than fifteen years he laboured with unflagging energy in examining and recording the exact position of the numerous organic remains that were disinterred during a systematic investigation of this cave, carried on with the aid of grants from the British Association. He first attended the British Association at the Cheltenham meeting in 1836, and was present at subsequent meetings (except that of 1857) in 1838, until 1850. His chief work was in establishing the important fact of the contemporaneity of Palaeolithic man with various Pleistocene mammals, such as the mammoth, cave-bear, cave-lion, &c. He was awarded the Lyell medal by the Geological Society of London in 1886. He died at Torquay on the 16th of March 1894.

See Memoir of William Pengelly, edited by his daughter Hester Pengelly, with a summary of his scientific work by the Rev. Prof. T. G. Bonney (1897).

Penguin, the name of a flightless sea-bird, but, so far as is known, first given to one inhabiting the seas of Newfound-land as in Hore's "Voyage to Cape Breton," 1536 (Hakluyt, Researches, iii. 168–170), which subsequently became known as the great auk or garefol (g.a.); though the French equivalent Pingouin² preserves its old application, the word penguin is by English ornithologists always used for certain birds inhabiting the Southern Ocean, called by the French Manchots, the Spatule-footed or Long-footed penguins. Of or from this position was very much misunderstood, some systematists having placed them with the Alcidae or Auks, to which they bear only a relationship of analogy, as indeed had been perceived by a few ornithologists, who recognized in the penguins a very distinct order, Impennes. L. Stejneger (Standard Nat. Hist. vol. iv., Boston, 1887) gave the Impennes independent rank equivalent to the rest of Carinate birds; M. A. Menzbie (Vergl. Osteol. d. Penguin, Moscow, 1887) took a similar view; M. Führinger was first to show their relation to Procellariformes, and this view is now generally accepted.

¹ Of the three derivations assigned to this name, the first is by Drayton in 1613 (Polyolbion, Song 9), where it is said to be the Welsh pen gwyn, or white head; the second, which seems to meet with the approval of the courts used by the (fat), which idea has given origin to the German name, Fettgänse, for these birds; the third supposes it to be a corruption of "pin-wing" (Ann. Nat. History, 4th series, vol. iv. p. 133), meaning a bird that has under-gone a change; the French Manchots or, as in one part at least of England it is commonly called, "pin-winging." The first hypothesis has been supported on the ground that Breton sailors speaking a language closely allied to Welsh were acquainted with the great auk, and that the conspicuous white patches on the head of that bird were regarded in the same light. The second hypothesis is Skeat (Dictionary, p. 433) objects that it "will not account for the suffix -in, and is therefore wrong; besides which the 'Dutchmen' [who were asserted to be the authors of the name] turn out to be Sir Francis Drakes own men and his main supporter, the third hypothesis Mr Reeks wrote (Zoologist, 2nd series, p. 1854) that the people in Newfoundland who used to meet with this bird always pronounced its name "pin-wings" Skeat's inquiry (loc. cit.), whether the name may not after all be South American, is to be answered in the negative, since, so far as evidence goes, it was given to the North-American bird before the South-American was known in Europe.

² Gorfou has also been used by some French writers, being a corruption of Geirfugl or Garefowl.
There is a total want of quills in their wings, which are incapable of flexure, though they move freely at the shoulder-joint, and some at least of the species occasionally make use of them for progressing on land. In the water they are most efficient paddles. The plumage, which clothes the whole body, generally consists of small scale-like feathers, many of them consisting only of a simple shaft without the development of barbs; but several of the species have the head decorated with long cirrhous tufts, and in some the tail-quills, which are very numerous, are also long.1 In standing these birds preserve an upright position, sometimes resting on the "tarsus"2 alone, but in walking or running this is kept nearly vertical, and their weight is supported by the toes alone.

The most northerly limit of the penguins' range in the Atlantic is Tristan d'Acuna, and in the Indian Ocean Amsterdam Island, but they also occur off the Cape of Good Hope and along the coast of Australia, as well as on the south and east of New Zealand, while in the Pacific one species at least extends along the west coast of South America and to the Galapagos; but north of the equator none are found. In the breeding season they resort to the most desolate lands in higher southern latitudes, and indeed have been met with as far to the southward as navigators have penetrated. Possibly the Falkland Islands are richest in species, though, as individuals, they three can be well distinguished, as pointed out by E. Coues in Proc. Acad. Nat. Sci. of Philadelphia, 1872 (pp. 170-212), by anatomical as well as by external characters. They are: (1) Aptenodytes, easily recognized by its long and thin bill, slightly decurved, from which Pygoscelis, as M. Watton has shown, is hardly distinguishable; (2) Eudyptes, in which the bill is much shorter and rather broad; and (3) Spheniscus, in which the shortish bill is compressed and the maxilla ends in a conspicuous hook. Aptenodytes contains the largest species, among them those known as the "Emperor" and "King" penguins A. patagonica and A. longirostris. Three others belong also to this genus, if Pygoscelis be not recognized, but they seem not to require any particular remark. Eudyptes, containing the crested penguins, known to sailors as "Rock-hoppers" or "Macaronis," would appear to have five species, and Spheniscus four, among which S. mendiculus, which occurs in the Galapagos, and therefore has the most northerly range of the whole group, alone needs notice here. (A. N.)

The generic and specific distribution of the penguins is the subject of an excellent essay by Alphonse Milne-Edwards in the Annales des sciences naturelles for 1880 (vol. ix. art. 9, pp. 23-81); see also the Records of the Antarctic Expedition, 1901-1904.

PENHALLOW, SAMUEL (1665-1726), American colonist and historian, was born at St. Malon, Corn., England, on the 2nd of July 1665. From 1683 to 1686 he attended a school at Newington Green (near London) conducted by the Rev. Charles Morton (1627-1668), a dissenting clergyman, with whom he emigrated to Massachusetts in 1686. He was commissioned by the Society for the Propagation of the Gospel in New England to study the Indian languages and to preach to the Indians; but he was soon divorced from this work. Removing to Portsmouth, New Hampshire, he there married a daughter of John Cutt (1623-1681), president of the province of New Hampshire in 1670-1680, a successful merchant and mill-owner, and thus came into possession of considerable property (including much of the present site of Portsmouth). In 1706 he was speaker of the Assembly and in 1707 became a member of the Provincial Council, but was suspended by Lieut. Governor George Vaughan (1676-1724). Penhallow, however, was sustained by Governor Samuel Shute (1662-1742), and Vaughan was removed from office in 1716. In 1714 Penhallow was appointed a justice of the superior court of judicature, and from 1717 until his death was chief justice of that court; and he also served as treasurer of the province in 1690-1726, and as secretary of the province in 1714-1726. He died at Portsmouth on the 2nd of December 1726. He wrote a valuable History of the War of New England with the Eastern Indians, or a Narrative of their Continued Perfidy and Cruelty (1726; reprinted in the Collections of the New Hampshire Historical Society, vol. i., 1824, and again at Cincinnati in 1859), which covers the period from 1703 to 1726, and is a standard contemporary authority.

PENINGTON, SIR ISAAC (c. 1587-1669), lord mayor of London, eldest son of Robert Penington, a London fishmonger, was born probably before 1587. His father besides his London business had landed estates in Norfolk and Suffolk, which Isaac inherited in addition to a property in Buckinghamshire which he himself purchased. In 1638 Isaac became an alderman and high sheriff of London. In 1640 he was elected to the House of Commons as member for the city of London, and immediately took a prominent place among the Puritan party. In 1642 he was elected lord mayor of London, but retained his seat in parliament by special leave of the Commons; and he was elected lord mayor for a second term in the following year, continuing while in office to raise large sums of money for the opposition to the Court party. From 1642 to 1645 he was lieutenant of the Tower, in which capacity he was present at the execution of Laud; but, though one of the commissioners for the trial of Charles I., he did not sign the death warrant. After the king's death Penington served on Cromwell's council of state, and on several committees of government. His services were rewarded by considerable grants of land, and a

King-Penguin (Aptenodytes pennantii).
knighthood conferred in 1649. He was tried and convicted of treason at the Restoration, and died while a prisoner in the Tower on the 17th of December 1661. He was twice married, and had six children by his first wife, several of whom became Quakers.

ISAAC PENINGTON (1616–1679), Sir Isaac’s eldest son, was one of the most notable of the 17th-century Quakers. He was early troubled by religious perplexities, which found expression in many voluminous writings. No less than eleven religious works, besides a political treatise in defence of democratic principles, were published by him in eight years. He belonged for a time to the sect of the Independents; but about 1657, influenced probably by the preaching of George Fox, whom he heard in Bedfordshire, Penington and his wife joined the Society of Friends. His wife was daughter and heiress of Sir John Proude, and widow of Sir William Springett, so that the worldly position of the couple made them a valuable acquisition to the Quakers. Isaac Penington was himself a man of very considerable gifts and sweetness of character. In 1661 he was imprisoned for refusing to take the oath of allegiance, and on several subsequent occasions he passed long periods in Reading and Aylesbury gaols. He died on the 8th of October 1679; his wife, who wrote an account of his imprisonments, survived till 1682. In 1681 Penington’s works were published in a collected edition, and several later editions were issued before the end of the 18th century. His son John Penington (1655–1710) defended his father’s memory against attack, and published some controversial tracts against George Keith. Edward Penington (1667–1711), another of Isaac Penington’s sons, emigrated to Pennsylvania, where he founded a family. Isaac Penington’s stepdaughter, Gulielma Springett, married William Penn.

PENINSULA (Lat. paeninsula, from paene, almost, and insula, an island), in physical geography, a piece of land nearly surrounded by water. In its original sense it connotes attachment to a larger land-mass by a neck of land (isthmus) narrower than the peninsula itself, but it is often extended to apply to any long promontory that projects from the coast-line of which is markedly longer than the landward boundary.

PENINSULAR WAR (1808–14). This important war, the conduct and result of which greatly enhanced the prestige of British arms, had for its main object the freedom of the Peninsula of Spain and Portugal from the domination of Napoleon; and hence it derives its name, though it terminated upon the soil of France.

Nelson having destroyed the French fleet at Trafalgar, Napoleon feared the possibility of a British army being landed on the Peninsular coasts, whence in conjunction with Portuguese and Spanish forces it might attack France from the south. He therefore called upon Portugal, in August 1807, to comply with his Berlin decree of the 21st of November 1806, under which continental nations were to close their ports to British subjects, and have no communication with Great Britain. At the same time he persuaded the weak king of Spain (Charles IV.) and his corrupt minister Godoy to permit a French army to pass through Spain towards Portugal; while under a secret treaty signed at Fontainebleau on the 27th of October 1807 Spanish soldiers were to support the French. Portugal was to be subsequently divided between Spain and France, and a new principality of the Algarve was to be carved out for Godoy. Portugal remonstrated against Napoleon’s demands, and a French corps (30,000) under General Junot was instantly despatched to Lisbon. Upon its approach the prince regent fled, and the country was occupied by Junot, most of the Portuguese troops being disbanded or sent abroad. Napoleon induced the king of Spain to allow French troops to occupy the country and to send the flower of the Spanish forces (15,000) under the marquis of Romana1 to assist the French on the Baltic. Then Dupont de l’Etang (25,000) was ordered to cross the Bidassoa on the 22nd of November 1807; and by the 8th of January 1808 he had reached Burgos and Valladolid. Marshal Monecy with a corps occupied Biscay and Navarre; Duhesme with a division entered Catalonia; and a little later Bessières with another corps had been brought up. There were now about 100,000 French soldiers in Spain, and Murat, grand duke of Berg, as “lieutenant for the emperor,” entered Madrid. During February and March 1808 the frontier fortresses of Pampluna, St Sebastian, Barcelona and Figueras were treacherously occupied and Spain lay at the feet of Napoleon. The Spanish people, in an outburst of fury against the king and Godoy, forced the former to abdicate in favour of his son Ferdinand; but the inhabitants of Madrid having (May 2, 1808) risen against the French, Napoleon refused to recognize Ferdinand; both he and the king were compelled to renounce their rights to the throne, and a mercenary council of regency having been induced to desire the French emperor to make his brother, Joseph Bonaparte, king, he acceded to their request.2

The mask was now completely thrown off, and Spain and Portugal rose against the French. Provincial “juntas” (com- mittees) began to form themselves; and severe resistance was made to the British government, which granted arms, money and supplies, and it was resolved to despatch a British force to the Peninsula. Before it landed, the French under Dupont, Monecy and Marshal Bessières (75,000) had occupied parts of Biscay, Navarre, Aragon and the Castiles, holding Madrid and Toledo, while General Duhesme (14,000) was in Catalonia. Monecy (7000) had marched towards the city of Valencia, but been repulsed in attempting to storm it (June 28); Bessières had defeated the Spanish general Joachim Blake at Medina de Rio Seco (June 14, 1808) and Dupont (13,000) had been detached (May 24) from Madrid to reduce Seville and Cadiz in Andalusia. Spanish levies, numbering nearly 100,000, were in arms, and militia, brave and enthusiastic, but without organization, sufficient training, or a commander-in-chief, had collected together; 30,000 being in Andalusia, a similar number in Galicia, and others in Valencia and Estremadura, but few in the central portion of Spain.

At this juncture Dupont, moving upon Cadiz, met with a reverse which greatly influenced the course of the Peninsular War. On the 30th of June 1808 he had sacked Cordova; but while he was laden with its spoils the Spanish general Castaños with the army of Andalusia (50,000), and a large body of armed peasantry, approached. Falling back to Andujar, where he was reinforced to 22,000 strong, Dupont detached a force to hold the mountain passes in his rear, whereupon the Spaniards interposed between the detachment and the main body and seized Baylen. Failing to disable them, and surrounded by hostile troops and an infuriated peasantry, Dupont capitulated with over 25,000 men. This victory, together with the intrepidity of Saragossa by the Spanish general José Palafox (June 15 to August 13, 1808) temporarily paralysed the French and created unbounded enthusiasm in Spain. Duhesme, having failed to take Gerona, was blockaded in Barcelona, Joseph fled from Madrid (Aug. 1, 1808), and the French forces closed to their rear to defend their communications with France. The British troops were directed towards Lisbon and Cadiz, in order to secure these harbours, to prevent the subjugation of Andalusia, and to operate up the basins of the Guadiana, Tagus, and Duero to Spain. The British force of about 20,000 men from Cork, under Sir Arthur Wellesley—at first in chief command; 8000 from Gibraltar, under General (Sir Brent) Spencer; and 10,000 under Sir John Moore coming from Swelen: Wellesley and Moore being directed towards Portugal, and Spencer to Cadiz. On the 1st of August 1808

1 They subsequently escaped from Jutland, on British vessels, and reached Santander in October 1808.

2 The king, the queen and Godoy were eventually removed to Rome, and Ferdinand to Valencey in France.
Wellesley began to land his troops, unopposed, near Figueria da Foz, on the mouth of the Mondego; and the Spanish victory of Baylen having relieved Cadiz from danger, Spencer now joined him, and, without waiting for Moore the army, under 15,000 in all (which included some Portuguese)1 with 18 guns, advanced towards Lisbon.

**Campaign in Portugal, 1808.**—The first skirmish took place at Obidos on the 15th of August 1808, against Delaborde's division (5000 men with 5 guns), which fell back to Roleia (Rorica or Rolica). A battle took place here (Aug. 17) in which Sir Arthur Wellesley attacked and drove him from two successive positions. The allied loss was about 500: the French 600 and three guns.1 On the 20th of August the Allies, strengthened by the arrival of two more brigades (4000 men), occupied some heights north of Vimeira (Vimeira or Vimeiro) where the roads branch off to Torres Vedras and Mafra. Wellesley meant to turn the defile of Torres Vedras by Mafra at once if possible; but on this night, Sir Harry Burrard, his senior, arrived off Vimeira, and though he did not land, gave instructions to wait for Sir John Moore. On the 21st of August the Allies were attacked by Junot at Vimeira, who, leaving a force at Lisbon, had come up to reinforce Delaborde. In this battle the Allies numbered about 18,000 with 18 guns, French nearly 14,000, with 20 guns. Junot, believing the allied left to be weakly held, attacked it without reconnoitring, but Wellesley's regiments, marched thither behind the heights, sprang up in line; and under their volleys and bayonet charge, supported by artillery fire, Junot's deep columns were driven off the direct road to Lisbon. The losses were: Allies about 800, French 2000 and 13 guns. It was now again Wellesley's wish to advance and seize Torres Vedras; but Sir Hew Dalrymple, having at this moment assumed command, decided otherwise. On the 2nd of August Junot, knowing of the approach of Moore with reinforcements, and afraid of a retreat of Lisbon, opened negotiations, which resulted in the Convention of Cintra2 (Aug. 30, 1808), under which the French evacuated Portugal, on condition that they were sent with their artillery and arms to France. Thus this campaign had been rapidly brought to a satisfactory conclusion; and Sir Arthur Wellesley had already given proof of his exceptional gifts as a leader. In England however a cry was raised that Junot should have been forced to an absolutely unconditional surrender; and Sir Arthur Wellesley, Sir Hew Dalrymple and Sir Harry Burrard3 were brought before a court of inquiry in London. This acquitted them of blame, and Sir John Moore in the meantime after the departure of Dalrymple (Oct. 6, 1808) had assumed command of the allied army in Portugal, now amounting to 32,000 strong.

**Moore's Campaign in Spain, 1808-9.**—The British government notified to Sir John Moore that some 10,000 men were to be sent to Corunna under Sir David Baird; that he, with 20,000, was to join him, and then both act in concert with the Spanish armies. As the conduct of this campaign was largely influenced by the operations of the Spanish forces, it is necessary to mention their positions, and also the fact that greater reliance had been placed, both in England and Spain, upon them than future events justified. On the 26th of October 1808, when Moore's troops had left Lisbon to join Baird, the French still held a defensive position behind the Ebro; Bessières being in the basin of Vitoria. Marshal Ney north-west of Logroño, and Moncey covering Pampluna, and near Sanguesa. With the garrisons of Biscay, Navarre, and a reserve at Bayonne, their strength was about 75,000 men. Palafox (20,000) was near Saragossa and observing Sanguesa; Castaños with the victors of Baylen

1 In this account of the war the losses and numbers engaged in different battles are given approximately only; and the former include killed, wounded and missing. Historians differ much on these topics.

2 It was not, however, signed at Cintra, but at Lisbon, and was mainly negotiated near Torres Vedras.

3 The two latter were recalled from the Peninsula; Sir Arthur Wellesley had presented his London papers, and, having only signed the armistice with Junot, not the convention itself.

(34,000) west and south of Tudela and near Logroño; Blake (32,000) east of Reynosa, having captured Bilbao; Count de Vidavére (11,000) near Burgos; reserves (50,000) were assembling about Segovia, Talavera and Cordova; Catalonia was held by 23,000, and Madrid had been reoccupied.

Moore had to decide whether to join Baird by sea or land. To do so by sea at this season was to risk delay, while in moving by land he would have the Spanish armies between him and the French. For these reasons he marched by land; and as the roads north of the Tagus were deemed impassable for guns, while transport and supplies for a large force were also difficult to procure, he sent Sir John Hope, with the artillery, cavalry and reserve ammunition column, south of the river, through Badajoz to Almaraz, to move thence through Talavera, Madrid and the Escorial Pass, involving a considerable détour; while he himself, with the infantry, marching by successive divisions, took the shorter roads north of the Tagus through Coimbra and Almeida, and also by Alcantara and Coria to Ciudad Rodrigo and Salamanca. Baird was to move south through Galicia to meet him, and the army was to concentrate at Valladolid, Burgos, or whatever point might seem later on to be best. But as Moore was moving forward, the whole situation in Spain changed. Napoleon's forces, now increased to some 200,000 men present and more following, were assuming the offensive, and he himself on the 30th of September had left Paris to place himself at their head. Before them the Spaniards were routed in every direction: Castaños was defeated near Logroño (Oct. 27); Castaños and Palafox at Tudela (Nov. 23); Blake at Zornosa (Oct. 29), Espinosa (Nov. 11) and Reynosa (Nov. 13), and Belvedere at Gamonal, near Burgos (Nov. 10). Thus when Moore reached Salamanca (Nov. 28) Baird was at Astorga; Hope at the Escurril Pass; Napoleon himself at Aranda; and French troops at Valladolid, Arevalo and Segovia; so that the French were nearer than either Baird or Moore to Salamanca. Moore was ignorant of their exact position and strength, but he knew that Valladolid had been occupied, and so his first orders were that Baird should fall back to Galicia and Hope to Portugal. But these were soon changed, and he now took the important resolution of striking a blow for Spain, and for the defenders of Madrid, by attacking Napoleon's communications with France. Hope having joined him through Avila, and magazines having been formed at Benavente, Astorga and Lugo, in ease of retreat in that direction, he moved forward, and on the 13th of December approached the Douro, at and near Rueda east of Toro. Here he learnt that Madrid had fallen to Napoleon (Dec. 3) after he had by a brilliant charge of the Polish lancers and chasseurs of the Guard forced the Somosierra Pass (Nov. 30), and in another action warned the Regio commanding Madrid itself (Dec. 3); that the French were pressing on towards Lisbon and Andalusia; that Napoleon was unaware of his vicinity, and that Soult's corps, isolated on the Carrion River, had been ordered towards Benavente. He then finally decided to attack Soult (intending subsequently to fall back through Galicia) and ordered up transports from Lisbon to Corunna and Vigo; thus changing his base from Portugal to the north-west of Spain; Blake's Spanish army, now rallying under the marquis de la Romana near Leon, was to co-operate, but was able to give little effective aid.

On the 20th of December Baird joined Moore near Mayorga, and a brilliant cavalry combat now took place at Sahagun, in which the British hussar brigade distinguished itself. But on the 23rd of December, when Moore was at Sahagun and about to press on, Soult, with about 90,000 men, who were hastening towards him, so withdrew across the Esla, near Benevente (Dec. 28), destroying the bridge there. Napoleon, directly he realized Moore's proximity, had ordered Soult to cut him off from Galicia; recalled his other troops from their march towards Lisbon and Andalusia, and, with 50,000 men and 150 guns, had left Madrid himself (Dec. 22). He traversed over 100 m. in less than five days across the snow-covered Escorial Pass, reaching Tordesillas on the Douro on the 26th of December. Hence he wrote to Soult, "If the English
pass to-day in their position (which he believed to be Sahagun) they are lost." But Moore had passed Astorga by the 31st of December, where Napoleon arrived on the 1st of January 1809. Thence he turned back, with a large portion of his army towards France, leaving Soult with over 40,000 men to follow Moore.

On the "Retreat to Corunna" fatigue, wet and bitter cold, combined with the sense of an enforced retreat, shook the discipline of Moore's army; but he reached Corunna on the 11th of January 1809, where he took up a position across the road from Lugo, with his left on the river Mero. On the 14th of January the transports arrived; and on the 16th Soult attacked.

In this battle the French numbered about 20,000 with 40 guns; the British 15,000 with 9 very light guns. Soult failed to dislodge the British, and Moore was about to deliver a counter-attack when he himself fell mortally wounded. Baird was also wounded, and as night was approaching, Hope suspended the advance, and subsequently embarked the army, with scarcely any further loss. The British casualties were about 1000, the French 2000. When the troops landed in England, half clothed and half shod, their leader's conduct of the campaign was at first blamed, but his reputation as a general rests solidly upon these facts, that when Napoleon in person, having nearly 300,000 men in Spain, had stretched forth his hand to seize Portugal and Andalusia, Moore with 30,000, forced him to withdraw it, and follow him to Corunna, escaping at the same time from his grasp. Certainly a notable achievement.

Campaign in Portugal and Spain, 1809.—On the 22nd of April 1809 Sir Arthur Wellesley reached Lisbon. By this time, French armies, to a great extent controlled by Napoleon from a distance, had advanced—Soult from Galicia to capture Oporto and Lisbon (with General Lapisse from Salamanca moving on his left towards Abrantes) and Marshal Victor, still farther to the left, with a siege train to take Badajoz, Merida and subsequently Cadiz. Soult (over 20,000), leaving Ney in Galicia, had taken and sacked Oporto (March 29, 1809); but the Portuguese having closed upon his rear and occupied Vigo, he halted, detaching a force to Amarante to keep open the road to Braganza and asked for reinforcements. Victor had crossed the Tagus, and defeated Cuesta at Medellin (March 28, 1809); but, surrounded by insurgents, he also had halted; Lapisse had joined him, and together they were near Merida, 30,000 strong. On the allied side the British (25,000), including some German auxiliaries, were about Leiria: the Portuguese regular troops (16,000) near Thomar; and some thousands of Portuguese militia were observing Soult in the north of Portugal, a body under Lord Byron being at Amarante. Victory was near, but was lost. Soult had been in the organization and training of the Portuguese levies; Major-General William Carr Beresford, with the rank of marshal, was placed at their head. Of the Spaniards, Palafox, after his defeat at Tudela had most gallantly defended Saragossa a second time (Dec. 26, 1808–Feb. 20, 1809); the Catalonians, after reverses at Molins de Rey (Dec. 21, 1808) and at Valls (Feb. 25, 1809) had taken refuge in Tarragona; and Rosas had fallen (Dec. 5, 1808) to the French general Gouvion St Cyr who, having relieved Barcelona, was besieging Gerona. Romaña's force was now near Orense in Galicia. A supreme junta had been formed which could nominally assemble about 100,000 men, but jealousy among its members was rife, and they still declined to appoint any commander-in-chief.

On the 5th of May 1809, Wellesley moved towards the river Douro, having detached Beresford to seize Amarante, from which the French had now driven Silveira. Soult expected the passage of the Douro to be attempted near its mouth. With fishing craft; but Wellesley, by a daring surprise, crossed (May 12) close above Oporto, and also by a ford higher up. After some fighting Oporto was taken, and Soult driven back. The Portuguese being in his rear, and Wellesley closing with him, the only good road of retreat available lay through Amarante, but he now learned that Beresford had taken this important point from Silveira; so he was then compelled, abandoning his guns and much baggage, to escape, with a loss of some 5000 men, over the mountains of the Sierra Catalina to Salamonde, and thence to Ocaña.

During the above operations, Victor, with Lapisse, had forced the passage of the Tagus at Alcantara but, on Wellesley returning to Abrantes, he retired. News having been received that Napoleon had suffered a serious check at the battle of Aspern, near Vienna (May 22, 1809), Wellesley next determined—leaving Beresford (20,000) near Ciudad Rodrigo—to move with 22,000 men, in conjunction with Cuesta's Spanish army (40,000) towards Madrid against Victor, who, with 25,000 supported by King Joseph (50,000) covering the capital, was near Talavera. Sir Robert Wilson with 4000 Portuguese from Salamanca, and a Spanish force under Venegas (25,000) from Carolina, were to co-operate and occupy Joseph, by closing upon Madrid. Cuesta, during the advance up the valley of the Tagus, was to occupy the pass of Baños on the left flank; the Spanish authorities were to supply provisions, and Venegas was to be at Arganda, near Madrid, by the 22nd or 23rd of July; but none of these arrangements were duly carried out, and it was on this that the remainder of the campaign turned. Writing to Soult from Austria, Napoleon had placed the corps of Ney and Mortier under his orders, and said: Wellesley will most likely advance by the Tagus against Madrid; in that case, pass the mountains, and fall on him from the rear, and crush him."

By the 20th of July Cuesta had joined Wellesley at Oropesa; and both then moved forward to Talavera, Victor falling back before them; but Cuesta, irritable and jealous, would not work cordially with Wellesley; Venegas—counter-ordered it was said by the Spanish junta—did not go to Arganda, and Wilson, though he advanced close to Madrid, was forced to retire, so that Joseph joined Victor, and the united force attacked the Allies at Talavera de la Reina on the Tagus. The battle lasted for two days, and ended in the defeat of the French, who fell back towards Madrid. Owing to want of supplies, the British had fought in a half-starved condition; and Wellesley now learnt to his surprise that Soult had passed the mountains and was in his rear. Having turned about, he was on the march to attack him, when he heard (Aug. 23) that not Soult's corps alone, but three French corps, had come through the pass of Baños without opposition; that Soult himself was at Naval Moral, between him and the bridge of Almaraz on the Tagus, and that Cuesta was retreating from Talavera. Wellesley's force was now in a dangerous position; but by withdrawing at once across the Tagus at Arozabebo, he reached Jaraicejo and Almaraz (by the south bank) before Venegas got on the bridge at Almaraz, and thence moved, through Merida, northwards to the banks of the Aguete, commencing to fortify the country around Lisbon.

Elsewhere in the Peninsula during this year, Blake, now in Catalonia, after routing Suchet at Alcaniz (May 23, 1809), was defeated by him at Maria (June 15) and at Belchite (June 18); Venegas, by King Joseph and Sébastiani, at Almonacid on the 11th of August; Del Parque (20,000), after a previous victory near Salamanca (Oct. 18), was overthrown at Alba de Tormes by General Marchand (Nov. 28); the old forces of Venegas and Cuesta (50,000), now united under Areizaga, were decisively routed by King Joseph at Ocaña (Nov.19); and Gerona after a gallant defence, had surrendered to Augereau (Dec. 10).

Sir Arthur Wellesley was for this campaign created Baron Douro and Viscount Wellington. He was made captain-general by Spain, and marshal-general by Portugal. But his experience after Talavera had been akin to that of Moore; his expectations from the Spaniards had not been realized; he had been almost intercepted by the French, and he had narrowly escaped from a critical position. Henceforth he resisted all proposals for joint operations, on any large scale, with Spanish armies not under his own direct command.

*After the battle the Light Division, under Robert Craufurd, joined Wellesley. In the endeavour to reach the field in time it had covered, in heavy marching order, over 90 m. in 25 hours, in hot July weather.*
Campaign in Portugal, 1810.—Napoleon, having avenged Aspern by the victory of Wagram (July 6, 1809), despatched to Spain large reinforcements destined to reinforce his army there to about 370,000 men. Marshal Masséna with 120,000, including the corps of Ney, Junot, Reynier and some of the Imperial Guard, was to operate from Salamanca against Portugal; but first, Soult, appointed major-general of the army in Spain, entered the headquarters of the (equivalent of chief of the staff), was, with the corps of Victor, Mortier and Sébastiani (70,000), to reduce Andalusia. Soult (Jan. 31, 1810) occupied Seville and escaping thence to Cadiz, the Supreme Junta resigned its powers to a regency of five members (Feb. 2, 1810). Cadiz was invested by Victor's corps (Feb. 4), and then Soult halted, waiting for Masséna, who arrived at Valadolid on the 15th of May.

In England a party in parliament were urging the withdrawal of the British troops, and any reverse to the allied armies would have strengthened its hands. Wellington's policy was thus cautious and defensive, and he had already commenced the since famous lines of Torres Vedras round Lisbon. In June 1810 his headquarters were at Celo. With about 35,000 British, 30,000 Portuguese regular troops and 30,000 Portuguese militia, he watched the roads leading into Portugal past Ciudad Rodrigo to the north, and Badajoz to the south of the Tagus, as also the line of the Douro and the country between the Elga and the Pousal. Soult having been instructed to concentrate his Badajoz and Elvas, Masséna, early in June 1810, moved forward, and Ciudad Rodrigo surrendered to him (June 10). Next pushing back a British force under Craufurd, he invested Almeida, taking it on the 27th of August. Then calling up Reynier, who during this had moved on his left towards Alcântara, he marched down the right bank of the Mondego, and entered Viseu (Sept. 21). Wellington fell back before him down the left bank, ordering up Rowland Hill's force from the Badajoz road, the peasantry having been previously called upon to destroy their crops and retire within the lines of Torres Vedras. A little north of Coimbra, the road which Masséna followed crossed the Sierra de Bussaco (Busaco), a very strong position where Wellington resolved to offer him battle. Masséna, superior in numbers and over-confident, made a direct attack upon the heights on the 27th of September 1810: his strength being about 60,000, while that of the Allies was about 35,000, of whom nearly half were Portuguese. After a stern conflict the French were repulsed, the loss being five generals and nearly 5000 men, while the Allies lost about 1300. The next day Masséna turned the Spanish Pass and Sardo, which latter place, owing to an error, had not been occupied by the Portuguese, and Wellington then retreated by Coimbra and Leiria, to the lines, which he entered on the 11th of October, having within them fully 100,000 able-bodied men.

The celebrated "Lines of Torres Vedras" were defensive works designed to resist any army which Napoleon could send against them. They consisted of three great lines, strengthened by about 150 redoubts, and earthworks of various descriptions, mounting some 600 cannon; the outer line, nearly 30 m. long, stretching over heights north of Lisbon, from the Tagus to the sea. As Masséna advanced, the Portuguese closing upon his rear retook Coimbra (Oct. 7), and when he neared the lines, astounded at their strength, he sent General Foy to the emperor to ask for reinforcements. After an effort, defeated by Hill, to cross the Tagus, he withdrew (Nov. 15) to Santarem. This practically closed Wellington's operations for the year 1810, his policy now being not to lose men in battle, but to reduce Masséna by hunger and distress.

In other parts of Spain, Augereau had taken Hestalrich (May 10); captured Leiria (May 14); Mequinzena (June 8); and invested Tortosa (Dec. 15). The Spanish levies had been unable to contribute much further aid to the Allies; the French having subdued almost all Spain, and being now in possession of Ciudad Rodrigo and Almeida. On the other hand Wellington still held Lisbon with parts of Portugal, Elvas and Badajoz, for Soult had not felt disposed to attempt the capture of the last two fortresses.

Campaign of 1811.—Napoleon, whose attention was now directed towards Russia, refused to reinforce Masséna, but enjoined Soult to aid him by moving against Badajoz. Soult, therefore, leaving Victor before Cadiz, invested Badajoz (Jan. 31) and took it from the Spaniards (March 10). With the hope of raising the blockade of Cadiz, a force under Sir Thomas Graham (afterwards Lord Lynedoch [q.v.]) left that harbour by sea, and joining with Spanish troops near Tarifa, advanced by land against Victor's blockading force, a Spanish general, La Peña, being in chief command. As they neared Barrosa, Victor attacked them, the Allies numbering in the battle about 13,000 with 24 guns, 4000 being British; the French 9000, actually engaged, with 14 guns; but with 5000 more a few miles off and others in the French lines. Hard fighting, chiefly between the French and British, now ensued, and at one time the Barrosa ridge, the key of the position left by La Peña's orders, practically undefended, fell into the French hands: but Graham by a resolute counter-attack regained it, and Victor was in the end driven back. La Peña, who had in the battle itself failed to give proper support to Graham, would not pursue, and Graham declining to carry on further operations with him, re-entered Cadiz. The French afterwards resumed the blockade, so that although Barrosa was an allied victory, its object was not attained. The British loss was about 1200; the French 6000, 6 guns and an eagle.

On the day of the above battle Masséna, having destroyed what guns he could not horse, and skillfully gained time by a feint against Abrantes, began his retreat from before the lines, through Coimbra and Espinal. His army was in serious distress; he was in want of food and supplies; most of his horses were dead, and his men were deserting. Wellington followed, directing the Portuguese to remove all boats from the Mondego and Douro, and to break up roads north of the former river. Beresford was detached to succour Badajoz, but was soon recalled, as it had fallen to Soult. Ney, commanding Masséna's rearguard, conducted the retreat with great ability. In the pursuit, Wellington adhered to his policy of husbarding his troops for future offensive operations, and let sickness and hunger do the work of the sword. This they effectively did. Nothing could well exceed the horrors of Masséna's retreat. Rearguard actions were fought at Pombal (March 10), Redinha (March 12) and Condeixa (March 13). Here Ney was directed to make a firm stand; but, ascertaining that the Portuguese were at Coimbra and the bridge there broken, and fearing to be cut off also from Murcilla, he burnt Condeixa, and marched to Cazal Nova. An action took place here (March 14) and at Pous d'Arouce (March 15). Wellington now sent off Beresford with a force to retake Badajoz; and Masséna, sacrificing much of his baggage and ammunition, reached Celorico and Guarda (March 21). Here he was attacked by Wellington (March 29) and, after a further engagement at Sabugal (April 3, 1811), he fell back through Ciudad to Salamanca, having lost in Portugal nearly 30,000 men, chiefly from want and disease, and 6000 in the retreat alone.

The key to the remaining operations of 1811 lies in the importance attached by both Allies and French to the possession of the fortresses which guarded the two great roads from Portugal into Spain—Almeida and Ciudad Rodrigo on the northern, and Badajoz and Elvas on the southern road; all these except Elvas were in French hands. Wellington, on the 9th of April 1811, directed General Spencer to invest Almeida; he then set off himself to Join Beresford before Badajoz, but after reconnoitring the fortress with his lieutenant he had at once to return north on the news that Masséna was moving to relieve Almeida. On the 3rd of May Loison attacked him at Fuentes d'Oñor near Almeida, and Masséna coming up himself made a more serious attack on the 5th of May. The Allies numbered about 33,000, with 42 guns; the French 45,000 with 120 guns. The battle is chiefly notable for the steady stubbornness with which the allied right, covered by the Light Division in squares, changed position in presence of the French

Battle of Barrosa, March 5, 1811.

Masséna's Retreat.
PENINSULAR WAR

cavalry; and for the extraordinary feat of arms of Captain Norman Ramsay, R.H.A., in charging through the French cavalry with his guns. Massena failed to dislodge the Allies, and on the 8th of May withdrew to Salamanca, Almeida falling to Wellington on the 11th of May 1811. The allied loss in the fighting on both days at Fuentes d’Onor was about 1500: the French 3000.

In the meantime Soult (with 23,000 men and 50 guns), advancing to relieve Badajoz, compelled Beresford to suspend the siege, and to take up a position with about 30,000 men (of whom 7000 were British) and 38 guns behind the river Albuera (or Albuera). Here Soult attacked him on the 16th of May. An unusually bloody battle ensued, in which the French efforts were chiefly directed against the allied right, held by the Spaniards. At one time the right appeared to be broken, and 6 guns were lost, when a gallant advance of Sir Lowry Cole’s division restored the day, Soult then falling back towards Seville. The allied loss was about 7000 (including about half the British force); the French about 8000.

After this Wellington from Almeida rejoined Beresford and the siege of Badajoz was continued: but now Marshal Marmont, having succeeded Masséna, was marching southwards to join Soult, and, two allied assaults of Badajoz having failed, Wellington withdrew. Subsequently, leaving Hill in the Almeitejo, he returned towards Almeida, and with 40,000 men commenced a blockade of Ciudad Rodrigo, his headquarters being at Fuente Guinaldo. Soult and Marmont now fell back, the former to Seville, the latter to the valley of the Tagus, south of the pass of Baños.

In September, Marmont joined with the army of the north under General Dorsenne, coming from Salamanca—their total force being 80,000, with 100 guns—and succeeded (Sept. 25) in introducing a convoy of provisions into Ciudad Rodrigo. Before so superior a force, Wellington had not attempted to maintain the blockade; but on Marmont afterwards advancing towards him, he fought a rearguard action with him at El Bodon (Sept. 25), notable, as was Fuentes d’Onor, for the coolness with which the allied squares retired amidst the enemy’s horsemen; and again at Fuente Guinaldo (Sept. 25 and 26) he maintained for 30 hours, with 15,000 men, a bold front against Marmont’s army of 60,000, in order to save the Light Division from being cut off. At Aldea de Ponte there was a further sharp engagement (Sept. 27), but Wellington taking up a strong position near Sabugal, Marmont and Dorsenne withdrew once more to the valley of the Tagus and Salamanca respectively, and Wellington again blockaded Ciudad Rodrigo.

Thus terminated the main operations of this year. On the 28th of October 1811, Hill, by a very skillful surprise, captured Arroyo de los Molinos (between Badajoz and Trujillo), almost annihilating a French corps under Gérard; and in December 1811 the French were repulsed in their efforts to capture Tarifa near Cadiz. In the east of Spain Suchet took Tortosa (Jan. 1, 1811); Tarragona (June 28); and Murviedro (Oct. 26), defeating Blake’s relieving force, which then retired in Valencia. MacDonald also retook Figueras which the Spaniards had taken on the 9th of April 1811 (Aug. 10). Portugal had now been freed from the French, but they still held Ciudad Rodrigo and Badajoz, the two main gates into Spain.

Campaign in Spain, 1812.—The campaign of 1812 marks an important stage in the war. Napoleon, with the Russian War in prospect, had early in the year withdrawn 30,000 men from Spain; and Wellington had begun to carry on what he termed a war of “magazines.” Based on rivers (the navigation of which greatly improved after the sea), he formed depots or magazines of provisions at many points, which enabled him always to take and keep the field. The French, on the other hand, had great difficulty in establishing any such reserves of food, owing to their practice of depending for sustenance entirely upon the country in which they were quartered. Wellington assumed the offensive, and by various movements and feints, aided the guerrilla bands by forcing the French corps to assemble in their districts, which not only greatly harassed them but also materially hindered the combination of their corps for concerted action. Having secretly got a battering train into Almeida and directed Hill, as a blind, to engage Soult by threatening Badajoz, he suddenly (Jan. 8, 1812) besieged Ciudad Rodrigo.

The French, still numbering nearly 200,000, now held the following positions: the Army of the North—Dorsenne (48,000)—was about the Pisuerga, in the Asturias, and along the northern coast; the Army of Portugal—Marmont’s (59,000)—mainly in the valley of the Tagus, but ordered to Salamanca; the Army of the South—Soult (35,000)—in Andalusia; the Army of the Centre—Joseph (19,000)—about Madrid.

The siege of Ciudad Rodrigo was calculated in the ordinary course to require twenty-four days: but on it becoming known that Marmont was moving northward, the assault was delivered after twelve days only (Jan. 19). The gallantry of the troops made it successful, though, with the loss of Generals Craufurd and McKinnon, and 1200 men, and Marmont’s battering train of 150 guns, fell into the allied hands. Then, after a feint of passing on into Spain, Wellington rapidly marched south and, with 22,000 men, laid siege to Badajoz (March 17, 1812), Hill with 30,000 covering the siege near Merida. Wellington was hampered by want of time, and had to assault prematurely. Soult and Marmont having begun to move to relieve the garrison, the assault was delivered on the night of the 7th of April, and though the assailants failed at the breaches, the carnage at which was terrible, a very daring escadade of one of the bastions and of the castle succeeded, and Badajoz fell, Soult’s pontoon train being taken in it. After the assault, some deplorable excesses were committed by the victorious troops. The allied loss was 3600 in the assault alone and 5000 in the entire siege.

The Allies had now got possession of the two great gates into Spain: and Hill, by an enterprise most skilfully carried out, destroyed (May 19) the Tagus bridge at Almaraz, by which Soult to the south of the river chiefly communicated with Marmont to the north. Wellington then, ostentatiously making preparations to enter Spain by the Badajoz line, once more turned northward, crossed the Tormes (June 17, 1812), and advanced to the Douro, behind which the French were drawn up. Marmont had erected at Salamanca some strong forts, the reduction of which occupied Wellington ten days, and cost him 600 men. The Allies and French now faced each other along the Douro to the Pisuerga. The river was high, and Wellington hoped that want of supplies would compel Marmont to retire, but in this he was disappointed.

On the 15th of July 1812 Marmont, after a feint against Wellington’s left, suddenly, by a forced march, turned his right, and made rapidly towards the fords of Huerta and Alba on the Tormes. Some interesting manoeuvres now took place, Wellington moving parallel and close to Marmont, but more to the north, making for the fords of Aldea Lengua and Santa Marta on the Tormes nearer to Salamanca, and being under the belief that the Spaniards held the castle and ford at Alba on that river. But Marmont’s manoeuvring and marching power had been underestimated, and on the 21st of July while Wellington’s position covered Salamanca, and but indirectly his line of communications through Ciudad Rodrigo, Marmont had reached a point from which he hoped to interpose between Wellington and Portugal, on the Ciudad Rodrigo road. This he endeavored to do on the 22nd of July 1812, which brought on the important battle of Salamanca (q.v.) in which Wellington gained a victory over Marmont, driving back to Valladolid and thence to Burgos. July 22, 1812. Wellington entered Valladolid (July 30), and thence marched against Joseph, who (July 21) had reached Blasco Sancho with reinforcements for Marmont. Joseph retired before him, and Wellington entered Madrid (Aug. 12, 1812), where, in the Retiro, 1700 men, 180 cannon, two eagles, and a quantity of stores were captured. Soult now raised the siege of Cadiz (Aug. 26), and evacuating Andalusia joined Suchet.
with some 55,000 men. Wellington then brought up Hill to Madrid.

On the 1st of September 1812, the French army had begun once more to collect together, Wellington marched against the Army of the North, now under General Clausel, and laid siege to the castle of Burgos (Sept. 19) to secure the road towards Santander on the coast. But the strength of the castle had been underrated; Wellington had insufficient siege equipment and transport for heavy guns; five assaults failed, and Soult (having left Suchet in Valencia) and also the Army of Portugal were both approaching, so Wellington withdrew on the night of the 21st of October, and, directing the evacuation of Madrid, commenced the "Retreat from Burgos."

In this retreat, although military operations were skillfully conducted, the Allies lost 7000 men, and discipline, as in that to Corunna, became much relaxed.

By November 1812, Hill having joined him at Salamanca, Wellington once more had gone into cantonments near Ciudad Rodrigo, and the French army had again scattered for convenience of supply. In spite of the failure before Burgos, the success of the campaign had been brilliant. In addition to the decisive victory at Salamanca, Madrid had been occupied and the siege of Cadiz raised, Andalusia secured, and Ciudad Rodrigo and Badajoz stormed. Early in January also the French had abandoned the siege of Tarifa, though Valencia had surrendered to them (Jan. 9). One important result of the campaign was that the Spanish Cortes nominated Wellington (Sept. 22, 1812) to the unfettered command of the Spanish armies. For the operations of this campaign Wellington was created earl, and subsequently marquis of Wellington; duke of Ciudad Rodrigo by Spain, and marquis of Torres Vedras by Portugal.

Campaign in Spain and the South of France, 1813.—At the opening of 1813, Suchet, with 63,000 men, had been left to hold Valencia, Aragon and Catalonia; and the remainder of the French (about 137,000) occupied Leon, the central provinces and Biscay, guarding also the communications with France. Of these about 60,000 under Joseph were more immediately opposed to Wellington, and posted, in scattered detachments, from Toledo and Madrid behind the Torres to the Douro, and along that river to the Esla. Wellington had further organized the advanced force of 25,000 at Cadiz, with great energy, and Joseph, the siege of Cadiz raised, Andalusia secured, Ciudad Rodrigo and Badajoz stormed. Early in January also the French had abandoned the siege of Tarifa, though Valencia had surrendered to them (Jan. 9). One important result of the campaign was that the Spanish Cortes nominated Wellington (Sept. 22, 1812) to the unfettered command of the Spanish armies. of the Iris-Bayonne road, along mountain spurs to the Great Rhine, 2800 ft. high. The decisive movement was a passage in strength near Fuenterrabia, to the astonishment of the enemy, who, in view of the width of the river and the shifting sands, had thought the crossing impossible at that point. The French right was then rolled back, and Soult was unable to reinforce his right in time to retrieve the day. His works fell in succession after hard fighting, and he withdrew towards the river Nivelle. The loss was about—Allies, 1600; French, 1400. The passage of the Bidassoa “was a general’s not a soldiers’ battle” (Napier).

On the 31st of October Pampeluna surrendered, and Wellington was now anxious to drive Suchet from Catalonia before further invading France. The British government, however, in the interests of the continental powers, urged an immediate advance, so on the night of the 9th of November 1813 he brought up his right from the Pyrenean passes to the northward of Maya and towards the Nivelle. Soult’s army (about 70,000), in three entrenched lines, stretched from the sea in front of St Jean de Luz along commanding ground to Amotz and then, behind the river, to Mont Mondarin near the Nive. Each army had with it about 100 guns; and, during a heavy cannonade, Wellington on the 10th of November attacked this extended position of 16 m. in five columns, these being (so as to the Nivelle, Nov. 10, 1813) a mass of about 50,000 men converged towards the French centre near Amotz, where, after hard fighting, it swept away the 18,000 of the second line there opposed to it, cutting Soult’s army in two. The French right then fell back to St Jean de Luz, the left towards the Nive. It was now late and the Allies, after moving a few miles down both banks of the Nivelle, bivouacked, while Soult, taking advantage of the respite, withdrew in the night to Bayonne. The allied loss was about 2700; that of the French 4000, 51 guns, and all their magazines. The next day Wellington closed in upon Bayonne from the sea to the left bank of the Nive.

After this there was a period of comparative inaction, though during it the French were driven from the bridges at Urdains and Cambo. The weather had become bad, and the Nive unfordable; but there were additional and serious causes of delay. The Portuguese and Spanish authorities were neglecting the payment and supply of their troops. Wellington had also difficulties of a similar kind with his own government, and also the Spanish soldiery, in revenge for many French outrages, had become gory of grave excesses in France, so that Wellington took the extreme step of sending 25,000 of them back to Spain and resigning the command of his army, though his resignation was subsequently withdrawn. So great was the tension at this crisis that a rupture with Spain seemed possible. These matters, however, having been at length adjusted, Wellington, who in his cramped position between the sea and the Nive could not use his cavalry or artillery effectively, or interfere with the French supplies coming through St Jean Pied de Port, determined to occupy the right as far as the left bank of the Nive. He could not rely on the left bank with his whole force held Bayonne, without exposing his own communications through Irun. Therefore, on the 6th of December 1813, after making a demonstration elsewhere, he effectuated the passage with a portion of his force only under Hill and Beresford, near Ustaritz and Cambo, his loss being slight, and thence pushed down the river towards Villefranque, where Soult barred his way across the road to Bayonne. The allied army was now divided into two portions by the Nive; and Soult from Bayonne at once took advantage of his central position to attack it with all his available force, first on the left bank and then on the right. On the morning of the 10th of December he fell, with 60,000 men and 40 guns, upon Hope, who with 30,000 men and 24 guns held a position from the sea, 3 m. south of Biarritz on a ridge behind two lakes (or tanks) through Arcangues towards the Nive. Desperate fighting now ensued, but fortunately, owing to the intersected ground, Soult was compelled to advance slowly, and in the end, Wellington coming with Beresford from the right bank, the French retired baffled. On the 15th and 16th of December there were engagements of a less striking character, and finally on the 13th of December Soult with 35,000 men made a vehement attack upon the right bank of the Nive against Hill, who with about 14,000 men occupied some heights from Villefranque past St Pierre (Lostenia) to Vieux Moguerre. The conflict about St Pierre (Lostenia) was one of the most bloody of the war; but for hours Hill maintained his ground, and finally repulsed the French before Wellington, delayed by his pontoon bridge over the Nive having been swept away, arrived to his aid. The losses in the four days’ fighting in the battles before Bayonne (or battles of the Nive) were—Allies about 5000, French about 7000. Both the British and Portuguese artillery, as well as infantry, greatly distinguished themselves in these battles.

In eastern Spain Suchet (April 11, 1813) had defeated Elio’s Murcians at Yecla and Villena, but was subsequently routed by Sir John Murray1 near Castalla (April 13), who then besieged Tarragona. The siege was abandoned after a time, but was renewed in May, and Suchet, after the battle of Vitoria, evacuated Tarragona (Aug. 17) but defeated Bentinck in the combat of Ordal (Sept. 13).

Campaign in the South of France, 1814.—When operations recommenced in February 1814 the French line extended from Bayonne up the north bank of the Adour to the Pau, thence bending south along the Bidouze to St Palais, with advanced posts on the Joyeuse and at St Jean Pied de Port. Wellington’s left, under Hope, watched Bayonne, while Beresford, with Hill, observed the Adour and the Joyeuse, the right trending back till it reached Urcuray on the St Jean Pied de Port road. Exclusive of the garrison of Bayonne and other places, the available field force of Soult numbered about 47,000, while that of the Allies, deducting Hope’s force observing Bayonne, was of much the same strength. It had now become Wellington’s object to draw Soult away from Bayonne, in order that the allied army might, with less loss, cross the Adour and lay siege to the place on both banks of the river.

At its mouth the Adour was about 500 yds. wide, and its entrance from the sea by small vessels, except in the finest weather, was a perilous undertaking, owing to the shifting sands and a dangerous bar. On the other hand, the deep sandy soil near its banks made the transport of bridging matériel by land laborious, and almost certain of discovery. Wellington, convinced that no effort to bridge below Bayonne would be expected, decided to attempt it there, and collected at St Jean Pied de Port and Passages a large number of country vessels (termed chasse-marees). Then, leaving Hope with 30,000 men to watch Bayonne, he began an enveloping movement round Soult’s left. Hill on the 14th and 15th of February, after a combat at Garris, drove the French posts beyond the Joyeuse; and Wellington then pressed these troops back over the Bidouze and gave de Mauleon to the Gave d’Oloron. Wellington’s object in this was to once at once, for Soult, leaving only 10,000 men in Bayonne, came out and concentrated at Orthes on the Pau. Then Wellington (Feb. 17) proceeded to St Jean de Luz and the dispatch of boats to the Adour. Unavourable weather, however, compelled him to leave this to Sir John Hope and Admiral Penrose, so returning to the Gave d’Oloron he crossed it, and faced Soult on the Pau (Feb. 25). Hope in the meantime, after feints higher up the Adour, succeeded (Feb. 22 and 23) in passing 600 men across the river in boats. The nature of the ground, and there being no suspicion of an attack at this point, led to the French coming out very tardily to oppose them; and when they did, some Congreve rockets (then a novelty) threw them into confusion, so that the right bank was held until, on the morning of the 24th, the flotilla of

1 Commander of a British expedition from the Mediterranean islands.

2 “Gave” in the Pyrenees means a mountain stream or torrent.
chasse-maîtres appeared from St Jean de Luz, preceded by men-of-war boats. Several men and vessels were lost in crossing the bar; but by noon on the 26th of February the bridge of 26 vessels had been thrown and secured; batteries and a boom placed to protect it, 8000 troops passed over, and the enemy's gunboats driven up the river. Bayonne was then invested on both banks as a preliminary to the siege.

On the 27th of February Wellington, having with little loss effected the passage of the Pau below Orthes, attacked Soulé. In this battle the Allies and French were of about equal strength (37,000): the former having 48 guns, the latter 40. Soulé held a strong position behind Orthes on heights commanding the roads to Dax and St Sever. Beresford was directed to turn his right, if possible cutting him off from Dax, and Hill his left towards the St Sever road. Beresford's attack, after hard fighting over difficult ground, was repulsed, when Wellington, perceiving that the pursuing French had left a central part of the heights unoccupied, thrust up the Light Division into it, between Soulé's right and centre. At the same time Hill, having found a ford above Orthes, was turning the French left, when Soulé retreated just in time to save being cut off, withdrawing towards St Sever, which he reached on the 28th of February. The allied loss was about 2000; the French 4000 and guns.

From St Sever Soulé turned eastwards to Aire, where he covered the roads to Bordeaux and Toulouse. Beresford, with 12,000 men, was now sent to Bordeaux, which opened its gates as promised to the Allies. Driven by Hill from Aire on the 2nd of March 1814, Soulé retired by Vic Bigorre, where there was a combat (March 16), and Tarbes, where there was a severe action (March 20), to Toulouse behind the Garonne. He endeavoured also to rouse the French peasantry against the Allies, but in vain, for Wellington's justice and moderation afforded them no grievances. Wellington wished to pass the Garonne above Toulouse in order to attack the city from the south—its weakest side—and interpose between Soulé and Suchet. But finding it impracticable to operate in that direction, he left Hill on the west side and crossed at Grenade below Toulouse (April 3). When Beresford, who had now rejoined Wellington, had passed over, the bridge was swept away, which left him isolated on the right bank. But Soulé did not attack; the bridge (April 8) was restored; Wellington crossed the Garonne and the Ers, and attacked Soulé on the 10th of April. In the battle of Toulouse the French numbered about 40,000 (exclusive of the local National Guards) with 80 guns; the Allies under 52,000 with 64 guns. Soulé's position to the north and east of the city, consisting of the canal of Languedoc, some fortified suburbs, and to the extreme east the commanding ridge of Mont Rave, crowned with redoubts and earthworks. Wellington's columns, under Beresford, were now called upon to make a flank march of some two miles, under artillery, and occasionally musketry, fire, being threatened also by cavalry, and then, while the Spanish troops assaulted the north of the ridge, to wheel up, mount the eastern slope, and carry the works. The Spaniards were repulsed, but Beresford gallantly took Mont Rave and Soulé fell back behind the canal. On the 12th of April Wellington advanced to invest Toulouse from the south, but Soulé on the night of the 11th had retreated towards Villefranque, and Wellington then entered the city. The allied loss was about 5000; the French 3000. Thus, in the last great battle of the war, the courage and resolution of the soldiers of the Peninsular army were conspicuously illustrated.

On the 13th of April 1814 officers arrived with the announcement to both armies of the capture of Paris, the abdication of Napoleon, and the practical conclusion of peace; and on the 18th a convention, which included Suchet's force, was entered into between Wellington and Soulé. Unfortunately, after Toulouse had fallen, the Allies and French, in a sortie from Bayonne on the 14th of April, each lost about 1000 men: so that some 10,000 men fell after peace had virtually been made.

In the east, during this year (1814), Sir W. Clinton had, on the 16th of January, attacked Suchet at Molins de Rey and blockaded Barcelona (Feb. 7); the French posts of Lerida, Mequinenza and Monzon had also been yielded up, and Suchet, on the 2nd of March, had crossed the Pyrenees into France. Figueras surrendered to Cuesta before the end of May; and peace was formally signed at Paris on the 30th of May.

Thus terminated the long and sanguinary struggle of the Peninsular War. The British troops were partly sent to England, and partly embarked at Bordeaux for America, with which country war had broken out (see American War of 1812-15) the Portuguese and Spanish recrossed the Pyrenees: the French army was dispersed throughout France: Louis XVIII. was restored to the French throne: and Napoleon was permitted to reside in the island of Elba, the sovereignty of which had been conceded to him by the allied powers. For the operations of this campaign Wellington was created marquess of Douro and duke of Wellington (1813); and peerages were conferred upon Beresford, Graham and Hill.

The events of the Peninsular War, especially as narrated in the Wellington Despatches, are replete with instruction not only for the soldier, but also for the civil administrator. Even in a brief summary of the war one salient fact is noticeable, that all Wellington's reverses were in connexion with his sieges, for which his means were never adequate. In his many battles he was always victorious, his strategy eminently successful, his organizing and administrative power exceptionally great, his practical resource unlimited, his soldiers most courageous; but he never had an army fully complete in its departments and warlike equipment. He had no adequate corps of sappers and miners, or transport train. In 1812 tools and material of war for his sieges were often insufficient. In 1813, when he was before San Sebastian, the ammunition ran short; a battering train, long demanded, reached him not only some time after it was needed, but even then with only one day's provision of shot and shell. For the siege of Burgos heavy guns were available in store on the coast; but he neither had, nor could procure, the transport to bring them up. By resource and dogged determination Wellington rose superior to almost every difficulty, but he could not overcome all; and the main teaching of the Peninsular War turns upon the value of an army that is completely organized in its various branches before hostilities break out.

The Penitentials

General Crawford and his Light Division (London, 1801); Sir George Larpert, Private Journal of F. S. Larpert during the Peninsula War (London, 1865); Major-General H. D. Hutchinson, Operations in the Peninsula, 1808-9 (London, 1905); The Dickson MSS., being Journals of Major-General Sir Alexander Dickson during the Peninsula War (Woolwich, 1907).

PENISCOLA, a town of eastern Spain, in the province of Castellón de la Plana, and on the Mediterranean Sea, 5 m. by road S. of Benicaló. Pop. (1900), 3142. Peniscola, often called the Gibraltar of Valencia, is a fortified seaport, with a lighthouse, built on a rocky headland about 220 ft. high, and only joined to the mainland by a narrow strip of sand. Originally a Moorish stronghold, it was captured in 1233 by James I. of Aragon, who entrusted it to the Knights Templar. In the 14th century it was garrisoned by the knights of Montesa, and in 1426 it reverted to the Crown. From 1415 it was the home of the schismatic pope Benedict XIII. (Pedro de Luna), whose name is commemorated in the Bufador de Papa Luna, a curious cavern with a landward entrance through which the sea-water escapes in clouds of spray.

Penitential (Lat. poenitentiale, libellus poenitentialis, &c.), a manual used by priests of the Catholic Church for guidance in assigning the penance due to sins. Such manuals played a large rôle in the early middle ages, particularly in Ireland, England, and Norway. In Spain their influence in the moral education of the barbarous races has not received sufficient attention from historians. They were mainly composed of canons drawn from various councils and of dicta from writings of some of the fathers. Disciplinary regulations in Christian communities are referred to from the very borders of the apostolic age, and a system of careful oversight of those admitted to the mysteries developed steadily as the membership grew and dangers of contamination with the outside world increased. These were the elaborate precautions of the catechumenate, and—as a bulwark against the persecutions—the rigid system known as the Discipline of the Secret (disciplina arcana). The treatment of the lapsed, which produced the Novatian heresy, was also responsible for what has frequently been referred to as the first penitential. This is the *libellus* in which, according to Cyprian (Ep. 51), the decrees of the African synods of 251 and 253 were embodied for the guidance of the clergy in dealing with their repentant and returning flocks. This manual, which has been lost, was evidently not like the code-like compilations of the 8th century, and it is somewhat misleading to speak of it as a penitential. Jurisdiction in penance, however, was too closely limited to the upper ranks of the clergy to call forth such literature. Besides the bishop an official well versed in the penitential regulations of the Church, called the poenitentiarus, assigned due penalties for sins. For their guidance there was considerable conciliar legislation (e.g. Ancya, Nicaea, Neocaesarea, &c.), and certain patristic letters which had acquired almost the force of decreals. Of the latter the most important were the three letters of St Basil of Caesarea (d. 379) to Bishop Amphilocho of Iconium containing over eighty headings.

Three things tended to develop these rules into something like a system of penitential law. These were the development of auricular confession and private penance; the extension of the penitential jurisdiction among the clergy owing to the growth of a parochial priesthood; and the necessity of adapting the penance to the primitive ideas of law prevailing among the newly converted barbarians, especially the idea of compensation by the *wergild*. In Ireland in the middle of the 5th century appeared the "canons of St Patrick." In the first half of the next century the so-called Poenitentiarum were promulgated by St Finian (d. 552). At the same time the Celtic British Church produced the penitentials of St David of Menevia (d. 544) and of Gildas (d. 583) in addition to synodal legislation. These furnished the material to Columban (d. 615) for his Liber de poenientia and his monastic rule, which had a great influence upon the continent of Europe. The Anglo-Saxon Church was later than the Irish, but under Theodore of Tarsus (d.690), archbishop of Canterbury, the practice then in force was made the basis of the most important of all penitentials. The *Poenitentiale Theodori* became the authority in the Church's treatment of sinners for the next four centuries, both in England and elsewhere in Europe. The original text, as prepared by a disciple of Theodore, and embodying his decisions given in Haddan and Stubbs's Councils and Ecclesiastical Documents relating to Great Britain and Ireland (iii. 173 seq.), is a *Poenitentiale Commune* (St Cuman), dating apparently from the early 8th century, was the third main source of Frankish penitentials. The extent and variety of this literature led the Gallican Church to exercise a sort of censorship in order to secure uniformity. After numerous synods, Bishop Haltigar of Cambrai was commissioned by Ebo of Reims in 829 to prepare a definitive edition. Haltigar used, among his other materials, a so-called *poenitentiale romanum*, which was really of Frankish origin. The canons printed by David Wilkins in his Concilia (1737) as being by Egcbert of York (d. 767) are largely a translation into Anglo-Saxon of three books of Haltigar's penitentials. In 841 Harbanus Maurus undertook a new Liber *poenitentium* and wrote a long letter on the subject to Heribald of Auxerre about 853. Then followed the treatise of Regimini of Prum in 906, and finally the collection made by Burchard, bishop of Worms, between 1012 and 1023. The codification of the canon and the moral character of penance in the 12th century closed the history of penitentials.

Much controversy has arisen over the question whether there was an official papal penitential. It is claimed that (quite apart from Haltigar's *poenitentiale romanum*) such a set of canons existed early in Rome, and the attempt has been made by H. J. Schmitz in his learned treatise on penitentials (Bussbücher und das kanonische Busserverfahren, 1853 and 1868) to establish their pontifical character. The matter is still in dispute, Schmitz's thesis not having met with universal acceptance.

In addition to the works mentioned above the one important work on the penitentials was L. W. H. Wasserschleben's epoch-making study and collection of texts, Die Busserordnungen der abendländischen Kirche, nebst einer rechtsgeschichtlichen Einleitung (Halle, 1911). See also articles in Wetzer and Welte's Kirchenlexikon, Hauck's Realencyclopadie, and Haddan and Stubbs's Councils. See also Seebass in Zeitschrift für Kirchengeschichte, xviii. 35. On the canons of St Patrick see the Life of St Patrick by J. B. Bury (pp. 233-275).

PENITENTIARY (med. Lat. poenitentiarium, from poenentia, penance, poena, punishment, a term used both as adjective and substantive, referring either to the means of repentance or to the punishment to which ecclesiastical law subjected the penitent, as the equivalent both of the Latin *poenitentia*, "penitent priest," and *poenitentiarus*, the dignity or office of a *poenintarius*. By an extension of the latter sense the name is applied to the department of the Roman Curia known as the apostolic penitentiary (sacra *poenitentiaria apostolica*), presided over by the cardinal grand penitentiary (major *poenitentiarius*, Ital. *penitenziere maggiore*) and having jurisdiction more particularly in all questions in *foro interno* reserved for the Holy See (see CURIA ROMANA). In general, the *poenitentiarius*, or penitentiary priest, is in each diocese what the grand penitentiary is at Rome, i.e. he is appointed to deal with all cases of conscience reserved for the bishop. In the Eastern Church there are very early notices of such appointments; so far as the West is concerned, Hinschius (Kirchenrecht, i. 428, note 2) quotes from the chronicle of Bernold, the monk of St Blaise (c. 954-1100), as the earliest record of such an appointment, that made by the papal legate Odo of Ostia in 1054. In 1215 the fourth Lateran Council, by its 10th canon, ordered suitable men to be in each bishop's cathedral and conventual churches, to act as coadjutors and assistants to the bishops in hearing confessions and imposing penances. The rule was not immediately nor universally obeyed, the bishops being slow to delegate their special powers. Finally, however, the council of Trent (Sess. xxiv. cap. viii. de reform) ordered that, "wherever it could conveniently be done," the bishop should appoint in his cathedral a *poenitentiarius*, who should be a doctor or licentiate in theology or canon law and at least forty years of age.
See P. Hinschius, Kirchenrecht, i. 427, &c. (Berlin, 1869); Du Cange, Glossarium s. v. “Poenitentiarius”; Herzog-Hauck, Realencyklopädie (ed. 1904), s. v. “Poenitentiarius.”

PENKRIDGE, a town in the western parliamentary division of Staffordshire, England; 134 m. N.W. from London by the London & North-Western railway, on the small river Penk. Pop. (1901), 2,437. Trade is chiefly agricultural and there are stone-quarries in the vicinity. The church of St Michael and All Angels, formerly collegiate and dedicated to St Mary, is a fine building principally Perpendicular, but with earlier portions. The Roman Watling Street passes from east to west 3 m. south of Penkridge. In the neighbourhood is Pillaton Hall, retaining a picturesque chapel of the 15th century.

PENLEY, WILLIAM SYDNEY (1822– ), English actor, was born at Broadstairs, and educated in London, where his father had a school. He first made his mark as a comedian by his exceedingly amusing performance as the curate in The Private Secretary, a part in which he succeeded Beerbohm Tree; but he is even more associated with the title role in Brandon Thomas’s Charley’s Aunt (1892), a farce which had an unprecedentedly long run and was acted all over the world.

PENMARCK, a village in western France in the department of Finistère, 15 m. S.W. of Quimper by road. Pop. (1906), of the village, 387; of the commune, 572. On the extremity of the peninsula on which it is situated are fortified remains of a town which was of considerable importance from the 14th to the 16th centuries and included, besides Penmarck, st Guénolé and Kerity. It owed its prosperity to its cod-banks, the disappearance of which together with the discovery of the Newfoundlander cod-banks and the pillage of the place by the bandit La Fontenelle in 1595 contributed to its decadence. The church of St Nouna, a Gothic building of the early 16th century at Penmarck, and the church of St Guénolé, an unfinished tower of the 15th century and the church of Kerity (15th century) are of interest. The coast is very dangerous. On the Point de Penmarck stands the Phare d’Eckmuhl, with a light visible for 60 miles. There are numerous megalithic monuments in the vicinity.

PENN, WILLIAM (1621–1670), British admiral, was the son of Giles Penn, merchant and seaman of Bristol. He served his early years in the navy with his father. In the first Civil War he fought on the side of the parliament, and was in command of a ship in the squadron maintained against the king in the Irish seas. The service was arduous and called for both energy and good seamanship. In 1648 he was arrested and sent to London, but was soon released, and sent back as rear admiral in the “Assurance” (32). The exact cause of the arrest is unknown, but it may be presumed to have been that he was suspected of being in correspondence with the king’s supporters. It is highly probable that he was, for until the Restoration he was regularly in communication with the Royalists, while serving the parliament, or Cromwell, so long as their service was profitable, and making no scruple of applying for grants of the confiscated lands of the king’s Irish friends. The character of “mean fellow” given him by Pepys is borne out by much that is otherwise known of him. But it is no less certain that he was an excellent seaman and a good fighter. After 1650 he was employed in the Channel and in the Mediterranean in pursuit of the Royalist ex-Prince Rupert. He was so active on this service that when he returned home on the 18th of March 1651 he could boast that he had not put foot on shore for more than a year. When the first Dutch War broke out Penn was appointed vice-admiral to Blake, and was present at the battle of the 28th of September off the Keats Knob. In the three days’ battle off Portland, February 1653, he commanded the Blue squadron, and he also served with distinction in the final battles of the war in June and July. In December he was included in the commission of admirals and generals at sea, who exercised the military command of the fleet, as well as “one of the commissioners for ordering and managing the affairs of the admiralty and navy.” In 1654 he offered to carry the fleet over to the king, but in October of the same year he had no scruple in accepting the naval command in the expedition to the West Indies sent out by Cromwell, which conquered Jamaica. He was not responsible for the shameful repulse at San Domingo, which was due to a panic among the troops. On their return he and his military colleague Venables were sent to the Tower. He made humble submission, and when released retired to the estate he had received from confiscated land in Ireland. He continued in communication with the Royalists, and in 1660 had a rather obscure share in the Restoration. He was reappointed commissioner of the navy by the king, and in the second Dutch War served as “great captain commander” or captain of the fleet, with the duke of York (afterwards King James II.) at the battle of Lowestoft (June 3, 1665). When the duke withdrew from the command, Penn’s active service ceased. He continued however to be a commissioner of the navy. His death occurred on the 16th of September 1670, and he was buried in the church of St Mary Redcliffe, Bristol. His portrait by Lely is in the Painted Hall at Greenwich. By his wife Margaret Jasper, he was the father of William Penn, the founder of Pennsylvania. Though the younger Penn was not a high-minded man, he is a figure of considerable importance in British naval history. As admiral and general for the parliament he helped in 1653 to draw up the first code of tactics provided for the navy. It was the base of the “Duke of York’s Sailing and Fighting Instructions,” which continued for long to supply the orthodox tactical creed of the navy.

See the Memorials of the Professional Life and Times of Sir William Penn, by Granville Penn. (D. H.)

PENN, WILLIAM (1644–1718), English Quaker and founder of Pennsylvania, son of Admiral Sir William Penn (1621–1670) and Margaret Jasper, a Dutch lady, was born at Tower Hill, London, on the 14th of October 1644. During his father’s absence at sea he lived at Wanstead in Essex, and went to school at Chigwell close by, in places where he was brought under strong Puritan influences. Like many children of sensitive temperament, he had times of spiritual excitement; when about twelve he was “suddenly surprised with an inward comfort, such as the soul of man was capable of enjoying communication with Him.” Upon the death of Cromwell, Penn’s father, who had served the Protector because there was no other career open, remained with his family on the Irish estates which Cromwell had given him, of the value of £300 a year. On the resignation of Richard Cromwell he at once declared for the king and went to the court in Holland, where he was received into favour and knitted; and at the elections for the convention parliament he was returned for Weymouth. Meanwhile young Penn studied under a private tutor on Tower Hill until, in October 1666, he was entered as a gentleman-commoner at Christ Church. He appears in the same year to have contributed to the Threnodia, a collection of elegies on the death of the young duke of Gloucester.

The rigour with which the Anglican statutes were revived, and the Puritan heads of colleges supplanted, roused the spirit of resistance at Oxford to the uttermost. With this spirit Penn, who was a familiar terms with John Owen (1616–1683), and who had already fallen under the influence of Thomas Le Quaker, then at Oxford, actively sympathized. He and others refused to attend chapel and church service, and were fined in consequence. How far his leaving the university resulted from this cannot be clearly ascertained. Anthony Wood has nothing regarding the cause of his leaving, but says that he stayed at Oxford for two years, and that he was noted for proficiency in manly sports. There is no doubt that in January 1662 his father was anxious to remove him to Cambridge, and consulted Pepys on the subject; and in later years he speaks of being “banished” the college, and of being whipped, beaten and turned out of doors on his return to his father, in the anger of the latter at his avowed Quakerism. A reconciliation, however, was effected; and Penn was sent to France to forget this
folly. The plan was for a time successful. Penn appears to have entered more or less into the gaieties of the court of Louis XIV., and while there to have become acquainted with Robert Spencer, afterwards earl of Sunderland, and with Dorothy, sister to Algernon Sidney. What, however, is more certain is that he somewhat later placed himself under the tuition of Moses Amyraut, the celebrated president of the Protestant college of Saumur, and at that time the exponent of liberal Calvinism, from whom he gained the patristic knowledge which is so prominent in his controversial writings. He afterwards travelled in Italy, returning to England in August 1664, with "a great deal, if not too much, of the vanity of the French garb and affected manner of speech and gait."1

Until the outbreak of the plague Penn was a student of Lincoln's Inn. For a few days also he served on the staff of his father's new great captain-commander—and was by him sent back in April 1665 to Charles with despatches. Returning after the naval victory off Lowestoft in June, Admiral Penn found that his son had again become settled in seriousness and Quakerism. To bring him once more to views of life not inconsistent with court preferment, the admiral sent him in February 1666 with introductions to Ormonde's pure but brilliant court in Ireland, and to manage his estate in Cork round Shannangarry Castle, his title to which was disputed. Penn appears also later in the year to have been "clerk of the cheque" at Kinsale, of the castle and fort of which his father had the command. When the mutiny broke out in Carrickfergus Penn volunteered for service, and acted under Arran so as to gain considerable reputation. The result was that in May 1666 Ormonde offered him his father's company of foot, but, for some unexplained reason, the admiral demurred to this arrangement. It was at this time that the well-known portrait was painted of the great Quaker in a suit of armour; and it was at this time, too, that the conversion, begun when he was a boy by Thomas Loe in Ireland, was completed at the same place by the same agency.2

On the 3rd of September 1667 Penn attended a meeting of Quakers in Cork, at which he assisted to expel a soldier who had disturbed the meeting. He was in consequence, with others present, sent to prison by the magistrates. From prison he wrote to Lord Orrery, the president of Munster, a letter, in which he first publicly makes a claim for perfect freedom of conscience. He was immediately released, and at once returned to his father in London, with the distinctive marks of Quakerism strong upon him. Penn now became a minister of the denomination, and at once entered upon controversy and authorship. His first book, Truth Exalted, was violent and aggressive in the extreme. The same offensive personality is shown in The Whole Missive, a tract written in answer to John Chippam's Guide to the True Religion. It was at this time, too, that he appealed, not unsuccessfully, to Buckingham, who on Clarendon's fall was posing as the protector of the Dissenters, to use his efforts to procure parliamentary toleration.

Penn's first public discussion was with Thomas Vincent, a London Presbyterian minister, who had reflected on the "damnable" doctrines of the Quakers. The discussion, which had turned chiefly upon the doctrine of the Trinity, ended uselessly, and Penn at once published The Sandy Foundation Shaken, a tract of ability sufficient to excite Pepys's astonishment, in which orthodox views were so offensively attacked that Penn was placed in the Tower, where he remained for nearly nine months. The imputations upon his opinions and good citizenship, made as well by Dissenters as by the Church, he repelled in Tolerance, with Her Open Face, in which he asserts his full belief in the divinity of Christ, the atonement, and justification through faith, though insisting on the necessity of good works. It was now, too, that he published the most important of his books, No Cross, No Crown, which contained an able defence of the Quaker doctrines and practices, and a scathing attack on the loose and unchristian lives of the clergy.

While completely refusing to recant Penn addressed a letter to Arlington in July 1669, in which, on grounds of religious freedom, he asked him to interfere. It is noteworthy, as showing the views then predominant, that he was almost at once set at liberty.

An informal reconciliation now took place with his father, who had been impeached through the jealousy of Rupert and Monk (in April 1668), and whose conduct in the operations of 1665 he had publicly vindicated; and Penn was again sent on family business to Ireland. At the desire of his father, whose health was fast failing, Penn returned to London in 1670. Having found the usual place of meeting in Gracechurch Street closed by soldiers. Penn, as a protest, preached to the people in the open street. With William Mead he was at once arrested and indicted at the Old Bailey on the 1st of September for preaching to an unlawful, seditious and riotous assembly, which had met together with force and arms. The Conventicle Act not touching their case, the trial which followed, and which may be read at length in Penn's People's Ancient and Just Liberties Asserted, was a notable one in the history of trial by jury. With extreme courage and skill Penn exposed the illegality of the prosecution, while the jury, for the first time, asserted the right of juries to decide in opposition to the ruling of the court. They brought in a verdict declaring Penn and Mead "guilty of speaking in Gracechurch Street," but refused to add "to an unlawful assembly"; then, as the pressure upon them increased, they first acquitted Mead, while returning their original verdict upon Penn, and then, when that verdict was not admitted, returned their final answer "not guilty" for both. The court fined the jurors 40 marks each for their contumacy, and, in default of payment, imprisoned them, whereupon they vindicated and established for ever the right they had claimed in an action (known as Bushell's case from the name of one of the jurymen) before the court of common pleas, when all twelve judges unanimously declared their imprisonment illegal.

Penn himself had been fined for not removing his hat in court, had been imprisoned on his refusal to pay, and had earnestly requested his family not to pay for him. The fine, however, was settled anonymously, and he was released in time to be present at his father's death on the 10th of September 1670, at the early age of forty-nine. Penn now found himself in possession of a fortune of £1500 a year, and a claim on the Crown for £16,000, lent to Charles II. by his father. Upon his release Penn at once plunged into controversy, challenging a Baptist minister named Jeremiah Ives, at High Wycombe, to a public dispute and, according to the Quaker account, easily defeating him. No account is forthcoming from the other side. Hearing at Oxford that students who attended Prester's meeting were rigorously used, he wrote a vehement and abusive remonstrance to the vice-chancellor in defence of religious freedom. This found still more remarkable expression in the Seasonable Caveat against Popery (Jan. 1671).

In the beginning of 1671 Penn was again arrested for preaching in Wheeler Street meeting-house by Sir J. Robinson, the lieutenant of the Tower, formerly lord mayor, and known as a brutal and bigoted churchman. Legal proof being wanting of any breach of the Conventicle Act, and the Oxford or Five Mile Act also proving inapplicable, Robinson, who had some special cause of enmity against Penn, urged upon him the oath of allegiance. This, of course, the Quaker would not take, and consequently was imprisoned for six months. During this imprisonment Penn wrote several works, the most important being The Great Case of Liberty of Conscience (Feb. 1673), a noble defence of complete toleration. Upon his release he started upon a missionary journey through Holland and Germany; at Emden he founded a Quaker society, and established an intimate friendship with the princess palatine Elizabeth.

Upon his return home in the spring of 1672 Penn married Gulielma Springett, daughter of Mary Pennington by her first husband, Sir William Springett; she appears to have been

1 Pepys, Aug. 30, 1664.
equally remarkable for beauty, devotion to her husband, and firmness to the religious principles which she had adopted when little more than a child.1 He now settled at Rickmansworth in Hertfordshire, and gave himself up to controversial writing. To this year, 1672, belong the Treatise on Oaths and England’s Present Interest Considered. In the year 1673 Penn was still more active. He secured the release of George Fox, addressed the Quakers in Holland and Germany, carried on public controversies with Thomas Hicks, a Baptist, and John Faldo, an Independent, and published his treatise on the Christian Quaker and his Divine TestimonyTyped, the Discourse of the General Rule of Faith and Practice: Reasons against Raising (in answer to Hicks), Counted for Christianity Detected, and a Just Return to Quakerism and the Faith and Practice (in answer to Faldo) and to Quakerism no Christianity. His last public controversy was in 1675 with Richard Baxter, in which, of course, each party claimed the victory.

At this point Penn’s connexion with America begins. The province of New Jersey, comprising the country between the Hudson and Delaware rivers on the east and west, had been granted in March 1663–1664 by Charles II. to his brother; James in turn had in June of the same year leased it to Lord Berkeley and Sir G. Carteret in equal shares. By a deed, dated 18th of March 1673–1674, John Fenwick, a Quaker, bought one of the shares, that of Lord Berkeley (Stoughton erroneously says Carteret’s) in trust for Edward Byllinge, also a Friend, for £400. This deed was registered on 29th January, 1676, and 26th of Dutch War, on the 6th of August 1676. Disputes having arisen between Fenwick and Byllinge, Penn acted as arbitrator; and then, Byllinge being in money difficulties, and being compelled to sell his interest in order to satisfy his creditors, Penn was added, at their request, to two of themselves, as trustee. The disputes were settled by Fenwick receiving ten out of the hundred parts into which the province was divided,2 with a considerable sum of money, the remaining ninety parts being afterwards put up for sale. Fenwick sold his ten parts to two other Friends, Eldridge and Warner, who thus, with Penn and the other two, became masters of West Jersey, West New Jersey, or New West Jersey, as it was indifferently called.3 The five proprietors appointed three commissioners, with instructions dated from London the 6th of August 1676, to settle disputes with Fenwick (who had bought fresh land from the Indians, upon which Salem was built, Penn being himself one of the settlers there) and to purchase new territories, and to build a town—New Beaverly, or Burlington, being the result. For the new colony Penn drew up a constitution, under the title of “Concessions.” The greatest care is taken to make this constitution “as near as may be conveniently to the primitive, ancient and fundamental laws of the nation of England.” But a democratic element is introduced, and the new principle of perfect religious freedom stands in the first place (ch. xvi.). With regard to the liberty of the subject, no one might be condemned in life, liberty or estate, except by a jury of twelve, and the right to challenge was granted to the uttermost (ch. xvii.). Imprisonment for debt was not abolished (as in the states), but was reduced to a minimum (ch. xviii.), whilst theft was punished by twofold restitution either in value or in labour to that amount (ch. xxi.). The provisions of ch. xix. deserve special notice. All causes were to go before three justices, with a jury. “They, the said justices, shall pronounce such judgment as they shall receive from, and be directed by the said twelve men, in whom only the judgment resides, and not otherwise. And in case of their neglect and refusal, that then one of the twelve, by consent of the rest, pronounce their own judgment as the justices should have done.” offences of justice and constables, moreover, were

1 For a very charming account of her, and the whole Pennington connexion, see Maria Webb’s The Penns and Pennings.

2 See on this Stoughton’s Penn, p. 113.

3 The deed by which Penn conveyed the second New Jersey to Penn, Lawry and Nicholas Lucas is dated the 10th of February 1674–1675.

The line of partition was “from the east side of Little Egg Harbour, straight north, through the country, to the utmost branch of Delaware River.”

Penn, William

1 Penn’s letter of the 26th of August 1676 says twelve, and Clarkson has followed this; but the Concessions, which were not assented to by the inhabitants until the 3rd of March 1676–1677, say ten.
PENN, WILLIAM

strenuously objected and even tried to bribe the secretaries, he could not get the name altered. It should be added that early in 1682 Carteret, grandson of the original proprietor, transferred his rights in East Jersey to Penn and eleven associates, who soon afterwards conveyed one-half of their interest to the earl of Perth and eleven others. It is uncertain to what extent Penn retained his interest in West and East Jersey, and when it ceased. The two provinces were united under one governor in 1699, and Penn was a proprietor in 1700. In 1702 the government of New Jersey was surrendered to the Crown.

By the charter for Pennsylvania Penn was made proprietary of the province. He was supreme governor; he had the power of making laws with the advice, assent and approbation of the freemen, of appointing officers, and of granting pardons. The laws were to contain nothing contrary to English law, with a saving to the Crown and the privy council in the case of appeals. Parliament was to be supreme in all questions of trade and commerce; the right to levy taxes was doubtless reserved to England; an agent to represent Penn was to reside in London; neglect on the part of Penn was to lead to the passing of the government to the Crown (which event actually took place in 1692); no correspondence might be carried on with countries at war with Great Britain. The importance of the bishop of London exerted the right to appoint Anglican ministers, should twenty members of the colony desire it, thus securing the very thing which Penn was anxious to avoid—the recognition of the principle of an establishment.

Having appointed Colonel (Sir William) Markham, his cousin, as deputy, and having in October sent out three commissioners to manage his affairs until his arrival, Penn proceeded to draw up proposals to adventurers, with an account of the resources of the colony. He negotiated, too, with James and Lord Baltimore with the view, ultimately successful, of freeing the mouth of the Delaware, wrote to the Indians in conciliatory terms and encouraged the formation of companies to work the infant colony both in England and Germany, especially the “Free Society of Traders in Pennsylvania,” to whom he sold 20,000 acres, absolutely refusing, however, to grant any monopolies. In July he drew up a body of “conditions and concessions.” This constitution, savouring strongly of Harrington’s Ocean, was framed, it is said, in consultation with Sidney, but the statement is doubtful. Until the council of seventy-two (chosen by universal suffrage every three years, twenty-four retiring each year), and the assembly (chosen annually) were duly elected, a body of provisional laws was added.

It was in the midst of this extreme activity that Penn was made a Fellow of the Royal Society. Leaving his family behind him, Penn sailed with a hundred comrades from Deal in the “St. Anne” on the 3rd of September 1682. His Last Farewell to England and his letter to his wife and children contain a beautiful expression of his pious and manly nature. He landed at New Castle on the Delaware on the 27th of October, his company having lost one-third of their number by small-pox during the voyage. After receiving formal possession, and having visited New York, Penn ascended the Delaware to the Swedish settlement of Upland, to which he gave the name of Chester. The assembly at once met, and on the 7th of December passed the “Great Law of Pennsylvania.” The idea which informs this law is that Pennsylvania was to be a Christian state on a Quaker model. Philadelphia was now founded, and within two years contained 300 houses and a population of 2500. At the same time an act was passed, uniting under the same government the territories which had been granted by feu-fmitt by James in 1682. Realistic and entirely imaginary accounts (cf. Dixon, p. 270), inspired chiefly by Benjamin West’s picture, have been given of the treaty which there seems no doubt Penn actually made in November 1683 with the Indians. His connexion with them was one of the most successful parts of his management, and he gained at once and retained through life their intense affection.

Penn now wrote an account of Pennsylvania from his own observation for the “Free Society of Traders,” in which he shows considerable power of artistic description. Tales of violent persecution of the Quakers, and the necessity of settling disputes, which had arisen with Lord Baltimore, his neighbour in Maryland, brought Penn back to England (Oct. 2, 1684) after an absence of two years. In the spring of 1683 he had modified the original charter at the desire of the assembly, but without at all altering its democratic character. He was, in reference to this alteration, charged with selfish and deceitful dealing by the assembly. Within five months after his arrival in England Charles II. died, and Penn found himself at once in a position of great influence. Penn now took up his abode at Kensington in Holland House, so as to be near the court. His influence there was great enough to secure the pardon of John Locke, who had been dismissed from Oxford by Charles, and of 1200 Quakers who were in prison. At this time, too, he was busy with his pen once more, writing a further account of Pennsylvania, a pamphlet in defence of Buckingham’s essay in favour of toleration, in which he is supposed to have had some share, and his Persuasive to Moderation to Dissenting Christians, very similar in tone to the One Project for the Good of England. When Monmouth’s rebellion was suppressed he appears to have done his best to mitigate the horrors of the western commission, opposing Jeffrey’s to the uttermost. Macaulay has accused Penn of being concerned in some of the worst actions of the court at this time. His complete reformation by Forster, Paget, Dixon and others renders it unnecessary to do more than allude to the cases of the Maids of Taunton, Alderman Kiffin, and Magdalen College (Oxford).

In 1686, when making a third missionary journey to Holland and Germany, Penn was charged by James with an informal mission to the prince of Orange to endeavour to gain his assent to the removal of religious tests. Here he met Burnet, from whom, as from the prince, he gained no satisfaction, and who greatly disliked him. On his return he went on a preaching mission through England. His position with James was undoubtedly a compromising one, and it is not strange that, wishing to tolerate Papists, he should, in the prevailing temper of England, be once more accused of being a Jesuit, while he was in constant antagonism to their body. Even Tillotson took up this view strongly, though he at once accepted Penn’s vehement disavowal. In 1687 James published the Declaration of Indulgence, and Penn probably drew up the address of thanks on the part of the Quakers. It fully reflects his views, which are further ably put in the pamphlet Good Advice to the Church of England, Roman Catholics, and Protestant Dissenters, in which he showed the wisdom and duty of repealing the Test Acts and Penal Laws. At the Revolution he behaved with courage. He was one of the few friends of the king who remained in London, and, when twice summoned before the council, spoke boldly in his behalf. He admitted that James had asked him to come to him in France; but at the same time he asserted his perfect loyalty. During the absence of William in 1690 he was proclaimed by Mary as a dangerous person, but no evidence of treason was forthcoming. It was now that he lost by death two of his dearest friends, Robert Barclay and George Fox. It was at the funeral of the latter that, upon the information of the notorious informer William Fuller (1670-1717?), an attempt was made to arrest him, but he had not left the ground; the fact that no further steps were then taken shows how little the government believed in his guilt. He now lived in retirement in London, though his address was perfectly well known to his friends in the council. In 1691, again on Fuller’s evidence, a proclamation was issued for the arrest of Penn and two others as being concerned in Preston’s plot. In 1692 he began to write again, both on questions of Quaker discipline and in defence of the sect. Just Measures in an Epistle of Peace and Love, The New Atheans (in reply to the attacks of the Athenian Mercury), and A Key Opening the Way to every Capacity are the principal publications of this year.

Meantime matters had been going badly in Pennsylvania.

1 Dixon, p. 276.

Penn, William

Penn had, in 1686, been obliged to make changes in the composition of the executive body, though in 1689 it reverted to the original constitution; the legislative bodies had quarrelled; and Penn could not gain his rents. The chief difficulty in Pennsylvania was the dispute between the province—i.e. the country given to Penn by the charter—and the “territories,” or the lands granted to him by the duke of York by foemint in August 1682, which were under the same government but had differing interests. The difficulties which Quaker principles placed in the way of arming the colony—a matter of grave importance in the existing European complications—fought most hardly against Penn's power. On the 21st of October 1692 an order of council was issued depriving Penn of the governorship of Pennsylvania and giving it to Colonel Benjamin Fletcher, the governor of New York. To this blow were added the illness of his wife and a fresh accusation of reasonable correspondence with James. In his enforced retirement he wrote the most devotional and most charming of his works—the collection of maxims of conduct and religion entitled The Fruits of Solitude. In December, thanks to the efforts of his friends at court, among whom were Buckingham, Somers, Rockingham, and Wharton, and the influence of which was already felt, he received an intimation that no further steps would be taken against him. The accusation, however, had been public, and he insisted on the withdrawal being equally public. He was therefore heard in full council before the king, and honourably acquitted of all charges of treason. It was now that he wrote an Essay towards the Present and Future Peace of Europe, in which he puts forth the idea of a great court of arbitration, a principle which he had already carried out in Pennsylvania.

In 1694 (Feb. 23) his wife Gulielma died, leaving two sons, Springett and William, and a daughter Letitia, afterwards married to William Aubrey. Two other daughters, Mary and Hannah, died in infancy. He conspired himself by writing his Account of the Rise and Progress of the People called Quakers. The coldness and suspicion with which he had been regarded by his own denomination had now ceased, and he was once more regarded by the Quaker body as their leader. About the same time (Aug. 26) he was restored to the governorship of Pennsylvania; and he promised to supply money and men for the defence of the frontier. In 1695 he went on a second preaching mission in the west, and in March 1696 he formed a second marriage, with Hannah Callowhill, his son Springett dying five weeks later. In this year he wrote his work On Primitive Christianity, in which he argues that the faith and practice of the Friends were those of the early Church. In 1697 Penn removed to Bristol, and during the greater part of 1698 was preaching with great success against oppression in Ireland, whither he had gone to look after the property at Shannangarry.

In 1699 he was back in Pennsylvania, landing near Chester on the 30th of November, where the success of Colonel Robert Quay, judge of the admiralty in Pennsylvania—who was in the interests of those who wished to make the province an imperial colony—and the high-handed action of the deputy Markham in opposition to the Crown, were causing great difficulties. Penn carried with him particular instructions to put down piracy, which the objections of the Quakers to the use of force had rendered audacious and concerning which Quay had made strong representations to the home government, while Markham and the inhabitants apparently encouraged it. Penn, however, came at once to a satisfactory understanding on this matter, and the illegal traffic was vigorously and successfully attacked. In 1696 the Philadelphian Yearly Meeting had passed a resolution declaring slavery contrary to the first principles of the gospel. Penn, however, did not venture upon emancipation; but he insisted on the instruction of negroes, permission for them to marry, repression of polygamy and adultery, and proposed regulations for their trial and punishment. The assembly, however, a very mixed body of all nations, now refused to accept any of these proposals except the last-named. His great success was with the Indians; by their treaty with him in 1700 they promised not to help any enemy of England, to traffic only with those approved by the governor, and to sell furs or skins to none but inhabitants of the province. At the same time he showed his capacity for legislation by the share he took with Lord Bellomont at New York in the consolidation of the laws in use in the various parts of America.

Affairs now again demanded his presence in England. The king had in 1701 written to urge upon the Pennsylvania government a union with other private colonies for defence, and had asked for money for fortifications. The diffictly felt by the Crown in this matter was a natural one. A bill was brought into the lords to convert private into Crown colonies. Penn's son appeared before the committee of the house and managed to delay the matter until his father's return. On the 15th of September Penn called the assembly together, in which the differences between the province and the territories again broke out. He succeeded, however, in calming them, appointed a council of ten to manage the province in his absence, and gave a borough charter to Philadelphia. In May 1700, experience having shown that alterations in the charter were advisable, the assembly had, almost unanimously, requested Penn to revise it. On the 28th of October 1701 he handed it back to them in the form in which it afterwards had to be re-adopted. The assembly was to be chosen yearly, of four persons from each county, with all the self-governing privileges of the English House of Commons. Two-thirds were to form a quorum. The nomination of sheriffs, coroners, and magistrates for each county was given to the governor, who was to select from names handed in by the freemen. Moreover, the council was no longer elected by the people, but nominated by the governor, who was thus practically left single in the executive. The assembly, however, who, by the first charter, had not the right to propound laws, but might only amend or reject them, now acquired that privilege. In other respects the original charter remained, and the inviolability of conscience was again emphatically asserted. Penn reached England in December 1701. He once more assumed the position of leader of the Dissenters and himself read the address of thanks for the promise from the Throne to maintain the Act of Toleration. He now took up his abode again at Kensington, and published while here his More Fruits of Solitude.

In 1703 he went to Knightsbridge, where he remained until 1706, when he removed to Brentford, his final residence being taken up in 1710 at Field Ruscombe, near Twyford. In 1704 he wrote his Life of Bulstrode Whitelocke. He had now much trouble from America. The territorialists were openly rejecting his authority, and doing their best to obstruct all business in the assembly; and matters were further embittered by the injudicious conduct of Governor John Evans in 1706. Moreover, pecuniary troubles came heavily upon him, while the conduct of his son William, who became the ringleader of all the dissolute characters in Philadelphia, was another and still more severe trial. This son was married, and had a son and daughter, but appears to have been left entirely out of account in the settlement of Penn's proprietary rights on his death.

Whatever were Penn's great qualities, he was deficient in judgment of character. This was especially shown in the choice of his steward Ford, from whom he had borrowed money, and who, by dexterous swindling, had managed, at the time of his death, to establish, and hand down to his widow and son, a debt of £14,000 against Penn. Penn, however, refused to pay and spent nine months in the Fleet rather than give way. He was released at length by his friends, who paid £7500 in composition of all claims. Difficulties with his government of Pennsylvania continued to harass him. Fresh disputes took place with Lord Baltimore, the owner of Maryland, and Penn also felt deeply what seemed to him the ungrateful treatment which he met with at the hands of the asser aly. He therefore in 1710 wrote, in earnest and affectionate language, an address to his "old friends," setting forth his wrongs. So great was the effect which this produced that the assembly which met in October of that year was entirely in his interests; revenues were properly paid; the disaffected were silenced and complaints
were hushed; while an advance in moral sense was shown by the fact that a bill was passed prohibiting the importation of negroes. This, however, when submitted to the British parliament, was cancelled. Penn now, in February 1712, being in failing health, proposed to surrender his powers to the Crown. The commission of plantations recommended that Penn should receive £12,000 in four years from the time of surrender, Penn stipulating only that the queen should take the Quakers under her protection; and £100 was given him in part payment. Before, however, the matter could go further he was seized with apoplectic fits, which shattered his understanding and memory. A second attack occurred in 1713. He died on the 30th of May 1718, leaving three sons by his second wife, John, Thomas and Richard, and was buried along with his first and second wives at Jourdain's meeting-house, near Challont St Giles in Buckinghamshire. In 1790 the proprietary rights of Penn's descendants were bought up for a pension of £400 a year to the eldest male descendant by his second wife, and this pension was commuted in 1884 for the sum of £67,000.

Penn's Life was written by Joseph Besse, prefixed to the collected works (1778), see also the bibliographical note to the article in Dict. Nat. Bio. W. Hepworth Dixon's biography, refuting Macaulay's charges, appeared in 1851. In 1907 Mrs Colquhoun Grant, one of Penn's descendants, brought out a book, Quaker and Courtesey: The Life and Work of William Penn (O. A.)

PENNANT, THOMAS (1726–1798), British naturalist and antiquary, was descended from an old Welsh family, for many generations resident at Downing, Flintshire, where he was born on the 14th of June 1726. He received his early education at Wrexham, and afterwards entered Queen's College, Oxford, but did not take a degree. At twelve years of age he was inspired with a passion for natural history through being presented with Francis Willughby's Ornithology; and a tour in Cornwall in 1746–1747 awakened his strong interest in minerals and fossils. In 1750 his account of an earthquake at Downing was inserted in the Philosophical Transactions, where there also appeared in 1756 a paper on several coralline bodies he had collected at Coalbrookdale, Shropshire. In the following year, at the instance of Linnaeus, he was elected a member of the Royal Society of Upsala. In 1756 he published the first part of his British Zoology, a work meritorious rather as a laboursome compilation than as an original contribution to science. During its progress he visited the continent of Europe and made the acquaintance of Buffon, Voltaire, Haller and Pallas. In 1767 he was elected F.R.S. In 1771 was published his Synopsis of Quadrupeds, afterwards extended into a History of Quadrupeds. At the end of the same year he published A Tour in Scotland in 1769, which proving remarkably popular was followed in 1774 by an account of another journey in Scotland, in two volumes. These works have proved invaluable as preserving the record of important antiquarian relics which have now perished. In 1778 he brought out a similar Tour in Wales, which was followed by a Journey to Snowdon (pt. i. 1781; pt. ii. 1783), afterwards forming the second volume of the Tour. In 1782 he published a Journey from Chester to London. He brought out Arctic Zoology in 1785–1787. In 1790 appeared his Account of London, which went through a large number of editions, and three years later he published this Life of William Penn, written by himself. In his later years he was engaged on a work entitled Outlines of the Globe, vols. i. and ii. of which appeared in 1798, and vols. iii. and iv., edited by his son David Pennant, in 1800. He was also the author of a number of minor works, some of which were published posthumously. He died at Downing on the 16th of December 1798.

PENNANOR, or PENNER, two rivers of southern India, distinguished as North and South. The native name is Pinakini. Both rise near the hill of Sondrung in Mysore state, and flow eastward into the Bay of Bengal. The northern is the more important and has a total length of 355 m., that of the southern being 245 m. This latter bears the alternative name of the Pinanor. The Pennanor (northern) river canal system comprises more than 30 m. of canals, irrigating 155,500 acres.

PENNE, a town and episcopal see of Italy, in the province of Teramo, 26 m. S.E. of Teramo, and 16 m. inland from the Adriatic, 1,424 ft. above sea-level. Pop. (1901) 7,500. The cathedral has been much altered; in its treasury is some fine 13th (?) century silversmiths' work; the church of S. Giovanni has a fine cross by Nicola di Guardiagrele, and that of S. Maria in Colleromano, outside the town, a Romanesque portal. Many of the houses have fine terra-cotta friezes. It occupies the site of the ancient Pinna, the chief city of the Vestini, who entered into alliance with Rome in 301 B.C. and remained faithful to her through the Hannibalic wars and even during the revolt of the Italian allies in 90 B.C. No remains of the Roman period exist, even the city walls being entirely medieval.

See G. Colasanti, Pinna (Rome, 1907); V. Bindi, Monumenti degli Abruzzi (Naples, 1889, pp. 565 sqq.).

PENNELL, JOSEPH (1860– ), American artist and author, was born in Philadelphia on the 4th of July 1860, and first studied there, but like his compatriot and friend, J. M. Whistler, he afterwards went to Europe and made his home in London. He produced numerous books (many of them in collaboration with his wife, Elizabeth Robins Pennell), but his chief distinction is that he was one of the original members of the literary group of the Euston Road, and an illustrator. Their close acquaintance with Whistler led to Mr and Mrs Pennell undertaking a biography of that artist in 1906, and, after some litigation with his executrix on the right to use his letters, the book was published in 1928.

PENNI, GIANFRANCESCO (1488–1528), Italian painter, surnamed "II Fattore," from the relation in which he stood to Raphae[1], whose favourite disciple he was after Giulio Romano, was a native of Florence, but spent the latter years of his life in Naples. He painted in oil as well as in fresco, but is chiefly known for his work in the Loggie of the Vatican.

PENNINE CHAIN, an extensive system of hills in the north of England. The name is probably derived from the Celtic pen, high, appearing in the Annals of Ireland and the Pennine Alps. The English system is comprised within the following physical boundaries. On the N. a well-marked depression, falling below 500 ft. in height, between the upper valleys of the Irthing and the south Tyne, from which it is known as the Tyne Gap, separates the Pennines from the system of the Cheviots. On the N.E., in Northumberland, the foothills extend to the North Sea. On the N.W. the Eden valley forms part of the boundary between the Pennines and the hills of the Lake District, and the division is continued by the upper valley of the Lune. For the rest the physical boundaries consist of extensive lowlands—on the E. the vale of York, on the W. the coastal belt of Lancashire and the plain of Cheshire, and on the S. and S.E. the valley of the river Trent. The Pennines thus cover parts of Cumberland, Westmorland and Northumberland, Lancashire and Yorkshire, Cheshire and Derbyshire, while the southern foothills extend into Staffordshire and Nottinghamshire.

The Pennine system is hardly a range, but the hills are in effect broken up into numerous short ranges by valleys cut back into them in every direction, for the Pennines form a north and south watershed which determines the course of all the larger rivers in the north of England. The chain is divided into two sections by a gap formed by the river Aire flowing east, a member of the Humber basin, and the Ribble flowing west and entering the Irish Sea through a wide estuary south of Morecamne Bay.

The northern section of the Pennine system is broader and generally higher than the southern. Its western slope is generally short and steep, the eastern long and gradual; this disposition applies to the Pennine system in the north-west a sharp escarpment overlooks the Eden valley. This is the nearest approach to a true mountain range in the Pennine system and indeed in England. It is known as the Cross Fell Edge from its highest point, Cross Fell (2452 ft.), some 25 m. to the south-west of Cross Fell, 2580 ft. is reached in Milburn Forest, and of 2591 ft. in Mickler Fell. This range is marked off eastward by the upper valleys of the south Tyne and the Tees, and, from the divide between these two, branch ranges spring eastward, separated by the valley of the Wear, at the head of which are Burnhope Seat (2452 ft.) and Dead Stones (2326 ft.). In the northern range the highest point is Middlehope Moor (2206 ft.), and in the southern, Chapel Fell Top (2394 ft.). It is thus seen that the...
higher elevations, like the steeper slopes, lie towards the west. Cross Fell Edge terminates southward at a high pass (about 1400 ft.) between the head of the Belah, a tributary of the Eden, and the Greta, a tributary of the Tees. This pass is followed by the Tees and Wharfe Valleys, bounded by the east-west running North Eastern railway line of the Lune valley on the west and the headstream of the Eden and the Ribble on the east are broken into masses by the dales of tributaries to the first-named river—here the chief elevations are Wild Boar Fell (2523 ft.), Whernside (2414 ft.), and Ingleborough (2958 ft.). Between wild streams and the Vale of Mow Cop-tops beyond 2500 ft. are not uncommon. The line of this railway is well-marked eastward ranges occur between Swaledale and the river Ure, which traverses the celebrated Wensleydale (q.v.), and between the Ure and Wharfe. The Great Wharfe (q.v.) forms the boundary between the Adel and Shunner Fell (2340 ft.); and in the second Buckden Pike (250 ft.) and Great Whernside (2310 ft.). There is then a general southerly slope to the Aire gap.

The drainage of the system calls for less detailed notice. The profile of the Pennines thus follows a gently rising rule, but much fine scenery is found in the narrow dales throughout; Wensleydale, Wharfedale and other Yorkshire dales being no less famous than the dales of Derbyshire. In the parts about Settle below Ingleborough, one of the highest peaks of the range, and especially on the subterranean watercourses in the limestone have been explored to great depths. In Ingleborough itself are the Ingleborough Cave, near Clapham; the chasm of Gaping Ghyll, over 350 ft. deep; Helm or Hell Hole, &c. In the Swindale, Helm Crag (406 ft.) and other Pennine dales there are long caverns, in some of which the water runs at a temperature of 55°. A notable example in Derbyshire is the disappearance of the Wye into Plunge Hole, after which it traverses Poole’s Cave, close to Buxton. There may also be noted the remarkable series of caverns near Castleton (q.v.) (Lancashire) where the low and small in the Peak district, but in some of the upland valleys, such as those of the Nidd and the Etherow, reservoirs have been formed for the supply of the populous manufacturing districts of Lancashire and the West Riding of Yorkshire, which lie on either flank of the system between the Aire gap and the Humber. (For geology see England and articles on the several counties.)

**Pennsylvania**, a North Atlantic state of the United States of America and one of the original thirteen, lying for the most part between latitudes 39° 43‘ 26‘ 3‘ and 42° N. and between latitudes 74° 40‘ and 80° 31‘ 36‘ W. The state is in the form of a triangle, except in the north-west where a triangular projection, extending to 42° 15‘ N. lat., gives it a shoreline of nearly 400 m. on Lake Erie, on the east where the Delaware river with two large bays separates it from New York and New Jersey, and in the south-east where the arc of a circle which was described with a 12-m. radius from New Castle, Delaware, forms the boundary between it and Delaware. The foot of the plains and part of the latitude forms the boundary between it and New York on the N.; Mason and Dixon’s line is the border between it and Maryland and West Virginia on the south and a north and south line marks the boundary between it and West Virginia and Ohio on the west. The total area is 45,126 sq. m. and of this 294 sq. m. are water surface.

**Physical Features.**—Pennsylvania skirts the coastal plain in the south-east below Philadelphia, is traversed from north-east to south-west by the three divisions of the Appalachian province—Pennsylvania Highlands, Allegheny Plateau, and Appalachian Plateau—and in the north-west corner is a small part of the Erie plain. The entire state has a mean elevation of about 1100 ft. above the sea. It rises from 20 ft. or less on the bank of the Delaware between Philadelphia and Chester to 2000–2000 ft. on the higher ridges in the middle section (3136 ft. on Blue Knob in Bedford county), and falls again to 900–1000 ft. on the Ohio border and to 250 ft. or less on the Erie plain; in the south-east is an area of about 6100 sq. m. that is less than 300 ft. above the level of the sea. The range of elevation in the state is 14000 ft. above sea-level in the Alleghanies to 60 ft. at the coast, and the aggregate area of about 2000 sq. m. that everywhere exceeds 2000 ft. in elevation. The area below 500 ft. is mostly in the Triassic lowland of the Piedmont region, or, as the Pennsylvania portion is called, the central plain. The Piedmont is a dissecting plain which has been produced by the wearing away of weak sandstones, &c. On the north and west borders of this plain are two parts of a chain of semi-detached and usually rounded hills, known as the South Mountains. The north-east part is a south-westward arm of the New England uplands, is known as the Reading Prong, and extends from New Jersey through Easton to Reading. The south-west part is a north-eastern prolongation of the Virginia Piedmont, is known as the Cumberland Prong, and extends N.N.E. through the south part of Cumberland county. In the Reading Prong most of the hills rise 900–1000 ft. above the sea and in the Cumberland Prong their height increases to the southward until, on the Maryland border, they rise 2100 ft. above the sea and 1400 ft. above the adjoining plain. Another range of hills, known as the Trenton Prong, extends from the northern suburbs of Philadelphia, passing into New Jersey, and extending southward to the Delaware, Lancaster and York counties, but these rise only 400–600 ft. above the sea and have few steep slopes. Both of these ranges of hills are composed of hard crystalline rocks, and between them are the broad lowlands of the Delaware, Schuylkill, and Lehigh rivers. In Bucks and Montgomery counties is a large sandstone area; traversing Chester county is the narrow Valley with a limestone bottom, and in Lancaster county is the most extensive area of the series of Mountain ridges formed by the Alleghany ranges, which are crossed by the Susquehanna river. The Berkshire Mountains, or Great Western Ridge, which forms a distinct division of the central province and lies between the South Mountains and the long range of Alleghany Mountains, is about 10 m. in width on the Maryland border and to the south-east is reduced to a more or less narrow strip, but the south-east part of this range is a gently rolling part of the Alleghany province, which is a small part of it is a slate belt that has been much dissected by eroding streams, but the south-east part of the Alleghany province is a gently rolling area formed by broad ridges, which are dissected by broad valleys, and except by shallow valleys and occasional knobs. The Alleghany plateau, which extends from the crest of the Alleghany Front to and beyond the west and north borders of Pennsylvania, covers more than one-half of the state, is much more dissected than the Alleghany province; in Tioga and Potter counties on the north middle border, it rises 2400–2500 ft. above the sea, but from this height the general upland level falls gradually to 1200–1300 ft. in the south-west and 900–1000 ft. along the Ohio border and in Erie county. There is a sudden fall of about 200 ft. to the Erie plain. In the northern, middle and south-west portions of this plateau province the upland is cut by an intricate network of narrow valleys and ravines that are cut into the Alleghany plateau, but the upland is deeper, and the extreme western portion of the south-east province are drained by tributaries of the Potomac; the Erie plain is drained by short streams into Lake Erie; and a very small section of the south-east province, in the northern part of Potter county, is drained by the Genesee river into Lake Ontario. The Susquehanna drains about 21,000 sq. m. of the state; the Ohio, Allegheny and Monongahela
PENNSYLVANIA

14,747 sq. m.; and the Delaware 6433 sq. m. The Susquehanna is a wide and shallow stream with a zigzag course and numerous islands, but both the Susquehanna and the Delaware, together with their principal tributaries, flow for the most part transverse to the geological structure, and in the gorges and water-gaps through which they pass, display a most picturesque scenery in the state; a number of these gorges, too, have been of great economic importance as passages for railways. The lower portion of the Delaware river has been entered by the sea to form the Delaware Bay. Dredging has removed the mud from the head of which developed the city of Philadelphia. The present course of the Upper Allegheny river is the result of the glacier which blocked the northward drainage of the region through which it flows, and the Allegheny, in its valley, the winter mean is 30°, the summer mean 71°, and the temperature in summer (June, July and August) is 74°, and the range of extremes here for a long period of years ending with 1907 was within 103° and 6°. At Huntington, Huntington county, in the southwestern part of the state, the temperature is 29° in winter and 68° in summer. The temperature on record for 1907 extremes ranged from 104° to 23°. The summer maxima on the mountains are usually 8° to 10° less than in the valleys directly below them; Sagerstown, state number 1907, in 1907 had a mean winter temperature of 5° and a mean summer temperature of 71°; yet the winter mean is 28° at Erie and only 25° at Sagerstown, and the lowest temperature on record for Erie is —16° while for Sagerstown it is —27°. During the period from 1875 to 1905 there was a gradual increase in temperature, and in 1907 the mean temperatures for the winters were 3° in the north and 5° in the south, and for the summers 92° in the north and 77° in the south. The prevailing winds are westerly, but they are frequently interrupted by warm breezes from the south, or moisture-bearing currents from the east.

Fauna.—Under the protection of a game commission which was created in 1895, of some game preserves which have been established in wilder sections, and the number of game and birds, the numbers of Virginia deer, black bear, rabbits, ruffed grouse, quail and wild turkeys have increased until in some of the wilder sections they are quite plentiful, while the numbers of birds of prey, such as hawks, owls, and buzzards, have increased greatly. There are many species of ducks and a few Canada geese. The song and insectivorous birds—thrushes, flycatchers, vireos and woodpeckers—of this latitude, are well represented, and the high plateaus (particularly the Pocono plateau) have especial ornithological interest as the home of the white-throated sparrow, the northern flicker, the red-breasted nuthatch, the pine siskin, the brown thrasher, the fox sparrow, the Canada jay, the red-headed woodpecker, the Bewick's wren, the downy woodpecker, the chestnut-backed chickadee, the American robins, the rose-breasted grosbeak, the Canada jay, the American robin, the scarlet tanager, the wild turkeys, and the white-throated sparrow, are peculiar to this latitude. The white-throated sparrow, which has increased rapidly under protection, has been considered as one of the most valuable as a scavenger.) is seen occasionally, especially in the south and south-west. The game birds include the ruffed grouse, quail, and English pheasant (which have increased rapidly under protection), besides turkeys, snipe, woodcocks and skunks are common, and musk-rats, porcupines and opossums are found in some sections. Two species of venomous snakes—the rattlesnake and the copper-head—occur in the sparsely settled sections. Other birds which are characteristic of this latitude are the gray kingfisher, the pygmy woodpecker, the yellow-bellied sapsucker, the great horned owl, the barn owl and the screech owl; and bald eagles are not uncommon in the mountainous regions along the larger streams. The Allegheny barrows, a pelican-like water fowl, are found in some sections along the south-east border of the mountain district or farther south-east where the rains are occasionally heavy, and it is less than 40° in some of the north-east and south-west counties. The amount of rainfall during the summer is about 3 in. more than during the winter, and in the warmer months the temperature is 21° to 22° during spring. In the mountain region and in the vicinity of Lake Erie there is often a fall of several inches of snow during the winter months and the rapid melting of this produces floods on the Delaware. The Susquehanna, although its waters are not navigable as a river, is a valuable as a water-way, and the prevailing winds are westerly, but they are frequently interrupted by warm breezes from the south, or moisture-bearing currents from the east.

Flora.—The most productive soil is that in the south-east section of the Great Valley and in Chester Valley where it is derived largely from limestone. There is some of the same formation as well as that derived from red shales on the sandstone hills in the south-eastern counties. There are also many sections of low, flat land, and in the valley of the Susquehanna below Harrisburg, and on Presque Isle are some plants peculiar to the Lake region. The state has forest reserves (918,000 acres in 1910) in 26 counties, the largest areas being in Potter, Clinton, Centre, Union, and Clearfield counties. The state has an efficient department of forestry under a state commissioner of forestry. A state forest academy (the only one in the United States) is at Mont Alto, where there are one of the three state nurseries; its first graduates received an act authorizing any city, county, or city and there is an efficient department of forestry under a state commissioner of forestry. A state forest academy (the only one in the United States) is at Mont Alto, where there are one of the three state nurseries; its first graduates received an act authorizing any city, county, or city

Climate.—The temperature is quite mild and equable in the south-eastern counties where the ocean influences it and where the mountains bordering it on the north and west-west are subject to excessive heat in summer and severe cold in winter. The mean annual temperature decreases to near the north-westward on the Allegheny plateau, but on the Erie plain, in the extreme north-west, Lake Erie exerts its moderating influence, the mean temperature rises, and extremes shorten. The mean temperature in the north-east counties is 3° less than in the south-east counties, in the north-west counties it decreases to 5° in the central province and to 47° or less in some of the states adjoining Lake Erie, but rises to 55° on the shore of Lake Erie. At Philadelphia the mean temperature is 53° in winter and 71° in summer, and the temperature in June (July and August) is 74°, and the range of extremes here for a long period of years ending with 1907 was within 103° and 6°. At Huntington, Huntington county, in the southwestern part of the state, the temperature is 29° in winter and 68° in summer. The temperature on record for 1907 extremes ranged from 104° to 23°. The state has forest reserves (918,000 acres in 1910) in 26 counties, the largest areas being in Potter, Clinton, Centre, Union, and Clearfield counties. The state has an efficient department of forestry under a state commissioner of forestry. A state forest academy (the only one in the United States) is at Mont Alto, where there are one of the three state nurseries; its first graduates received an act authorizing any city, county, or city
from 350,398 in 1850 to 619,000 in 1910. The number of mules increased steadily from 2,259 in 1850 to 43,000 in 1910. The raising of sheep and swine was of considerably less relative importance in 1910 than in 1850, there being 1,882,357 sheep and 1,040,266 swine in 1850, as compared with 2,013,743 sheep and 1,223,012 swine in 1910. The dairy business is largest in the regions around Philadelphia and Pittsburgh, and in Erie and Bradford counties. Cattle other than dairy cows, as well as horses and sheep are most numerous in the western counties, consisting of the greatest portion of the counties of the south-east. Swine are most numerous in the south-east and south-west counties. The state ranks high in the production of potatoes, cabbages, lettuce and turnips, and it is a large producer of onions, tomatoes, and other vegetables valued by their fiber content. Muskmelons and asparagus produce is also of importance.

The total value of all vegetables produced in 1899 was $15,832,904, an amount exceeding that of any other state except New York. A large portion of the vegetables are grown in the counties of the south-east and south-west, and the principal products include: a great variety of vegetables; summer and winter greens; and a large variety of garden and field vegetables. The total value of the vegetables produced in 1899 was $1,940,922, and the total value of the vegetables produced in 1898 was $1,763,906.

In 1899, 1,376,000 tons of coal were produced, and in 1872, 2,379,914 tons. In 1899, 1,376,000 tons of coal were produced, and in 1872, 2,379,914 tons. In 1872, 2,379,914 tons of coal were produced, and in 1899, 1,376,000 tons of coal were produced. The total value of the coal produced in 1899 was $19,929,000, and the total value of the coal produced in 1898 was $19,400,000.

The production of coal in 1899 was 1,376,000 tons, and in 1872, 2,379,914 tons. In 1872, 2,379,914 tons of coal were produced, and in 1899, 1,376,000 tons of coal were produced. especially in Philadelphia, for the erection of the so-called brown stone fronts. On the Pocono plateau is a large deposit of a fine-grained dark blue stone of the Devonian formation which is known as the Wyoming Valley stone, and like the New York "bluestone," it has been much used in building. It contains an extensive area in the south-east part of the state containing shale clay of a superior quality for making common brick. Kaolin abounds in Chester and Delaware counties, and fire-clay in several counties, and there is some garnet in Delaware county.

Manufactures.—The state ranks second to New York in the value of its manufactures, which increased from $155,044,910 in 1850 to $1,869,653,174 in 1905. The strongest industry is that of the manufacture of iron and steel, which is one of the most productive deposits of coal, second in importance only to those of Maine. Soapstone is quarried in Montgomery and Northampton counties, phosphate rock, in Juniata county; salt, in the counties of Berks and Montgomery, in several counties, and there is some garnet in Delaware county.

the end of 1808, when it was exceeded by only two states in the Union, Texas and Illinois. The principal railways are the lines operated by the Pennsylvania Railroad Company from New York to Washington through Philadelphia; from Philadelphia to Cincinnati, and from the Great Lakes to Pittsburg; from Baltimore, Maryland, to Sudus Point on Lake Ontario (Northern Central) through Harrisburg and Williamsport; from Williamsport to Buffalo and to Erie, and from Pittsburg to Buffalo. The Delaware, Lackawanna & Western; the Baltimore & Ohio; and the Buffalo, Rochester & Pittsburg. The state has one port entry point along the Atlantic coast, one in the Ohio River, and one in the Lake Michigan ports. The Atlantic port, exports chiefly petroleum, coal, grain, and flour, and imports chiefly iron ore, sugar, drugs, and chemicals, manufactured iron, hemp, jute, and flax. In 1909 the value of its exports was 80,901,400, of which 49,049,000 were to other American countries and 31,852,400 to New York, and the value of its imports was 78,000,464, was greater than of any except New York and Boston. Pittsburgh ranks high among the interior ports in the country and first among the cities of the United States in the tonnage of its domestic commerce. Erie is quite unimportant among the lake ports in foreign commerce, but has a large domestic trade in iron ore, copper, wheat and flour. 

Population.—The population of Pennsylvania was 434,373 in 1790; 520,365 in 1800; 810,061 in 1810; 1,040,458 in 1820; 1,435,833 in 1830; 1,724,035 in 1840; 2,116,768 in 1850; 2,906,215 in 1860; 3,257,051 in 1870; 4,283,281 in 1880; 5,218,014 in 1890; 6,302,151 in 1900; 7,655,111 in 1910. Of the total in 1880, 985,406 were men, and 1,257,815 women. Of those foreign born, 2,977,022, or 39.0 per cent., were from Austria, 2,977,022, or 39.0 per cent., were from England, and 2,977,022, or 39.0 per cent., were from Germany. Of the 1870, there were Chinese and were Japanese. Nearly 93 per cent. of the foreign-born was composed of natives of Germany (21,453), Ireland (2,050), Great Britain (180,670), Poland (76,538), Austria (67,492), Italy (66,953), Russia (50,009), Hungary (47,303), and Sweden (24,130). Of the native population (5,316,865) 90.7 per cent. were born within the state and a little more than two-fifths of the remainder were natives of New York, Maryland, Ohio, New Jersey, Virginia, New England, Delaware and West Virginia. Almost two-thirds of the Indians were in Cumberland county where, at Carlisle, is a United States Indian Industrial School. In 1910 the total number of communicants of different religious denominations in the state was 1,977,037, of whom 1,717,037 were Protestants and 1,217,344 were Roman Catholics. There is a large number of the smaller religious sects in the state; the principal denominations, with the number of communicants, are Methodism (262,443), Lutheran (353,643), Presbyterian (322,549), Reformed Church (177,270), Baptist (141,604), Protestant Episcopal (99,021), United Brethren (55,774), United Evangelical Church (45,880), Disciples of Christ (26,468), German Baptist Brethren (23,176), Eastern Orthodox Churches (21,123), Mennonites (16,527), Congregational (14,811), Evangelical Association (13,804), Friends (12,457), Church of God or “Winnebagoes” (11,157), and Moravian (5322). Of the total population in 1900, 3,293,337, or 51.4 per cent., were urban (i.e. in places having a population of 4000 or more), 762,846, or 12.1 per cent., were semi-urban (i.e. in incorporated places having a population less than 4000), and 2,315,932, or 35.4 per cent., were rural (i.e. outside of the incorporated places). From 1890 to 1900 the urban population increased by 651,730, or 39.3 per cent., and the semi-urban population increased by 134,077, or 18.4 per cent., but the rural population increased only 55,371, or 2.3 per cent. The population of the principal cities in 1900 were as follows: Philadelphia, 1,293,607; Pittsburg, 321,616; Allegheny, 126,896 (subsequently annexed to Pittsburg); Scranton, 112,026; Reading, 78,601; Erie, 57,733; Wilkes-Barre, 46,127; Altoona, 38,973; Johnstown, 35,936; Allentown, 35,416; McKeesport, 31,227; Chester, 33,988; York, 33,708; Williamsport, 28,757; New Castle, 28,399; Easton, 25,376; Norristown, 22,266; Shenandoah, 20,301; Shamokin (Borough), 19,414, and Lebanon, 17,628. 

Administration.—Pennsylvania has been governed under constitutions of 1776, 1790, 1874, and 1876; the present government is under the constitution of the 16th of December 1873, with amendments adopted on the 5th of November 1901. An amendment to the constitution to be adopted must be approved by a majority of the members elected to each house of the general assembly, and by a majority of the popular vote cast on the adoption of the amendment. All male citizens over 21 years of age, who have been citizens of the United States for one month, residents of the state for one year, and of the election district for two months immediately preceding the election, have the right of suffrage, provided they have paid within two years a state or county tax, which shall have been assessed at least two months and paid at least one month before the election. The Australian or “Massachusetts” ballot, adopted in 1801 under a law which fails to require personal registration, by a provision like that in Nebraska makes it easy to vote a straight ticket; party names are arranged on the ballot according to the number of votes secured by each party at the last preceding election. 

Executive.—The office of governor, superseded in 1776 by a president and council of twelve, was restored in 1790. Under the present constitution the governor is elected for four years, except for the next succeeding term. The governor and lieutenant-governor must be at least 30 years old, citizens of the United States, and of the state for seven years last preceding election; any party or person holding any office under the United States or Pennsylvania may be governor or lieutenant-governor. The governor controls a large amount of patronage, appointing, subject to the advice and consent of the council, the officers of the state; he may also revoke an act of the council during pleasure, and a superintendent of public instruction for four years, and may fill vacancies in various offices which occur during the recess of the senate. He has a right of veto, extending to items of legislation, which may be overridden by a two-thirds vote in each house. His power of pardon is limited, being subject to the recommendation of three members of a board which consists of the lieutenant-governor, secretary of the commonwealth, attorney-general, and the judges of the supreme court. All executive officials are the lieutenant-governor and the secretary of the state who, under the constitution, are elected for two years, the auditor-general, elected for three years, the treasurer, elected for two years, and (all appointed by the governor) the secretary of the commonwealth, the registrars of voters, and the justices of the peace. 

Legislature.—During the colonial period the legislature was composed of one house, but the bicameral system was adopted in the constitution of 1790. There are fifty senators, elected for four years, and approximately two hundred representatives, elected for two years. Senators must be at least 30 years old, representatives must be at least 21 years old, except for the first meeting of the first session of the assembly, and senators must have lived in the state from one year next before election and inhabitants of the senatorial districts from which each is elected for one year next before election; representatives must be at least 21 years old and must have lived in the state for three years next before election and inhabitants of the senatorial districts from which each is elected for one year next before election. To avoid the possibility of metropolitan domination provision is made that no city or county shall be entitled to more than one-sixth of the total number of sessions. Sessions are biennial. The powers of the two houses are the same except that the senate exercises the usual right of confirming appointments and of sitting as a court of impeachment, while the House of Representatives initiates money bills and impeachment cases. 

Judiciary.—The supreme court consists of seven judges elected by the voters of the state at large. Minority representation is secured by the provision that each elector shall vote for one less than the number of members of the house of representatives to be chosen at each election. The state is divided into districts of at least one county, and each senatorial district is a single judicial district. This court was formerly very much overworked, but it was relieved by an act of the 24th of June 1895 establishing a county court (consisting of seven judges) with appellate jurisdiction. There were in 1908 fifty-six district courts of common pleas, one for each county of forty thousand inhabitants and not more than four counties in a district. The judges of the common pleas are also judges of the courts of oyer and terminer, quarter sessions of the peace, and general quarter sessions of the peace. Although there are separate orphans’ courts in the counties (ten in 1909) having a population of more than one hundred and fifty thousand, judges of the peace are elected in wards, districts, boroughs and townships. In the colonial period all judges were appointed by the governor during good behaviour. The constitution of 1776 provided for terms of seven years, that of 1790 restored the life term, and that of 1876 fixed the terms for judges of the common pleas at ten years and judges of the supreme court at fifteen. A constitutional amendment of 1850 provided that all judges should be elected by the people. 

1 The constitution of 1873 made provision for minority representation as follows: “Whenever two judges of the supreme court are
At present supreme court judges serve for twenty-one years and are ineligible for re-election. Superior court and common pleas judges serve for ten years, and justices for five years. Judges may be impeached for misdemeanour in office or they may be removed by the supreme court for misconduct in their public employment. Any act of official misconduct in the general assembly, for any reasonable cause which shall not be sufficient ground for impeachment.

Local Government.—The local government is a combination of the counties, the townships, and the cities, townships, boroughs, and villages. There are thirty-five counties, each of which is composed of several townships. These in turn are divided into hundreds, townships, and villages. The county commissioners, elected for three years, are the chief executives of the county government. The county is divided into districts and the district is divided into townships. The township is the smallest unit of local government. The townships are divided into town, county, and finally federal. The townships are governed by the township officers, who are chosen for terms of three years. The townships are divided into townships and districts. The districts are divided into townships, and the townships are divided into villages. The villages are governed by the village officers, who are chosen for terms of three years.

The county officers are sheriffs, coroners, prothonotaries, registers of wills, recorders of deeds, commissioners, treasurers, surveyors, auditors or comptrollers, clerks of the courts, and district attorneys. The county officers are elected for terms of three years. The county officers are the chief executives of the county government. The county is divided into districts and the district is divided into townships. The townships are divided into townships and districts. The districts are divided into towns, and the towns are divided into villages. The villages are governed by the village officers, who are chosen for terms of three years. The village officers are the chief executives of the village government. The villages are divided into districts and the districts are divided into townships. The townships are divided into townships and districts. The districts are divided into towns, and the towns are divided into villages. The villages are governed by the village officers, who are chosen for terms of three years.
Pennsylvania

111

Counties. There is a biennial school appropriation of $15,000,000.
In addition the district directors levy local rates which must
not be greater than the state and county taxes combined. The
Pennsylvania state college at State College, Centre county, was
established in 1853 as the high school of Pennsylvania.

1862 became the Agricultural College of Pennsylvania, and received
its present name in 1874 after the income from the national land
grant had been appropriated to the use of the institutions; in
1909–1910 it had 147 instructors, 1400 students and a library of
37,000 volumes. In 1897 a state institute for higher education was the
University of Pennsylvania at Philadelphia (1749), an endowed
institution which receives very little support from the state; the
University of Pittsburgh (1874), at Pittsburgh (q.v.), Dickinson
College (q.v.), Gettysburg (1787), at Gettysburg; Franklin and Marshall
(German Reformed, 1825), at Lancaster; Washington and Jefferson
(United Presbyterian, 1825), at Washington; Lafayette (Presbyterian, 1832),
at Easton; Muhlenberg (Society of Friends, 1843), at Allentown;
Haverford; Franklin and Marshall; Allegheny College
Methodist Episcopal, 1815), at Meadville; Swarthmore
(Society of Friends, 1866), at Swarthmore; Juniata
(Lutheran, 1867), at Juniata; Lebanon; Lehigh University
(Lutheran, 1867), at Bethlehem; and for women Bryn Mawr College
(Society of Friends, 1885), at Bryn Mawr; the Allentown College
(German Reformed, 1867), at Allentown; Wilson College
(Presbyterian, 1870), and others. There are theological seminaries at
Pittsburgh, the Allegheny Seminary (United Presbyterian, 1825), Reformers Presbyterian (1856), and
Western Theological Seminary (Presbyterian, 1827); at
Lancaster; Mount Union; Mennonite (1857); at Meadville (United Presbyterians, 1857); at
Bethlehem (Moravian, 1807); at Chester, the Crozer Theological
Seminary (Baptist, 1868); at Gettysburg Lutheran (1826); and in
Philadelphia several schools, notably the Protestant Episcopal Church
divisional Seminary for the Southern Synod and a Lutheran theoretical
Airy. There are many technical and special schools, such as
Girard College, Drexel Institute and Franklin Institute at
Philadelphia, the Carnegie Institute at Pittsburgh and the United States
Institute of Technology at New York.

Finance.—The revenues of the state are derived primarily from
corporation taxes, business licenses, and a 5 % rate oncollateral
inheritance. Taxes on real estate have been abolished and those
on personal property are being reduced, although the heavy
taxes on personal property have been temporarily suspended.

In 1737 the total receipts for the year ending on the 30th of November 1709 were $29,945,310, and the expenditure
was $30,021,774. During the provincial period Pennsylvania, in common with all the other colonies, was affected with a
financial crisis. From 1727 to 1775 it issued $1,006,650 and from 1775 to 1778 $1,172,000 plus $1,550,000. Acts were passed in 1781,
1792, 1793 and 1794 to facilitate redemption at depreciated rates, and
in 1795 and 1796 they were renewed and continued in force until 1825. The state was also carried along by the movement which began about
1825 for the expenditure of internal improvements. On turnpikes, bridges, canals and railways $53,352,659 were
spent between 1830 and 1872. The public debt in 1830 was $32,000,000, and the
high-water mark of $2,128,434. An agitation was then begun
for redemption, the public works were put up for sale, and were
finally disposed of in 1858 (when the debt was $9,488,244) to the Pennsylvania Railroad Company for $7,580,000. Under authority of
a constitutional amendment of 1857 a sinking fund commission
was established in 1858. Aside from a temporary increase during
the Civil War (1861–65) the debt has been rapidly reduced. The
constitution of 1873 and subsequent legislation have continued
the commission, but the sources of revenue have been very much
curtailed, being restricted to the interest on the deposits of the
fund and interest on certain Allegheny Railroad bonds. The total
debt on the 30th of November 1909 was $2,643,917, of which the
gross surplus (17% bond) on$19,681,739.

The sinking fund at the same date amounted to $2,652,035,
leaving a net surplus in the sinking fund of $8118. The sinking fund was formerly divided among certain favoured banks in such
manner that the banks which entered the sinking fund received
interest which controlled the state; but after the reform victory in
the election of 1905 the sinking fund commission instituted the
policy of buying bonds at the market price, and the debt is now
being reduced by this method. The present Pennsylvania
than other national banks are created by state charters
limited to twenty years and are subject to the supervision of
a commissioner of banking.

History.—The chief features of Pennsylvania history in
colonial days were the predominance of Quaker influence, the
heterogeneous character of the population, liberty in matters
of religion, and the fact that it was the largest and the most
successful of proprietary provinces. The earliest European
settlements within the present limits of the state were some small
trading posts established by the Swedes and the Dutch in the
lower valley of the Delaware River in 1624–1681. Between
1650 and 1660 George Fox and a few other prominent members of
the Society of Friends had begun to urge the establishment
of a colony in America to serve as a refuge for Quakers who were
suffering persecution under the "Clarendon Code." William
Penn (q.v.) became interested in the plan at least as early as
1666. For his charters of 1680–1682 and the growth of the
colony under him see PENN, WILLIAM.

During Penn's life the colony was involved in serious boundary
disputes with Maryland, Virginia and New York. A decree
of Lord Chancellor Hardwicke, in 1750, settled the Maryland
Delaware dispute and led to the survey in 1763–1767 of the
boundary between Pennsylvania and Maryland (lat. 39° 43'
26° 3′ N.), called the Mason and Dixon line in honour of the
surveyors; it acquired considerable importance later as
separating the free and the slave states. In 1764 Virginia agreed
to the extension of the line and to the establishment of the western
limit (the present boundary between Pennsylvania and Ohio) as
the meridian from a point on the Mason and Dixon line five
degrees of longitude west of the Delaware river. The 42nd
parallel was finally selected as the northern boundary in 1780,
and in 1792 the federal government sold to Pennsylvania the
small triangular strip of territory north of it on Lake Erie. A
territorial dispute with Connecticut over the Wyoming Valley
was settled in favour of Pennsylvania in 1782 by a court of
arbitration appointed by the Continental Congress.

Upon William Penn's death, his widow became proprietary.
Sir William Keith, her deputy, was hostile to the council, which
he practically abolished, and was popular with the assembly,
which he assiduously courted, but was discharged by Mrs Penn
after he had quarrelled with James Logan, secretary of the
province. His successors, Patrick Gordon and George Thomas,
under the proprietorship of John, Thomas and Richard Penn,
continued Keith's popular policy of issuing a plentiful paper
currency; but with Thomas the assembly renewed its old struggle,
refusing to grant him a salary or supplies because of his efforts
to force the colony into supporting the Spanish War. Again,
during the Seven Years' War the assembly withheld the
government from William and Thomas, and the latter, Hunter Morris, in the matter of grants for military
expenses. But the assembly did its part in assisting General
Braddock to outfit; and after Braddock's defeat all western
Pennsylvania suffered terribly from Indian attacks. After
the proprietors subscribed £6,000 for the protection of the colony
the assembly momentarily gave up its contest for a tax on the
proprietary estates and consented to pass a money bill, without
this provision, for the expenses of the war. But in 1760 the assembly,
with the help of Benjamin Franklin as agent in
England, won the great victory of forcing the proprietors to
pay a tax (1166) to the colony; and thereafter the assembly
had little to contest for, and the degree of civil liberty attained
in the province was very high. But the growing power of
the Scotch-Irish, the resentment of the Quakers against the
proprietors for having gone back to the Church of England and
many other circumstances strengthened the anti-proprietary
power, and the assembly strove to abolish the proprietorship
and establish a royal province; John Dickinson was the able
leader of the party which defended the proprietors; and Joseph
Galloway and Benjamin Franklin were the leaders of the
anti-proprietary party, which was greatly weakened at home
by the absence after December 1764 of Franklin in England
as its agent. The question lost importance as independence
became the issue.

In 1755 a volunteer militia had been created and was led with
great success by Benjamin Franklin; and in 1765 a line of forts
was begun to hold the Indians in check. In the same year a
force of pioneers under John Armstrong of Carlisle surprised
and destroyed the Indian village of Kittanning (or Atiqua)
on the Allegheny river. But the frontier was disturbed by
Indian attacks until the suppression of Pontiac's conspiracy.
In December 1763 six Christian Indians, Conestogas, were
massacred by the " Paxton boys" from Paxton near the
present Harrisburg; the Indians who had escaped were taken
to Lancaster for safe keeping but were seized and killed by the "Paxton boys," who with other backwoodsmen marched upon Philadelphia early in 1764, but Quakers and Germans gathered quickly to protect it and civil war was averted, largely by the diplomacy of Franklin. The Paxton massacre marked the close of Quaker supremacy and the beginning of the predominance of the Scotch-Irish pioneers.

Owing to its central position, its liberal government, and its policy of religious toleration, Pennsylvania had become during the 18th century a refuge for European immigrants, especially persecuted sectaries. In no other colony were so many different races and religions represented. There were Dutch, Swedes, English, Germans, Welsh, Irish and Scotch-Irish; Quakers, Presbyterians, Episcopalians, Catholics, Lutherans (Reformed), Mennonites, Dunkers, Schwenkfelders, and Moravians. Most of these elements have now become merged in the general type, but there are still many communities in which the popular language is a corrupt German dialect, largely Rheno-Franconian in its origin, known as "Pennsylvania Dutch." Before the Seven Years' War the Quakers dominated the government, but from that time until the failure of the Whisky Insurrection (1774) the more belligerent Scotch-Irish (mostly Presbyterians) were used in support of the second numerical strength of the Scotch-Irish and the increasing dissatisfaction with Quaker neglect of means of defending the province.

As the central colony, Pennsylvania's attitude in the struggle with the mother country was of vast importance. The British party was strong because of the loyalty of the large Church of England element, the neutrality of many Quakers, Dunkers, and Mennonites, and a general satisfaction with the liberal and free government of the province, which had been won gradually and had not suffered such catastrophic reverses as had embittered the people of Massachusetts, for instance. But the Whig party under the leadership of John Dickinson, Thomas Mifflin and Joseph Reed was successful in the state, and Pennsylvania contributed greatly to the success of the War of Independence, by the important services rendered by her statemen, by providing troops and by the financial aid given by Robert Morris (q.v.). The two Continental Congresses (1774, and 1775-1781) met in Philadelphia, except that when Philadelphia was occupied by the British army and Congress met in Lancaster and York, Pennsylvania, and then in Princeton, New Jersey. In Philadelphia the second Congress adopted the Declaration of Independence, which the Pennsylvania delegation, excepting Franklin, thought premature at the time, but which was well supported by Pennsylvania afterwards. During the War of Independence battles were fought at Brandywine (1777), Paoli (1777), Fort Mifflin (1777) and Germantown (1777), and Washington's army spent the winter of 1777-1778 at Valley Forge; and Philadelphia was occupied by the British from the 26th of September 1777 to the 18th of June 1778. The Penn lost their governmental rights in 1776, and three years later their territorial interests were vested in the commonwealth in return for a grant of £120,000 and the guarantee of titles to private estates held in severalty. They still own considerable property in and around Wilkes-Barre, in Luzerne county, and in Philadelphia. The first state constitution of September 1776 was the work of the Radicals party. It deprived the Quakers of their part in the control of the government and many Conservatives into the Loyalist party. This first state constitution was never submitted to popular vote. It continued the unicameral legislative system, abolished the office of governor, and provided for an executive council of twelve members. It also created a curious body, known as the council of censors, whose duty it was to assemble once in seven years to decide whether there had been any infringements of the fundamental law. The party which had carried this constitution through attacked its opponents by withdrawing the charter of the college of Philadelphia (now the university of Pennsylvania) because its trustees were anti-constitutionalists and creating in its place a university of the state of Pennsylvania.

The Constitutional party in 1785 secured the annulment by the state assembly of the charter of the Bank of North America, which still retained a congressional charter; and the cause of this action also seems to have been party feeling against the anti-constitutionalists, among whom Robert Morris of the bank was a leader, and who, especially Morris, had opposed the paper money policy of the Constitutionalists. These actions of the state assembly against the college and the bank probably were immediate causes for the insertion in the Federal Constitution (adopted by the convention in Philadelphia in 1787) of the clause (proposed by James Wilson of Pennsylvania, a friend of the college and of the bank) forbidding any state to pass a law impairing the obligation of contracts. The state ratified the Federal Constitution, in spite of a powerful opposition—largely the old (state) Constitutional party—on the 22nd of December 1787, and three years later revised its own constitution to make it conform to that document. Under the constitution of 1790 the office of governor was restored, the executive council and the council of censors were abolished, and the bicameral legislative system was adopted. Philadelphia was the seat of the Federal government, except for a brief period in 1786-1790, until the removal to Washington in 1800. The state capital was moved from Philadelphia to Lancaster in 1799 and from Lancaster to Harrisburg in 1812.

The state was the scene of the Scotch-Irish revolt of 1794 against the Federal excise tax, known as the Whisky Insurrection (q.v.), and of the German protest (1799) against the house tax, known as the Fries Rebellion from its leader John Fries (q.v.). In 1838 as the result of a disputed election to the state house of representatives two houses were organized, one Whig and the other Democratic, and there was open violence in Harrisburg. The conflict has been called the "Buckshot War." The Whig House of Representatives gradually broke up, many members going over to the Democratic house, which had possession of the records and the chamber and was recognized by the state Senate. Pennsylvania was usually Democratic before the Civil War owing to the democratic character of its country population and to the close commercial relations between Philadelphia and the South. The growth of the protectionist movement and the development of anti-slavery sentiment, both of which were in the opposite direction, and of the Whig national ticket in 1840 and 1844 and the Southerners for Lincoln in 1860. A split among the Democrats in 1835, due to the opposition of the Germans to internal improvements and to the establishment of a public school system, resulted in the election as governor of Joseph Ritner, the anti-Masonic candidate. The anti-Masonic excitement subsided as quickly as it had risen, and under the leadership of Thaddeus Stevens the party soon became merged with the Whigs. During the Civil War (1861-1865) the state gave to the Union 336,000 soldiers; and Generals McClellan, Hancock, Meade and Reynolds and Admirals Porter and Dahlgren were natives of the state. Its nearness to the field of war made its position dangerous. Chambersburg was burned in 1862; and the battle of Gettysburg (July 1863), a defeat of Lee's attempt to invade the North in force was a turning point in the war.

The development of the material resources of the state since 1865 has been accompanied by several serious industrial disturbances. The railway riots of 1877, which centred at Pittsburg and Reading, resulted in the destruction of about two thousand freight cars and a considerable amount of labor property by an organized association, known as the Molly Maguines (q.v.), terrorized the mining regions for many years, but was finally suppressed through the courageous efforts of President Franklin Benjamin Gowen (1863-1885) of the Philadelphia & Reading railroad with the assistance of Allan Pinkerton and his detectives. There have been mining strikes at Scranton (1871), in the Lehigh and Schuylkill regions (1873), at Hazleton (1867), and one in the anthracite fields (1902) which was settled by a board of arbitrators appointed by President Roosevelt; and there were street railway strikes at Chester in 1908 and in Philadelphia in 1910. The calling in of Pinkerton detectives from Chicago and New

1 Lloyd was deputy-governor of the province, the present state of Pennsylvania; Markham of the lower counties, the present state of Delaware.
2 The state was governed by a supreme executive council in 1717-1722.
3 Governor Shunk resigned in July 1848 and was succeeded by W. F. Johnston, president of the state senate.
of these buildings is the law school, between Chestnut and Sansom Streets, on 34th Street. In a great triangular block bounded by Woodland Avenue, Spruce Street, and 34th Street the university library, which had in 1909 about 275,000 bound volumes and 50,000 pamphlets, including the Biddle Memorial law library (1860) of 40,000 volumes, the Colwell and Henry C. Carey collections in finance and economics, the Francis C. Macauley library of Italian, Spanish and Portuguese authors, with an excellent Dante collection, the classical library of Ernst von Leutsch of Göttingen, the philological library of F. A. Pott of Halle, the Germanic library of R. Bechstein of Rostock, the Semitic library of C. P. Caspari of Copenhagen, the (Hebrew and Rabbinical) Marcus Jastrow Memorial library, the ethnological library of D. B. Brinton, and several special medical collections; College Hall, with the university offices; Howard Houston Hall (1896) the students' club; Logan Hall; the Robert Hare chemical laboratory; and (across 36th Street) the Wistar institute of anatomy and biology. Immediately east of this triangular block are: Bennett House; the Randal Morgan laboratory of physics; the engineering building (1906); the laboratory of hygiene (1892); dental hall; and the John Harrison laboratory of chemistry. Farther east are the gymnasium, training quarters and Franklin (athletic) field, with brick grandstands. South of Spruce Street are the free museum of science and art (1899), the conservatory, and a part of a projected group of colonial halls, a valuable American, Egyptian, Semitic and Cretan collections, the last two being the results in part of university excavations at Nippur (1888-1902) and at Gouria (1901-1904); between 34th and 36th Streets the large and well-equipped university hospital (1874); large dormitories, consisting in 1909, of 29 distinct but connected houses; medical laboratories; a biological hall and vivarium; and across Woodland Avenue, a veterinary hall and hospital. The university contains various departments, including the college (giving degrees in arts, science, biology, music, architecture, &c.), the graduate school (1882), a department of law established in 1790 and re-established in 1850 and a department of medicine (first professor, 1756; first degrees granted, 1768), the oldest and probably the most famous medical school in America. Graduation from the school of arts in the college is dependent on the successful completion of 60 units of work (the unit is one hour's work a week for a year in lectures or recitations or two hour's work a week for a year in laboratory courses); this may be done in three, four or five years; of the 60 units: 22 must be required in studies (chemistry, 2 units; English, 6; foreign languages, 6; history, logic and ethics, mathematics, and physics, 2 each); 18 must be equally distributed in two or three "groups"—the 10 groups include astronomy, botany, chemistry, economics, English, fine arts, French, geology, German, Greek, history, Latin, mathematics, philosophy, physics, political science, psychology, sociology and zoology; and in the remaining 20 units the student's election is practically free. Special work in the senior year of the college counts 8 units for the first year's work in the department of medicine. College scholarships are largely local, two being in the gift of the governor of the state, fifty being for graduates of the public schools of the city of Philadelphia, and five being for graduates of Pennsylvania public schools outside Philadelphia; in 1909 there were twenty-eight scholarships in the college not local. In the graduate school there are five fellowships for research, each with an annual stipend of $800, twenty-one fellowships valued at $300 each, for men only, and five fellowships for women, besides special fellowships and 39 scholarships.

The corporation of the university is composed of a board of twenty-four trustees, of which the governor of Pennsylvania is ex-officio president. The directing head of the university, and the head of the university faculty and of the faculty of each department is the provost—a title rarely used in American universities; the provost is president pro temnepro of the board of trustees.

In 1908-1909 the university had 4,54 officers of instruction, of whom 220 were in the college and 157 in the department
of medicine, and an enrolment of 4570 students, of whom 2089 were in the college (412 in the school of arts; 987 in the Towne scientific school; 472 in the Wharton school, and 355 in the evening school of accounts and finance; 354 in courses for teachers; and 481 in the summer school), 353 in the state school, 357 in the department of law, 550 in the department of medicine, 385 in the department of dentistry, and 150 in the department of veterinary medicine.

In August 1907 the excess of the university's assets over its liabilities was $1,239,408 and the donations for the year were $305,814. A very large proportion of the university's investments is in real estate, especially in Philadelphia. In 1907 the total valuation of real estate (including the university buildings) was $8,299,154; and libraries, museum, and laboratories were valued at $2,025,357. Students' tuition fees vary from $150 to $200 a year in the college; and are $160 in the department of law, $250 in the department of medicine, $150 in the department of dentistry and $100 in the department of veterinary science. The income from tuition fees in 1906-1907 was $458,396; the payments for "educational salaries" amounted to $433,311, and for "administration salaries" to $135,314.

The university publishes the following series: Astronomical Series (1899 sqq.); Contributions from the Botanical Laboratory (1892 sqq.); Contributions from the Laboratory of Hygiene (1898 sqq.); Contributions from the Zoological Laboratory (1893 sqq.); Series in Botany, History of Agriculture, and Mathematics (1897 sqq.); Series in Philology and Language (1891 sqq.); Contributions from the Economic and Historical Researches (1907 sqq.); Series in Political Economy and Public Law (1885 sqq.); The American Law Review (1897 sqq.); The University of Pennsylvania Medical Bulletin (1888 sqq.); Transactions of the Department of既能ology (1904 sqq.); The Journal of Philology (1887 sqq.); and Transactions and Proceedings of the Botanical Society of Pennsylvania (1897 sqq.).

There are also occasional publications by institutes and departments connected with the university. Student publications include: a daily, The Pennsylvania (1885); the weekly, Old Line (1902); a comic monthly, The Punch Bowl; a literary monthly, The Red and Blue; a quarterly of the department of dentistry, The Penn Dental Journal; an annual, The Record; and The Alumni Register (1869), a monthly.

Benjamin Franklin in 1749 published a pamphlet, entitled Proposals Relating to the Education of Youth in Pennsylvania, which led to the formation of a board of twenty-four trustees, nineteen of whom, on the 13th of November 1749, met for organization and to promote "the Publick Academy in the City of Philadelphia," and elected Benjamin Franklin president of the board, an office which he held until 1756. So closely was Franklin identified with the plan that Matthew Arnold called the institution "the University of Franklin." On the 1st of February 1750 there was conveyed to this board of trustees the "New Building" on Fourth Street, an area which had been erected in 1740 for a charity school—a use to which it had not been put—and as a "house of Publick Worship," in which George Whitefield had preached in November 1749; the original trustees (including Franklin) of the "New Building" and of its projected charity school date from 1749, and therefore the university attaches to its seal the words "founded 1740." In the "New Building" the academy was opened on the 7th of January 1751, the city having voted £200 in the preceding August for the completion of the building. On the 16th of September 1751 a charitable school "for the instruction of poor Children gratis in Reading, Writing, and Arithmetic" was opened in the "New Building." The proprietaries, Thomas and Richard Penn, incorporated "The Trustees of the Academy and Charitable School in the Province of Pennsylvania" in 1753; and in 1755 issued a confirmatory charter, changing the corporation name to "The Trustees of the College, Academy and Charitable School." The incorporator William Smith (1727-1803) of the university of Aberdeen, who had been rector of the academy in 1752 and had taken orders in the Church of England in 1753, became provost of the college. In 1756 Dr Smith established a complete and liberal curriculum which was adopted by Bishop James Madison in 1777 when he became president of the College of William and Mary. In 1757 the first degree class graduated. Under Smith's control the Latin school grew in importance at the expense of the English school, to the great annoyance of Franklin. In 1762-1764 Dr Smith collected for the college in England about £6900; and in 1764 his influence had become so strong that it was feared that the college would become sectarian. The Penns and others deprecated this and the trustees bound themselves (1764) to "use their utmost endeavours that... (the original plan) be not narrowed, nor the members of the Church of England, nor those dissenting from them be put on any worse footing in this semiology than they were at the time of receiving the royal brief." From September 1777 to June 1778 college exercises were not held because Philadelphia was occupied by British troops. In 1779 the state legislature, on the ground that the trustees' declaration in 1764 was a "narrowing of the foundation," 1 confiscated the rights and property of the college and chartered a new corporation "the Trustees of the University of the State of Pennsylvania"; in 1789 the college was restored to its rights and property and Smith again became its provost; in 1791 the college and the university of the State of Pennsylvania were united under the title, "the University of Pennsylvania," whose trustees were elected from their own members by the board of trustees of the college and that of the university. In 1802 the university purchased new grounds on Ninth Street, between Market and Chestnut, where the post office building now is; there until 1829 the university occupied the building erected for the administrative mansion of the president of the United States; there new buildings were erected after 1829; and from these the university removed to its present site in 1837.

The provosts have been: in 1725-1779 and in 1789-1803, William Smith; in 1779-1791, of the university of the State of Pennsylvania, John Ewing (1732-1802); in 1803-1819, John McDowell (1756-1820), in 1810-1815, John Andrews (1746-1813); in 1815-1828, Frederick Beasley (1777-1843); in 1828-1833, William Heathcote De Lancey (1797-1865); in 1834-1835, John Ludlow (1793-1857); in 1854-1859, Henry Wethake (1792-1866); in 1860-1868, Daniel Raynes Goodwin (1811-1899); in 1868-1880, Charles Janeway Stille (1819-1899); in 1881-1894, William Pepper (1843-1898); in 1894-1910, Charles Curtis Harrison (b. 1844), and in 1911 sqq. Edgar Fahs Smith (b. 1856).

See T. H. Montgomery, A History of the University of Pennsylvania, from its Foundation to A.D. 1770 (Philadelphia, 1900); George B. Wood, Early History of the University of Pennsylvania (3rd ed., ibid., 1896); J. B. McMaster, The University of Pennsylvania (ibid., 1897); G. E. Nitzsche, A History of the University of Pennsylvania (ibid., 1900); and Edward P. Cheyney, "The Universities of Pennsylvania," in vol. i. of Universities and their Sons (Boston, 1901).

**PENNY** (Mid. Eng. peni or pen, from O. Eng. form penig, earlier penning and penning; the word appears in Ger. Pfennig and Du. penning; it has been connected with Du. pander, Ger. Pfland, and Eng. "pawm," the word meaning a little pledge or token, or with Ger. Pfanne, a pan), an English coin, equal in value to the one-twelfth of a shilling. It is one of the oldest of English coins, superseding the sceatta or sceat (see Numismatics; and Britain: Anglo Saxon, § "Coins"). It was introduced into England by Offa, king of Mercia, who took as a model a coin first struck by Pipin, father of Charlemagne, about 735, which was known in Europe as novus denarius. Offa's pennies were made of copper, weighed 220 grains, 240 pennies weighing one Saxon pound (or 16 English pounds, as it was afterwards called), hence the term pennyweight (dwt.). In 1527 the Tower pound of 5400 grains was abolished, and the new pound of 5760 grains adopted instead. The penny remained, with some few exceptions, the only coin issued in England until the introduction of the gold florin by Edward III. in 1343. It was not until the reign of Edward I. that halfpence and farthings became a regular part of the coinage, it having been usual to subdivide the penny for trade purposes by cutting it into halves and quarters, a practice said to have originated in the reign of Ethelred II. In 1257, in the reign of Henry III., a gold penny,

1 Probably the actual reason was that the assembly, dominated by the advocates of the radical constitution of 1776, was attempting to punish the trustees of the college, who were almost all "anticongressionalists."
of the value of twenty silver pence, was struck. The weight and value of the silver penny steadily declined from 1300 onwards, as will be seen from the following table:

The last coinage of silver pence for general circulation was in the reign of Charles II. (1661-1662), since which time they have only been coined for issue as royal alms on Maundy Thursdays. Copper halfpence were first issued in the reign of Charles II.'s reign, but it was not until 1707, in the reign of George III., that copper pence were struck. This copper penny weighed 1 oz. ofavoirdupois. In the same year copper twopences were issued weighing 2 oz., but they were found too cumbersome and were discontinued. In 1860 bronze was substituted for the copper coinage, the alloy containing 95 parts of copper, 4 of tin, and 1 of zinc. The weight was also reduced, 1 lb. of bronze being coined into 48 pennies, as against 24 pennies into which 1 lb. of copper was coined.

**PENN YAN**, a village and the county-seat of Yates county, New York, U.S.A., situated N. of Keuka Lake, on the outlet extending to Lake Seneca, about 170 m. W. of Albany, and about 95 m. E. by S. of Buffalo. Pop. (1905), 4594; (1910) 4597. It is served by the New York Central & Hudson River and the Northern Central railways and by electric railway to Branchport, and has steamboat connections with Hammondsport at the head of Keuka Lake. The lake, one of the most beautiful of the so-called "finger lakes" of central New York, abounds in lake and rainbow trout, black bass, pickerel and pike, and there are many summer cottages along its shores. At Keuka Park, on the west shore of the lake, is Keuka College (1890), and at Eggleston's Point is held a summer "natural science camp" for boys. The village is the seat of the Penn Yan Academy (1859). The lake furnishes water-power, and among the manufactures are paper, lumber, carriages, shoes, &c. Much ice is shipped from the village. Penn Yan is an important shipping point in the apple and grape-growing region of central New York, and winemaking is an important industry.

The first frame dwelling at Penn Yan was built in 1790; the village became the county-seat in 1823, when Yates county was created, and was incorporated in 1833. The first settlers were chiefly followers of Jemima Wilkinson (1735-1819), a religious enthusiast, born in Cumberland township, Providence county, Rhode Island, who asserted that she had received a divine commission. She preached in Rhode Island, Connecticut, Massachusetts and Pennsylvania. Obtaining a large tract (which was called Jerusalem in 1789) in the present Yates county, she founded in 1788 the village of Hopeton on the outlet of Keuka Lake about a mile from Seneca Lake. Many followers settled there, and she herself lived there until 1790. Some of her followers left her before 1800, and then the community gradually broke up. The name of the village is said to have been derived from the first syllables of "Pennsylvania" and "Yankee," as most of the early settlers were Pennsylvanians and New Englanders.

---

1 The figure of Britannia first appeared on this issue of copper coins. The original of Britannia is said to have been Frances Stewart, afterwards Duchess of Richmond (Popps, Diary, Feb. 25, 1667). It was in Charles II.'s reign, too, that the practice was established of placing the sovereign's bust in a direction contrary to that of his predecessor.

---

**PENNYROYAL** in botany, a herb formerly much used in medicine, the name being a corruption of the old herbalist's name "Pulsioll-royall," _Pulegium regium_. It is a member of the mint genus, and has been known to botanists since the time of Linnaeus as _Mentha pulegium_. It is a perennial herb with a slender branched stem, square in section, up to a foot in length and rooting at the lower nodes, small opposite stalked oval leaves about half-inch long, and dense clusters of small reddish-purple flowers in the leaf axils, forming almost globular whorls. It grows in damp gravelly places, especially near pools, on heaths and commons. It has a strong smell somewhat like that of spearmint, due to a volatile oil which is readily obtained by distillation with water, and is known in pharmacy as _Oleum pulegii_. The specific name recalls its supposed property of driving away fleas (_pulces_). Like the other mints it has a carminative and stimulant properties.

**PENOBSCOT**, a tribe of North American Indians of Algonquian stock. Their old range was the country around the river Penobscot in Maine. They sided with the French in the colonial wars, but made a treaty of peace with the English in 1749. They fought against the English in the War of Independence, and were subsequently settled on an island in the Penobscot river, near Oldtown.

**PENOGEOGRAPHY** (Lat. _poena_, punishment), the modern name given to penitentiary science, that concerned with the processes devised and adopted for the repression and prevention of crime. (See CRIME; CRIMINOLOGY; PRISON; JUVENILE OFFENDERS; RECIDIVISM, &c.)

**PENRHYN GEORGE SHOLTO GORDON DOUGLAS-PENNANT, 2nd Baron (1856–1907),** was the son of Colonel George Gordon Douglas (1800–1866), brother of the 19th earl of Morton, who, through his wife, Juliana, eldest daughter and coheir of George Hay Dawkins-Pennant, of Penrhyn Castle, Carnarvon, had large estates in Wales and elsewhere, and was created Baron Penrhyn in 1866. Dawkins had inherited the estates from Richard Penrhyn, who was created Baron Penry in 1763, the title becoming extinct on his death in 1808.

George Douglas-Pennant was conservative M.P. for Carnarvonshire in 1866–1868 and 1874–1880, and succeeded his father in the title in 1886. A keen sportsman, a benevolent landlord, a kind and considerate employer, Lord Penrhyn came of a proud race, and was himself of an imperious disposition. He came prominently before the public in 1897 and subsequent years in connexion with the famous strike at his Welsh slate quarries. During his father's lifetime the management of the Penrhyn quarry had been left practically to an elective committee of the operatives, and it was on the verge of bankruptcy when in 1885 he took matters in hand; he abolished the committee, and with the help of Mr. A. Young, whom he brought in from London as manager, he reorganized the business that this slate-quarry yielded a profit of something like £1,500 a year. The new men and new methods were, however, not to the taste of the trade unionists, and the quarrymen, and in 1897 when the "new unionism" was rampant in labour questions throughout England, a strike was deliberately fomented. Lord Penrhyn refused to recognize the union or its officials, though he was willing to consider any grievances from individual quarrymen, and a protracted struggle ensued, in which his determination was invincible. He became the object of the bitterest political hostility, and trade unionism exerted itself to the utmost, but vainly, to bring about some form of government intervention. Penrhyn strikers perambulated the country, singing and collecting contributions to their funds. But in spite of every pressure Lord Penrhyn insisted on being master of his own property, and by degrees the agitation collapsed. His death on the 10th of March 1907 evoked general and genuine regret. Lord Penrhyn was twice married, and had fifteen surviving children. He was succeeded in the title by his eldest son, Edward Sholto (b. 1864), who was Unionist M.P. for South Northamptonshire from 1893 to 1908.
PENRITH—PENRYN

PENRITH, a municipality of Cumberland county, New South Wales, Australia, on the Nepean River, 34 m. by rail W. by N. of Sydney. Penrith and the adjoining township of St Mary's are chiefly remarkable for their connexion with the railway. The iron tubular bridge which carries the line over the Nepean is the best of its kind in the colony, while the viaduct over Kuapsack Gulley is the most remarkable erection of its kind in Australia. There are large engineering works and railway fitting shops at Penrith, which is also the junction for all the western goods traffic. The inhabitants of both towns are mainly railway employees. Pop. (1901), of Penrith 3539, of St Mary's 1840.

PENRITH, a market town in the Penrith parliamentary division of Cumberland, England, in a valley near the river Eamont, on the Cockermouth, Keswick & Penrith, London & North Western and North Eastern railways. Pop. of urban district (1901), 9182. It contains some interesting brasses. A 14th-century grammar school was refounded by Queen Elizabeth; and there are two mansions dating from the same reign, which have been converted into inns. Though there are but few relics, tanneries and saw-mills, the town depends mainly on agriculture. There are some remains of a castle erected as a protection against the Scots. Near Penrith on the south, above the precipitous bank of the Eamont, stands a small but beautiful old castellated house, Yanwyth Hall. To the north-east of the town is Eden Hall, rebuilt in 1824. Among many fine paintings, it contains portraits by Hoppner, Kneller, Lely, Opie and Reynolds. The "Luck of Eden Hall," which has been celebrated in a ballad by the duke of Wharton, and in a second ballad written by Uhland, the German poet, and translated by Longfellow, is an enamelled goblet, kept in a leathern case dating from the times of Henry IV. or Henry V. It was long supposed to be Venetian, but has been identified as of rare Oriental workmanship. The legend tells how a seneschal of Eden Hall one day came upon a company of fairies dancing at St Cuthbert's Well in the park. "They flew away, leaving their cup at the water's edge, and singing " If that glass either break or fall, Farewell to the luck of Eden Hall." Its true history is unknown.

Penrith, otherwise Peneth, Peneth, Pereth, was founded by the Cambro-Celts, but on a site farther north than the present town. In 1222 Henry III. granted a yearly fair extending from the eve of Whitsun to the Monday after Trinity and a weekly market on Wednesday, but some time before 1787 the market day was changed to Tuesday. The manor in 1242 was handed over to the Scottish king who held it till 1295, when Edward I. seized it. In 1307 Richard II. granted it to Ralph Neville, first earl of Westmorland; it then passed to Warwick the kingmaker and on his death to the crown. In 1569 William III. granted the honour of Penrith to the earl of Portland, by whose descendant it was sold in 1387 to the duke of Devonshire. A court leet and view of frankpledge have been held here from time immemorial. In the 18th and early part of the 19th century Penrith manufactured checks, linen cloth and gingham, but the introduction of machinery put an end to this industry, only the making of rug carpets surviving. Clock and watch-making seems to have been an important trade here in the 18th century. The town suffered much from the incursions of the Scots, and Ralph, earl of Westmorland, who died 1426, built the castle, but a tower called the Bishop's Tower had been previously erected on the same site. In 1597-1598 a terrible visitation of plague attacked the town, in which, according to an old inscription on the church, 2260 persons perished in Penrith, by which perhaps is meant the rural deanery. During the Civil War the castle was dismantled by the Royalist commandant. In 1745 Prince Charles Edward twice marched through Penrith, and a skirmish took place at Clifton. The church of St Andrew is of unknown foundation, but the list of vicars is complete from 1223.

PENRY, JOHN (1539-1633), Welsh Puritan, was born in Brecknockshire in 1539; tradition points to Cwm Brith, a farm near Llangammarch, as his birthplace. He matriculated at Peterhouse, Cambridge, in December 1580, being then almost certainly a Roman Catholic; but soon became a convinced Protestant with strong Puritan leanings. Having graduated B.A., he migrated to St Alban's Hall, Oxford, and proceeded M.A. in July 1586. He did not seek episcopal ordination, but was licensed as University Preacher. The tradition of his preaching tours in Wales is slenderly supported; they could only have been made during a few months of 1586 or the autumn of 1587. At this time ignorance and immorality abounded in Wales. In 1562 an act of parliament had made provision for translating the Bible into Welsh, and the New Testament was issued in 1567; but the number printed would barely supply a copy for each parish church. Indignant at this negligence, Penry published, early in 1587, The Aequity of an Humble Suppllication—in the behalf of the country of Wales, that some order may be taken for the preaching of the Gospel among those people. Archbishop Whitgift, angry at the implied rebuke, caused him to be brought before the High Commission and imprisoned for about a month. On his release Penry married a lady of Northampton, which town was his home for some years. With the assistance of Sir Richard Molyneux and others, he set up a printing press, which for nearly a year from Michaelmas 1588 was in active operation. It was successively located at East Mousely (Surrey), Fawsley (Northampton), Coventry and other places in Warwickshire, and finally at Manchester, where it was seized in August 1589. On it were printed Penry's Exhortation to the governors and people of Wales, and View of ... such publick wants and disorders as are in the service of God ... in Wales; as well as the celebrated Martin Marprelate tracts. In January 1590 his house at Northampton was searched and his papers seized, but he succeeded in escaping to Scotland. There he published several tracts, as well as a translation of a learned theological work known as Theses Geneenses. Returning to England in September 1592, he joined the Separatist Church in London, in which he declined to take office, though after the arrest of the ministers, Francis Johnson and John Greenwood, he seems to have been the regular preacher. He was arrested in March 1593, and efforts were made to find some pretext for his conviction. Failing this a charge of sedition was based on the rough draft of a petition to the queen that had been found among his private papers; the language of which was indeed harsh and offensive, but had been neither presented nor published. He was convicted by the Queen's Bench on the 21st of May 1593, and hanged on the 29th at the usual hour of 4 p.m., the signature of his old enemy Whitgift being the first of those affixed to the warrant.

See the Life, by John Waddington (1854).
PENSACOLA—PENSION

aldermen and twelve councillors, markets on Wednesdays and Saturdays, and fairs on the 1st of May, the 7th of July and the 21st of December. The charter having been surrendered to James II. by a new charter inter alia confined the parliamentary franchise to members of the corporation. This proviso however was soon disregarded, the franchise being freely exercised by all the inhabitants paying scot and lot. An attempt to deprive the borough of its members, owing to corrupt practices, was defeated by the House of Lords in 1827. The act of 1832 extended the franchise to Falmouth in spite of the rivalry existing between the two boroughs, which one of the sitting members asserted was so great that no Penryn man was ever known to marry a Falmouth woman. In 1835 the united borough was deprived of one of its members. The corporation of Penryn was remodelled in 1835, the aldermen being reduced to four. Its foreign trade, which dates from the 14th century, is considerable. The extra-parochial collegiate church of Glenavy, founded by Bishop Bronescombe in 1265, had a revenue at the time of its suppression under the act of 1545 of £2121.18s. 4d. See Victoria County History, Cornwall; T. C. Peter, Glenavy Collegiate Church.

PENSACOLA, a city, port of entry, and the county-seat of Escambia county, Florida, USA., in the N.W. part of the state. Pensacola Bay and the mouth of the Escambia River are situated on the N. of the Gulf of Mexico. Pop. (1900) 17,747; (1910) 22,982. It ranks second in size among the cities of Florida. The city is served by the Louisville & Nashville and the Pensacola, Alabama & Tennessee railways, and by steamers to West Indian, European and United States ports. The harbour is the most important deep-water harbour south of Hampton Roads. The narrow entrance is easily navigable and is defended by Fort Pickens on the west end of Santa Rosa Island, with a great sea-wall on the Gulf side (completed in 1900), Fort McRee on a small peninsula directly opposite, and Fort Barrancas on the mainland immediately north-east of Fort McRee. On the mainland 1 m. east of Fort Barrancas are a United States Naval Station, consisting of a yard (84 acres enclosed) with shops, a steel floating dry dock and marine barracks; and a reservation (1800 acres) on which are a naval hospital, a naval magazine, two timber ponds, a national cemetery, and the two villages of Warrington and Woodley, with a population of about 1500, mostly employés of the yard. The city's principal public buildings are the state armoury, the Federal building, and the city hall. The mean temperature is about 72° F., made cooler from the Gulf temper the heat. Pensacola is a shipping point for lumber, naval stores, tobacco, phosphate rock, fish, cotton and cotton-seed oil, meal and cake, and is one of the principal markets in the United States for naval stores. In 1805 the foreign exports were valued at $3,196,600, in 1807 at $3,436,679, and in 1909 at $26,971,679; the imports in 1909 were valued at $1,479,017. The important factor in this vast development has been the Louisville & Nashville railway, which after 1895 built extensive warehouses and docks at Pensacola. There are excellent coaling docks—good coal is brought hither from Alabama—and a grain elevator. Among the manufactures are sashes, doors and blinds, whiting, fertilizers, rosin and turpentine, and drugs.

Pensacola Bay may have been visited by Ponce de Leon in 1513 and by Panfilo de Narvaez in 1528. In 1540 Maldonado, the commander of the fleet that brought De Sojo to the Florida coast, entered the harbour, which he named Fuerta d'Auchusi, and on his recommendation De Soto designated it as a basis of supplies for his expedition into the interior. In 1554 a permanent settlement was made by the Spaniards in the vicinity, to which Santa Maria, the town founded by De Luna, was moved to the hospital Santa Maria, but two years later this settlement was abandoned. In 1696 another settlement was made by Don Andres d'Arriola, who built Fort San Carlos near the site of the present Fort Barrancas, and seems to have named the place Pensacola. In 1719, Spain and France, being at war, Pensacola was captured by Sieur de Bienvile, the French government of Louisiana. Later in the same year it was successively re-taken by a Spanish force from Havana and recaptured by Bienvile, who burned the town and destroyed the fort. In 1723, three years after the close of hostilities, Bienvile relinquished possession. The Spanish then transferred their settlement to the west end of Santa Rosa Island, but after a destructive hurricane in 1754 they returned to the mainland. In 1763, when the Floridas were ceded to Great Britain, Pensacola became the seat of administration for West Florida and most of the Spanish inhabitants removed to Mexico and Cuba. During the War of American Independence the town was a place of refuge for many Loyalists from the northern colonies. On the 9th of May 1781 it was captured by Don Bernardo de Galvez, the Spanish governor at New Orleans. Most of the English inhabitants left, but trade remained in the hands of English merchants. During the War of 1812 the British made Pensacola the centre of expeditions against the Americans, and in 1814 a British fleet entered the harbour to take formal possession. In retaliation General Andrew Jackson attacked the town, driving back the British. In 1818, on the ground that the Spanish encouraged the Seminole Indians in their attacks upon the American settlements in the vicinity, Jackson again captured Pensacola, and in 1819 transferred it to the United States. On the 15th of January 1861 the Navy Yard was seized by order of the state government, but Fort Pickens, defended first by an insignificant force under Lieut. Adam J. Semler (1828–68) and afterwards by a larger force under Lieut.-Colonel Harvey Brown (1796–1874), remained in the hands of the Union forces, and on the 8th of May 1862 the Confederates abandoned Pensacola. Pensacola was chartered as a city in 1895.

PENSHURST, a village in the south-western parliamentary division of Kent, England, at the confluence of the Eden and Medway, 43 m. S.W. of Tonbridge. Pop. (1901), 1678. The village is remarkable for some old houses, including a timbered house of the 15th century, and for a noted factory of cricket implements. The church, chiefly late Perpendicular, contains a large number of monuments of the Sidney family and an effigy of Sir Stephen de Penchester, Warden of the Cinque Ports in the time of Edward I. Penshurst Place is celebrated as the home of the Sidney family. Anciently the residence of Sir Stephen de Penchester, Penshurst was granted to Henry, 2nd earl of Kent, by his grandson, Sir Philip Sidney, who was born here in 1554. It passed to Sir Philip's younger brother Robert, who in 1618 was created earl of Leicester. On the death of the seventh earl in 1743 the estates devolved upon his niece Elizabeth, whose only child married Sir Byshe Shelley of Castle Goring. Their son was created a baronet in 1818 as Sir John Shelley-Sidney, and his son was created Baron de L'Isle and Dudley in 1835. The mansion is quadrangular, and has a fine court, chapel and hall (c. 1341) with open timber roof and a minstrels' gallery. The various rooms contain an interesting collection of portraits, armour and other family relics. The praises of the park and the house have been sung in various Sir Philip Sidney's Arcadia, and by Ben Jonson, Edmund Waller and Robert Southey.

PENSION (Lat. pensio, a payment, from pendere, to weigh, to pay), a regular or periodical payment made by private employers, corporations or governments, in consideration either of past services or of the abolition of a post or office. Such a pension takes effect on retirement or when the period of service is over. The word is also used in the sense of the payment by members of a society in respect of dues.

United Kingdom.

In the United Kingdom the majority of persons in the employ of the government are entitled to pensions on reaching a certain age and after having served the state for a certain minimum number of years. That such is the case, and moreover that it is usual to define such pensions as being given in consideration of past services, has led to the putting forward very generally the argument that pensions, whether given by a government or
PENSION

by private employers, are in the nature of deferred pay, and that holders of posts which carry pensions must therefore be rewarded by a remuneration less than the full market rate, by the difference of the value of the pension. This view is hardly correct, for the object of attaching a pension to a post is not merely to reward past services, but to attract continued service by the holder as well as to enable the employer to dispense with the services of the employed without hardship to him should age or infirmity render him less efficient. Dissatisfaction had been expressed from time to time by members of the English civil service with the system in force, viz. that the benefit of long service was confined only to survivors, and that no advantage accrued to the representatives of those who died in service. This was altered by an act of 1900. See Royal Commission on Superannuation in the Civil Service: Report and Evidence (1903). For the general pensions given by the state to the aged poor see OLD AGE PENSIONS.

Civil Service.—In the English civil service the grant of pensions on superannuation is regulated by statute, the four principal acts being the Superannuation Acts of 1834, 1859, 1887 and 1899. To qualify for a pension it is necessary that (1) a civil servant should have been in the service of the Crown for the number of years prescribed by the service commissioners, or hold an office specially exempted from this requirement; (2) that he should give his whole time to the public service; (3) that he should draw the emoluments of his office for at least five years, and do his best to discharge the duties of the same for not less than ten years; (4) that if under the age of 60 years he should be entitled to be permanently incapacitated from the discharge of the duties of the office, or from infirmity of body or mind, of discharging his official duties, or have been required by the Crown to retire on the ground that he was unable or improper to discharge his duties efficiently. On retirement on these conditions a civil servant is entitled to a pension calculated at one-eighth of his retiring salary (or, in certain cases, of his average salary for the last five years), subject to a maximum of a maximum of forty-eighths. Civil servants retiring on the ground of ill health after less than ten years' service qualify for a gratuity of one month's pay for each year of service. Previous to the Royal Commission on Service pensions, pay was calculated on the rate of one-sixtieth of the retiring salary for each completed year of service, subject to a maximum of forty-sixths. This is the rate still for those who entered the service previous to the passing of the Superannuation Act of 1834, but in the case of a civil servant, pay is calculated under the terms of the permission in the act to take advantage of its provisions, which were more than a compensation for the lowering of the rate. The act gave power to the Treasury to grant by way of additional allowance to a civil servant who retired after not less than two years' service, in addition to his superannuation, a lump sum equal to one-thirtieth of his annual salary and emoluments multiplied by the number of completed years he has served, so that such lump sum may be as high as £1,500. But after attaining the age of sixty-five years, there must be deducted from that lump sum one-twentieth for each completed year that he has served after attaining that age. In the case of those retiring on the grounds of incapacity, the same rule applies, and as to the retirement allowance, this additional allowance is increased by an additional allowance of one-half per cent. for each completed year served at the passing of the act. The act also provided that where a civil servant died after serving five years or upwards, a gratuity equal to his annual salary and emoluments might be granted to his legal personal representatives. Where the civil servant attains the age of sixty-five this gratuity is reduced by one-twentieth for each completed year beyond that age. On the other hand, where the civil servant has died in the service of the Crown, but his death on account of superannuation is less than his annual salary his representatives may receive the difference as a gratuity. Provision was also made in the act for granting compensation on account of the pecuniary loss sustained or to be sustained by any civil servant not exceeding what the recipient might be granted or be entitled to if he retired on the grounds of ill health. Pensions are also sometimes awarded in excess of the scale as a reward for special services, as compensation for injury in certain cases, or to holders of professional offices, appointed at an age exceeding that at which public service ordinarily begins. In the estimates for civil services for the year 1909-1910, there was provided for non-effective and chargeable pensions in the civil service the sum of £5,664,735, and the sum of £1,576,750 on the Consolidated Fund, which was afterwards paid £5,233,333. The Duke of Hamilton, as hereditary keeper of the palace, Holyrood House, received a perpetual pension of £45,10s., and the Duchesses of Buccleuch and Portland, a salary of £2,714,10s., and other allowances to the amount of £5,333,333. The conclusion of the committee was that pensions, allowances and payments should not in future be granted in perpetuity, on the ground that such grants should be limited to the person actually rendering the services, and that such rewards should be defrayed by the generation benefited; that offices with salaries and without duties, or with merely nominal duties, ought to
to be abolished; that all existing perpetual pensions and payments and all hereditary offices should be abolished: that no service or merely nominal service is rendered by the holder of an hereditary office or the original grantee of a pension, the pension or payment should in no case continue beyond the life of the person upon whose authority and that in all cases the method of commutation ought to ensure a real and substantial saving to the nation (the existing rate, about 27 years' purchase, being considered by the committee to be too high); and that these recommendations are submitted to the government and outstanding hereditary pensions were gradually commuted, the only ones left outstanding being those to Lord Rodney (£2000) and to Earl Nelson (£5000), both chargeable on the consolidated fund.

Pension Pensions.—By the Political Offices Pension Act 1869, pensions were instituted for those who had held political office. For the purposes of the act political offices were divided into three classes: (1) those with a yearly salary of not less than £5000; (2) those with a salary of less than £5000 and not less than £2000; (3) those with a salary of less than £2000 and more than £1000.

For service in these offices there may be awarded pensions for life in the following scale: (1) a first class pension not exceeding £2000 a year, in respect of not more than five years in an office of the first class; (2) a second class pension not exceeding £1200, in respect of service of not less than six years or its equivalent, in an office of the second class; (3) a third class pension not exceeding £800 a year, in respect of service of not less than ten years in an office of the third class. The service need not be continuous, and the act makes provision for counting service in lower classes as a qualification for pension in a higher class. These pensions are payable during the lifetime of the pensioner and are not transferable or payable to another pension out of the public revenue, if so, he must inform the treasury and surrender it if it exceeds his pension or, if under he must deduct the amount. He may, however, hold office without paying the pension until it is reduced or paid off. To obtain a political pension, the applicant must file a declaration stating the grounds upon which he claims it and that his income from other sources is not sufficient to maintain his station.

Civil List Pensions.—These are pensions granted by the sovereign from the civil list upon the recommendation of the first lord of the treasury. By 1 & 2 Vict. c. 2 they are to be granted to "such persons only as have just claims on the royal benevolence or for the public service of the kingdom, who have been removed from the civil list and are not in receipt of pensions and allowances for the maintenance of themselves or their families, or by the discovery of a talent for literature, and in the arts, and have the merit of having sustained the dignity of the public service with fidelity and credit." The pensions are payable during the lifetime of the pensioner and are not transferable or payable to another pension out of the public revenue, if so, he must inform the treasury and surrender it if it exceeds his pension, or, if under he must deduct the amount. He may, however, hold office without paying the pension until it is reduced or paid off. To obtain a pension, the applicant must file a declaration stating the grounds upon which he claims it and that his income from other sources is not sufficient to maintain his station.

Ecclesiastical Pensions.—Bishops, deans, canons or incumbents who are incapacitated by age or infirmity from the discharge of their respective offices may receive pensions which are a charge upon the revenues of the see or cure vacated.

Navy pensions were first instituted by William III. in 1693 and regularly established by an order in council of Queen Anne in 1700. Since then the officers of the naval service have been entitled to pensions upon attaining a certain age, and their salaries varying according to the rank attained. The following table shows the pensions and funds for officers of the Royal Navy and the amounts charged upon the navy for the maintenance of the officers and their families:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Pension Fund</th>
<th>Maintenance Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rear-Admiral</td>
<td>£1500</td>
<td>£600</td>
</tr>
<tr>
<td>Admiral</td>
<td>£2000</td>
<td>£700</td>
</tr>
<tr>
<td>Vice-Admiral</td>
<td>£1200</td>
<td>£500</td>
</tr>
<tr>
<td>Captain</td>
<td>£900</td>
<td>£400</td>
</tr>
<tr>
<td>Lieutenant</td>
<td>£600</td>
<td>£300</td>
</tr>
<tr>
<td>Midshipman</td>
<td>£300</td>
<td>£200</td>
</tr>
</tbody>
</table>

Pensions of captains who retire at the age of 55, commanders, who retire at 50, and lieutenants who retire at 45, are allowed five years' pension at £20 per annum for each year of service. The pension of a petty officer, who retires at the age of 60, is £10 per annum for each year of service. The pension of a seaman is £2 per year for each year of service.
PENSION

For service in excess of 21 years, the following amounts are added to the pensions enumerated above:

<table>
<thead>
<tr>
<th>Classes</th>
<th>For each complete year in excess of 21 years.</th>
</tr>
</thead>
<tbody>
<tr>
<td>I.</td>
<td>1d. per diem to 9d. per diem.</td>
</tr>
<tr>
<td>IV.</td>
<td>2d. per diem to 5d. per diem.</td>
</tr>
</tbody>
</table>

A man promoted to higher rank within one year of his completing 20 years' service, receives, on his discharge in the higher rank, an extra 3d. per diem, provided that he has completed 25 years' service in all. An additional pension of 6d. per diem is awarded for gallant conduct, in the case of warrant officers.

N.C.O.'s and men disabled through military service are granted the following pensions:

<table>
<thead>
<tr>
<th>If partially capable of earning a livelihood</th>
<th>Per diem</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class I to III.</td>
<td>1s. to 3s.</td>
</tr>
<tr>
<td>IV.</td>
<td>9d. to 2s.</td>
</tr>
<tr>

Pensions may also be granted to N.C.O.'s and men who are disabled according to other military service, causing to circumstances.

United States.

In the ordinary sense of the word, pensions in the United States are confined to federal judges and officers of the army and navy, but the United States "Pension Fund" is so singular a feature of the national budget, that it is desirable to give an account of the different classes of allowances which are granted. In the United States, allowances for services in war or the 4th of March 1861 are called "old war" pensions, and may be divided into three classes, viz., (1) invalid pensions, based upon wounds or injuries received, or disease contracted in the course of duty, (2) "service" pensions, and (3) land bounties, both granted for service irrespective of injuries.

The first provision made by Congress for pensions was passed on the 26th of August 1776, promising invalid pensions to officers and men of the army or navy who lost a limb or were otherwise disabled in the War of Independence, at a rate equal to half of their monthly pay as officers or soldiers during life or continuance of the disability, those not totally disabled to receive an adequate monthly pension not to exceed half of their pay. Then followed various Acts of Congress enlarging the provisions for invalid pensions and extending them to those who had been in the war of 1812, and to the widows and children of those who died in the war or from wounds received in the war. The act of the 3rd of May 1846, provided for pensions in respect of the service of those volunteers wounded or otherwise disabled in service. Other acts were subsequently passed making further provision for pension on account of service in the Mexican War. The first general law providing pensions on account of the war of 1812 was passed in 1818, March 1818, thirty-five years after the termination of the War of Independence. Its beneficiaries were required to be in indigent circumstances and in need of assistance from their country. Two years later Congress became alarmed by reason of the large number of claims filed (about 8000), and enacted what was known as the "Alarm Act," requiring each applicant for pension and each pensioner on the rolls to furnish a schedule of his whole estate and income, clothing and bedding excepted. Many pensioners were dropped who were possessed of property. Numerous acts were, however, passed from time to time liberalizing the law or dealing more generously with the survivors of the Revolution. Service pensions were not granted to widows of the soldiers of this war until 1856, and then only on condition that the marriage of the soldier was prior to his last service, and that the soldier's service was not less than six months. In 1853, seventy years after the close of the war, the limitations were removed, and in 1908 two pensions based upon service in the War of Independence. The last survivor was Daniel F. Bakeman, who died on the 4th of August 1866, aged 109 years and 6 months.

The first law granting service pensions on account of the war of 1812 was passed in 1871, fifty-six years after the close of the war. This act required sixty days' service. Widows were not pensionable unless the marriage to the soldier had taken place prior to the treaty of peace of 1815. On 6th March 1878, sixty-three years after the war, an act was passed reducing the requisite period of service to fourteen days and removing the limitations as to date of marriage. In 1908 the pension rolls contained the names of 471 widows of this war, the last male survivor having died in 1905, at the age of 105 years. Service pensions were provided for those who served in the Black Hawk war, Creek war, Cherokee disturbances and the Seminole war (1822 to 1824). In all, 7036 acts were passed in the course of the war; they were granted to those who had served for thirty days, and were honourably discharged, and to their widows. In 1900 there were 1820 survivors and 3018 widows, pensioners of the service who were entitled to the benefits of that war.

Pensions were granted to those who were honourably discharged and to their widows, to those who were granted pension for twenty years of age, or disabled or dependent. This law was liberalized by the acts of the 5th of January 1893, 23rd of April 1900, 6th of February 1907, and 19th of April 1908, increasing the pension to $15 for those who have reached the age of seventy years, and to $20 for those reaching the age of seventy-five. In 1908 the pension rolls contained the names of 2932 survivors and 6914 widows on account of service in the Mexican War. To give title to bounty land, service must have been for at least fourteen days or in a battle prior to the Mexican War. Under its terms, it was granted to the survivors of the war who had been in some war in which the United States was engaged. Bounty land warrants are issued for 160 acres, and over 70,000,000 acres have been granted under the different Bounty Land Acts.

In the United States, grants of land were not made to the army or navy of the United States, or in their various branches, the law provided two distinct systems of pensioning—(1) the general laws, granting pensions for wounds or injuries received, or disease contracted in service, the pension to vary from $6 to $100 per month; and (2) the so-called Dependent Pension Act and amending acts, granting pensions for permanent disabilities regardless of the time and manner of their origin, provided they were incurred in the performance of duty. In 1908 the pension rolls contained the names of 142,044, and the number of widows and dependents, 81,165.

The Dependent Pension Act was based upon an Act of Congress approved 27th June 1890, which was amended on 9th May 1900. Properly speaking, it might be called "dependent" only as regards widows and parents. The main conditions as to service were similar to those of the "service" pension, but the soldier was entitled to an annual pension of $25 ($10 and $12 per month). Widows became entitled under this law if the soldier or sailor prior to 27th June 1890, provided they were without means of support other than their daily labour, and an actual income of less than $250 per year, or if the veteran was disabled by the same conditions as applied to claims of widows, except that their dependence was presumed, and need not be shown by evidence. A minor child was insane, idiotic or otherwise physically or mentally incapable of self-support, and the soldier was entitled to the pension during the period of disability. Further acts made more liberal provisions. That of the 6th of February 1907, granted pensions...
to persons who had served ninety days or more in the military or naval service in the civil war, or sixty days in the Mexican war, and were honourably discharged, no other conditions being attached. The rate of pension was fixed at $12 per month when sixty-two years of age, $15 per month when seventy years of age and $20 per month when seventy-five years of age. On the 1st of April 1908, fixed the rate of pension for widows, minor children under the age of sixteen and helpless minors on the roll or afterwards to be placed on it at $12 per month, and granted pensions at the same rate, to widows of persons who served ninety days or more during the civil war, without regard to their pecuniary condition. In 1908 there were 140,600 invalids on the roll, and 4294 minor and helpless children. In the same year under the act of 1907 there were 28,500, and 17,000 helpless children. Act of 1915 added 2,345 widows were put on the roll. All women employed by competent authority as nurses during the Civil War for six months or more, who are unable to earn a support, are granted a pension of $12 per month by an act of the 5th of August 1892. In 1908 the pension rolls contained the names of 3,110 pensioners under this act.

There were on the roll in 1908 on account of the Spanish war, 11,786 invalids and 3722 dependents. The total amount paid in pensions in 1908 on account of the Spanish war and the revolution in the Philippine Islands was $3,654,122. The grand total of pensioners on the roll for all wars was, in 1908, 951,687.

In addition to pensions, the United States government grants the following gratuities: First gratuities: Pension grants to veterans of the war who lost a limb in the service, or as a result of his service in line of duty, he shall have an artificial limb free of cost every three years, or commutation thereof, and transportation to and from a place where he shall select the artificial limb. Second: An honourably discharged soldier or sailor, or pensioner, who is unable to earn a support, and of whose incapacity, trust and profit, and preference for retention in all civil service positions. Third: There are ten National Soldiers' Homes situated at convenient and healthy points in different parts of the country, which are maintained, gratuitously, for the purpose of providing library and amusements of different kinds are provided free of all expense; government providing the soldiers free transportation to and from the homes, and transportation of pensioners while they are members of the homes. Fourth: There are thirty homes maintained by the different states, which are similar in their purpose to the National Homes, the sum of $100 per year being paid by the general government for each inmate. Many of these state homes also provide for the wives and children of the inmates, and they need not be separated while they are members of such home. Fifth: Schools are established by the different states for the maintenance and education of soldiers' orphans until they attain the age of sixteen years.

From the Civil War to 1908, the government of the United States paid to its pensioners for that war the sum of $3,533,593,025. The payments on account of all wars for the fiscal year ended on the 30th of June 1908 were $153,092,086. Over 1,000,000 persons pass through making medical examinations of pensioners and applicants for pensions. The total disbursement for pensions from 1790 to 1908 amounted to $3,751,108,809.

The pentamer, or Penumata, the name given to the second and shorter line of the classical elegiac verse. It is composed of five (mère) feet or measures (μέτρα) and is divided into two equal parts of two and a half feet each: the second of these parts must be dactyl, and the first may be either dactyl or spondaic. The first part must never overlap into the second, but there must be a break between them. Thus:

```
- | - | - | - | -
```

In the best Latin poets, the first foot of each part of the penta-meter is a dactyl. The pentameter scarcely exists except in conjunction with the hexameter, to which it always succeeds in elegaic verse. The invention of the rigidly dactylic form was attributed by the Greeks to Archilochus. Schiller described the sound and method of the elegiac couplet in two very skillful verses, which have been copied in many languages:

Im Hexameter steigt des Springquells flüsige Säule,
Im Pentameter drauf fallen sie melodisch herab.

The pentameter was always considered to add a melancholy air to verse, and it was especially beloved by the Greeks in those recitations (παραβράζεις) to the sound of the flute, which formed the earliest melodic performances at Delphi and elsewhere.

PENTASTOMIDA, or Linguatulina, verminiform entoparasitic animals, of which the exact zoological position is unknown, although they are usually regarded as highly modified degenerate Archinida of the order Acari.

The body is sub-cylindrical or somewhat convex above, flatter below, broad and oval in front and narrowed and elongate behind. Its integument is marked by a large number of transverse grooves simulating the segmentation of Annelids, and near the anterior extremity close to the mouth are two pairs of recurved curved hooks. The alimentary canal is a simple tube traversing the body from end to end, the anus opening at the extremity of its narrowed tail-like termination. The nervous system is represented by an anterior part or head ganglion connected with the paired posterior parts pass outwards to innervate the anterior extremity and backwards towards its posterior end. No respiratory or circulatory organs are known. The sexes are distinct but dissimilar in size, the female being usually much larger than the male. The generative organs occupy the large part of the body cavity. In the female the ovary is a large unpaired organ from the anterior end of which arise two oviducts, and connected with the latter are a pair of large so-called copulatory pouches, which perhaps act as receptacula seminis. These and the oviducts lie on the anterior half of the body; but the oviducts themselves soon unite to form a single tube of great length, which runs backwards to its posterior extremity, terminating in the genital orifice close to the anus.
In the male, on the contrary, this orifice is situated in the anterior half of the body, not far behind the mouth. The orifice leads into a large pouch lodging a pair of very long penes, which are coiled up when not in use. The two testiciles, which extend far back into the posterior part of the body, are long and tubular. Anteriorly their vasa deferentia soon unite into a common duct, which opens into the pouch containing the penes. Also communicating with this pouch is a pair of long slender flagelliform tubes, of which the function is unknown.

The structure of the adult Linguatula or Pentastomum, above described, does not supply convincing evidence of relationship with the Acari. At the same time some Acari, like Eriophyes (Phytopus) and Demodex, have the body elongated and annulated, but in these groups the elongation of the body is caudal or post-anal, as is attested by the position of the anus far forwards on its ventral surface. Again, the adult Pentastomum shows no trace of appendages, unless the two pairs of chitinous books are to be regarded as the vestiges of jaws or ambulatory limbs. In the embryo, however, what have been regarded as remnants of limbs may be seen.

In the mature stage Pentastomida live in the respiratory passages of mammals, principally in the nasal cavities. The remarkable life-history of one species, Linguatula taenioides, has been worked out in detail and presents a close analogy to that of some Cestodes. The adults live in the nose of dogs, where they have been known to survive over fifteen months. Each female lays a vast number of eggs, about 500,000 being the estimated amount. These are expelled along with mucus by the sneezing of the host. If they fall on pasture land or fodder of any kind and are eaten by any herbivorous animal, such as a hare, rabbit, horse, sheep or ox, the active embryos or larvae are set free in the alimentary canal of the new host.

![Fig. 1.—Linguatula taenioides. Ruld. adult.](image1)

![Fig. 2.—The same, in the first larval stage; under side. a . . a . . a . . Leg-like processes.](image2)

These larvae are minute oval creatures with a comparatively short apically fringed caudal prolongation and furnished with two pairs of short two-clawed processes, which may represent the limbs of arthropods and possibly the two pairs of legs found in Acari of the family Eriophyidae. The larva is also armed anteriorly with a median piercing proboscis and a pair of sharp hooks by means of which it perforates the walls of the alimentary tract and makes its way into the body cavity, lungs or liver. Here it becomes encysted, and loosing its boring apparatus and claw-bearing processes remains for a time quiescent. After a series of moults it passes in the second larval stage, somewhat like the parent but differing in having each integumental ring armed with a fringe of backwardly directed short bristles. This sexually immature stage, regarded at one time as representing a distinct species and named Linguatula denticulata, is reached in about six or seven months and measures from 6 to 8 mm. in length. In the event of the host escaping being killed and eaten it is believed that some of these larvae wander about or ultimately make their way to the exterior, possibly through the bronchi; nevertheless it seems to be certain that they can only reach sexual maturity in the nasal passages of some carnivorous animal, and the chance of attaining this environment is afforded when the viscer of the host are devoured by some flesh-eating mammal.

The adult female of Linguatula taenioides measures about 4 in. long and the male barely one-fourth of that. The adult and immature stages are, however, by no means confined respectively to carnivorous and herbivorous species of mammals. The adult stage, for example, has been found in the nasal passages of sheep, goats, horses and even of man, and the larval stage in the pleural and peritoneal cavities of dogs and cats.

**PENTATEUCH.**

Pentateuch, the name found as early as in Tertullian and Origen corresponding to the Jewish מַסֵּע (the five-fifths of the Torah, or Law), and applied to the first five books of the Old Testament (Genesis, Exodus, Leviticus, Numbers, Deuteronomy). The several books were named by the Jews from their initial words, though at least Leviticus, Numbers, and Deuteronomy had also titles resembling those we use, viz., זְבַע (זְבַע תַּבָּן), לֵוֶיתָן (לֵוֶיתָן תַּבָּן), and דֶּבֶרֶן. The Pentateuch, together with Joshua, Judges and Ruth, with which it is usually united in Greek MSS., makes up the Octateuch; the Pentateuch and Joshua together have recently been named the Hexateuch. On the critical questions arising from the Pentateuch or Hexateuch, see Bible and the articles on the several books.

**PENTECOST,** a feast of the Jews, in its original meaning a “harvest feast,” as consisting of the first-fruits of human toll (Exod. xxiii. 16), extending over the seven weeks which fairly correspond with the duration of the Canaanite harvest. Hence it was the closing feast of the harvest gladness.

The agricultural character of this feast clearly reveals its Canaanite origin (see Hebrew Religions). It does not, however, rank equal in importance with the other two agricultural festivals of pre-exilian Israel, viz. the Yom ha-tishri or feast of unleavened cakes (which marked the beginning of the corn-harvest), and the "Ingathering," later called Succoth, “booths” which marked the close of all the year’s ingathering of vegetable products. This is clear in the ideal scheme of Ezekiel (xliv. 21 seq.) in which according to the original text, Pentecost is omitted (see Cornill’s revised text and his note ad loc.). It is a later hand that has inscribed a reference to the “feast of weeks” which is found in our Massoretic Hebrew text. Nevertheless occasional allusions to this feast, though secondary, are to be found in Hebrew literature, e.g. Isa. ix. 3 (2 Heb.) and Ps. iv. 7 (8 Heb.).

In both the early codes, viz. in Exod. xxiii. 16 (E) and in Exod. xxxiv 22 (J, in which the harvest festival is called “feast of weeks”) we have only a bare statement that the harvest festival took place some weeks after the opening spring festival called Massoth. It is in Deut. xvi. 9 that we find it explicitly stated that seven weeks elapsed between the beginning of the corn-harvest ("when thou puttest the sickle to the corn") and the celebration of the harvest festival (קָנָן). We also note the same generous inclusion of the household slaves and of the resident alien well in the catalogue, and, in a slumberous and widow that characterizes the autumnal festival of "Booths.”

But when we pass to the post-exilian legislation (Lev. xxiii. 10–21; cf. Num. xxviii. 26 seq.) we enter upon a far more detailed and specific series of ritual instructions. (1) A special ceremonial is described as taking place on “the morrow after the Sabbath,” i.e. in the week of unleavened cakes. The first-fruits of the harvest here take the form of a sheaf which is waved by the priest before Yahweh. (2) There is the offering of a male lamb of the first year without blemish and also a meal offering of fine flour and oil mixed in defined proportions as well as a drink-offering of wine of a certain measure. After this “morrow after the Sabbath” seven weeks are to be reckoned, and when we reach the morrow after the seventh Sabbath fifty days have been enumerated. Here we must bear in mind that Hebrew numeration always includes the day which is the terminus a quo as well as that which is terminus a quo. On this fiftyth day two wave-loaves made from the produce of the fields occupied by the worshipper (“your habitation”) are offered together with seven unblemished lambs of the first year as well as one bullock and two rams as a burnt offering. We have further prescribed respecting the offering and the peace-offerings which were also presented. This elaborate ceremonial connected with the wave-offering (developed in the post-exilic period) took place on the morrow of the seventh Sabbath called

---

1. On the critical questions involved in these ritual details of Lev. xxiii. 16 seq. compared with Num. xxviii. 27–30 cf. Driver and White in B. O. T., note on Lev. xxiii. 18.
a “day of holy convocation” on which no servile work was to be done. It was called a “fiftieth-day feast.” Pentecost or “Fiftieth” day is only a Greek equivalent of the last name (τετάρτανην) in the Apocalypse and New Testament. The orthodox later Jews reckoned the fifty days from the 16th of Nisan, but on this there has been considerable controversy among Jews themselves. The orthodox later Jews assumed that the Sabbath in Lev. xxiii. 11, 15 is the 15th Nisan, or the first day of the feast of Passover. Hitzig maintained that in the Hebrew calendar 14th and 21st Nisan were always Sabbaths, and that 1st Nisan was always a Sunday, which was the opening day of the year. “The morrow after the Sabbath” means, according to Hitzig, the day after the weekly Sabbath, viz. 22nd Nisan. Knobel (Comment. on Leviticus) and Kurtz agree with Hitzig’s premises but differ from his identification of the Sabbath. They identify it with the 14th Nisan. Accordingly the “day after falls on the 15th. (See Purves’s article, “Pentecost,” in Hastings’s Dict. of the Bible, and also Ginsberg’s article in Kitto’s Cyclopaedia). Like the other great feasts, it came to be celebrated by fixed special sacrifices. The amount of these is differently expressed in the earlier and later priestly law (Lev. xxiii. 18 seq.; Num. xxviii. 26 seq.); the discrepancy was met by adding the two lists. The later Jews also extended the one day of the feast to two. Further, in accordance with the tendency to substitute historical for economic explanations of the great feasts, Pentecost came to be regarded as the feast commemorative of the Sinaic legislation.

To the Christian Church Pentecost acquired a new significance through the outpouring of the Spirit (Acts ii.). (See Whit-Sunday.)

It is not easy to find definite parallels to this festival in other ancient religious cults. The Akedah festival to Marduk was a spring festival at the beginning of the Babylonian year (Nisan). It therefore comes near in time to the feast of unleavened cakes, rather than to the later harvest festival in the month Sivan called “feast of weeks.” Zimmern indeed connects the Akedah festival with that of Purim on the 13th Adar (March); see K. A. T. 3 p. 514 seq. Also the Roman Cerealia of April 12th-19th rather correspond to Mazzoth than to Kasir. (O. C. W.)

PENTELICUS (Βραχόρροος, or Πεντελικὸν ὅρος from the deme Πεντέλη; mod. Mendell), a mountain to the N.E. of the Athenian plain, height 3640 ft. Its quarries of white marble were not regularly worked until after the Persian wars; of this material all the chief buildings of Athens were constructed, as well as the sculpture with which they were ornamented. The ancient quarries are mostly on the south side of the mountain. The best modern quarries are on the north side. The top of Pentelicus commands a view over the plain of Marathon, and from it the Athenian traitors gave the signal to the Persians by a flashing shield on the day of the battle. There was a statue of Athena on the mountain.

PENTHEUS, in Greek legend, successor of Cadmus as king of Thebes. When Dionysus, with his band of frenzied women (Maenads) arrived at Thebes (his native place and the first city visited by him in Greece), Pentheus denied his divinity and violently opposed the introduction of his rites. His mother Agave having joined the revellers on Mount Cithaeron, Pentheus followed and climbed a lofty pine to watch the proceedings. Being discovered he was torn to pieces by Agave and others, who mistook him for some wild beast. His head was carried back to Thebes in triumph by his mother. Labdacus and Lycurgus, who offered a similar resistance, met with a like fearful end. Some identify Pentheus with Dionysus himself in his character as the god of the vine, torn to pieces by the violence of winter. The fate of Pentheus was the subject of lost tragedies by Thespis and Pacuvius.

See Euripides, Bacchae, passim; Ovid, Metam. iii. 513; Theocritus xxvi; Apollodorus iii. 21; Nonnus, Dionysiaca, xlv-xlvii; on representations in art see O. Jahn, Penthes and die Maimaden (1841).

PENTHEIÈRE, COUNTS OF. In the 11th and 12th centuries the countship of Penthièvre in Brittany (dep. of Côtes-du-Nord) belonged to a branch of the sovereign house of Brittany. Henry d’Avaugour, heir of this dynasty, was dispossessed of the countship in 1253 by the duke of Brittany, Pierre Maulec, who gave it as dowry to his daughter, Yolande, on her marriage in 1258 to Hugh of Lusignan, count of La Marche. Duke John I of Brittany, Yolande’s brother, seized the countship in 1272. In 1337 Joan of Brittany brought Penthièvre to her husband, Charles de Châtillon-Blois. In 1437 Nicole de Blois, a descendant of this family, married Jean de Brosse, and was deprived of Penthièvre by the duke of Brittany, Francis II., in 1455. The countship, which was restored to Sebastian of Luxemburg, heir of the Brosses through his mother, was erected for him into a duchy in the peerage of France (ducze-prieur) in 1569, and was afterwards held by the duchess of Mercœur, daughter of the first duke of Penthièvre, and then by her daughter, the duchess of Vendôme. The dukes of Vendôme’s grandson, Louis Joseph, inherited Penthièvre in 1669, but it was taken from him by decree in 1687 and adjudged to Anne Marie de Bourbon, princess of Conti. In 1696 it was sold to the count of Toulouse, whose son bore the title of duke of Penthièvre. This title passed by inheritance to the house of Orleans.

PENTHOUSE, a sloping roof attached to a building either to serve as a porch or a covering for an arcade, or, if supported by walls, as a “lean-to.” In the history of siegework, the word is particularly applied to the fixed or movable constructions used to protect the besiegers when mining, working battering-rams, catapults, &c., and is thus used to translate Lat. sinca and pilatus, and also testudo, the shelter of locked shields of the Romans. The Mid. Eng. form of the word is pentis, an adaptation of O. Fr. a pentis, Med. Lat. appendicium or appendicium, a small structure attached to, or dependent on, another building, from appendere, to hang on to. The form “pent-house” is due to a supposed connection with “house” and Fr. pente, sloping roof. The more correct form “pentine” is now frequently used.

PENTSTEMON, in botany, a genus of plants (nat. order Scrophulariaceae), chiefly natives of North America, with showy open-tubular flowers. The pentstemon of the florist has, however, sprung from P. Hartwegii and P. Cobaea, and possibly some others. The plants endure English winters unharmed in favoured situations. They are freely multiplied by cuttings, selected from the young side shoots, planted early in September, and kept in a close cold frame till rooted. They winter safely in cold frames, protected by mats or litter during frost. They produce seed freely, new kinds being obtained by that means. When special varieties are not required true from cuttings, the simplest way to raise pentstemons is to sow seed in hotbeds in rainy weather, afterwards prick off the seedlings out and hardening them off, so as to be ready for the open air by the end of May. Plants formerly known under the name of Chelone (e.g. C. barbata, C. campylanda) are now classed with the pentstemons.

PENUMBRA (Lat. paene, almost, umbra, a shadow), in astronomy, the partial shadow of a heavenly body as cast by the sun. It is defined by the region in which the light of the sun is partially but not wholly cut off through the interception of a dark body. (See Eclipse.)

PENZA, a government of eastern Russia, bounded N. by the government of Nizhni-Novgorod, E. by Simbirsk, and S. and W. by Saratow and Tambov; area 14,992 sq. m.; pop. (est. 1906) 1,090,000. The surface is undulating, with deep valleys and ravines, but does not exceed 900 ft. above sea-level. It is principally made up of Cretaceous sandstones, sands, marls, and clay, covered in the east by Kornev depots (Chalk), and almost entirely covered by clefts, which are the chief mineral products in the north. The soil is a black earth, more or less mixed with clay and sand; marshes occur in the Krasnoslobodsk district; and expanses of sand in the river valleys. There are extensive forests in the north, but the south exhibits the characteristic features of a steppeland. The government is drained by the Moksha, the Sura (both navigable), and the Khoper, belonging to the Oka, Volga and Don systems. Timber is floated down
several smaller streams, while the Moksha and Sura are important means of conveyance. The climate is harsh, the average temperature at the city of Penza being only 38°. The population consists principally of Russians, together with Mordvinians, Meshcheryaks and Tatars. The Russians profess the Orthodox Greek faith, and very many, especially in the north, are Raskolniks or Nonconformists. The chief occupation is agriculture. The principal crops are rye, oats, buckwheat, hemp, potatoes and beetroot. Grain and flour are considerable exports. The local authorities have established dépôts for the sale of modern agricultural machinery. There are several agricultural and horticultural schools, and two model dairy-farms. Cattle breeding and especially horse-breeding are comparatively flourishing. Market-gardening is successfully carried on, and improved varieties of fruit-trees have been introduced through the imperial botanical garden at Penza and a private school of gardening in the Gorodishche district. Sheep-breeding is especially developed in Chembar and Insar. The Mordvinians devote much attention to bee-keeping. The forests (25% of the total area) are a considerable source of wealth, especially in Krasnoslobodsk and Gorodishche. The manufactures are few. Distilleries come first, followed by beet sugar and oil mills, with woollen cloth and paper mills, tanneries, soap, glass, machinery and iron-works. Trade is limited to the export of corn, spirits, timber, hempseed-oil, tallow, hides, honey, wax, woolen cloth and paper mills, tanneries, soap, glass, machinery and iron-works.

PENZA—PEONAGE

The government is divided into ten districts, the chief towns of which are Penza, Gorodishche, Insar, Kerensk, Krasnoslobodsk, Mokshany, Narovchat, Nizhni-Lomov, Sarsansk and Chembar. The present government of Penza was formerly inhabited by Mordvinians, who had the Meshcheryaks on the W. and the Bulgars on the N. In the 13th century these populations fell under the dominion of the Tatars, with whom they fought against Moscow. The Russians founded the town of Mokshany in 1535. Penza was founded in the beginning of the 17th century, the permanent Russian settlement dating as far back as 1666. In 1776 it was taken by the rebel Pugachev. The town was almost totally destroyed by conflagrations in 1836, 1839 and 1853.

PENZA, a town of Russia, capital of the government of the same name, 402 m. by rail S.E. from Moscow. It stands on a plateau 567 ft. above the sea, at the confluence of the Penza with the navigable Sura. Pop. (1897), 61,851. The older parts of the town are constructed of wood, but the newer parts are well built. The cathedral was erected in 1820-1821. Penza has technical schools, public libraries, a museum of antiquities, and a theatre which has played some part in the history of the Russian stage. The bulk of the inhabitants support themselves by agriculture or fishing in the Sura. An imperial botanical garden is situated within two miles of the town. Apart from paper-mills and steam flour-mills, the manufacturing establishments are small. There is a trade in corn, oil, tallow, timber and spirits, and two fairs where cattle and horses are sold.

PEONAGE, a municipal borough, market town and seaport in the St Ives parliamentary division of Cornwall, England, the terminus of the Great Western railway, 325 m. W.S.W. of London. Pop. (1901), 13,156. It is finely situated on the western shore of Mount's Bay, opposite St Michael's Mount, being the westernmost port in England. The site of the old town slopes sharply upward from the harbour, to the west of which there extends an esplanade and modern residential quarter; for Penzance, with its mild climate, is in considerable favour as a health resort. The town has no buildings of great antiquity, but the public buildings (1867), in Italian style, are handsome. By the market house is a statue of Sir Humphry Davy, who was born here in 1778. Among institutions there are a specially fine public library, museums of geology and natural history and antiquities, mining and science schools, the West Cornwall Infirmary and a meteorological station. The harbour, enclosed within a breakwater, has an area of 24 acres, with 12 to 16 ft. depth of water, and floating and grazing docks. There is a large export trade in fish, including that of pilchards to Italy. Other exports are tin and copper, granite, serpentine, vegetables and china clay. Imports are principally coal, iron and timber. Great quantities of early potatoes and vegetables, together with flowers and fish, are sent to London and elsewhere. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 355 acres.

Nearly two miles inland to the north-west is MADRON (an urban district with a population of 3486). The church of St Maddern is principally Perpendicular, with earlier portions and a Norman front. Near the village is a “wishing well” of ancient fame is seen, and close to it the ruins of a baptistery of extreme antiquity. Monoliths and cromlechs are not uncommon in the neighbourhood. Three miles north-east is the urban district of LUDGVAN (pop. 2274), and to the south is PAUL (6332), which includes the village of Newlyn (q.v.).

Penzance. (Penzans) was not recognized as a port until the days of the Tudors, but its importance as a fishing village dates from the 14th century. In 1327 thirty barges in Penzance and thirteen boats paying 13s. yearly are found among the possessions of the bishops of St. Albans, but which name it formed a portion of the demesne lands. The year 1512 marks the beginning of a new era. Until then St Michael's Mount had been regarded as the port of Mounts Bay; but in that year Henry VIII. granted the tenancies of Penzance whatever profits might accrue from the “ankerage, kylage and busselage” of ships resorting thither, so long as they should repair and maintain the quay and bulwarks for the safeguard of the ships and town. Nevertheless thirty years later it is described by Leland as the westernmost market town in Cornwall “with no socr for Botes or shippes but a forced Pere or Key.” During the war with Spain the town was devastated in 1595. The charter of incorporation granted in 1614 states that by the invasion of the Spaniards it had been treacherously spoiled and burnt but that its strength, prosperity and usefulness for navigation, and the acceptable and laudable services of the inhabitants in rebuilding and fortifying it, and their enterprise in erecting a pier, have moved the king to grant the petition for its incorporation. This charter provides for a mayor, eight aldermen and twelve assistants to constitute the common council, the mayor to be chosen by the council from the aldermen, the aldermen to be chosen from the assistants, and the assistants from the most efficient and discreet of the inhabitants. It also ratified Henry's grant of anchorage, keelage and busselage. In 1683 Penzance was constituted a coinage town for tin. It has never enjoyed independent parliamentary representation. In 1322 a market on Wednesdays and a fair at the Feast of St Peter at Vincula were granted to Alice de Lisle and in 1495 this market was ratified and three additional fairs added, viz. at the feasts of St Peter in Cathedral and the Conception and Nativity of the Blessed Virgin. The charter of 1614 substituted markets on Tuesdays and Thursdays for the Wednesday market and added two fairs one at Corpus Christi and the other on the Thursday before St Andrew. Of the fairs only Corpus Christi remains; markets are now held on Tuesday, Thursday and Saturday. Apart from fishing and shipping, Penzance has never been an industrial centre.

PEONAGE (Span. peon; M.L. pedo [pes], primarily a footsoldier, then a day-labourer), a system of agricultural servitude common in Spanish America, particularly in Mexico. In the early days the Spanish government, with the idea of protecting the Indians, exempted them from compulsory military service, the payment of tithes and other taxes, and regulated the system of labour; but left them practically at the mercy of the Spanish governors. The peons, as the Indian labourers were called, were of two kinds: (1) the agricultural workman who was free to contract himself, and (2) the criminal labourers who, for slight offences, or more usually for debt, were condemned to practical slavery. Though legally peonage is abolished, the unfortunate peon is often lured into debt by his employer and then kept a slave, the law permitting his forcible detention till he has paid his debt to his master.
PEOPLE—PEPE

PEOPLE, a collective term for persons in general, especially as forming the body of persons in a community or nation, the "folk" (the O.E. and Teut. word, cf. Ger. Volk). The earlier forms of the word were pepel, peple, people, and the present form is found as early as the 15th century, but was not established till the beginning of the 16th. Old French, from which it was adapted, had many of these forms as well as the mod. Fr. peuple. The Lat. populus is generally taken to be a reduplication from the root ple,—fill, seen in plenus, full; plebs, the commons; Gr. ἄνθρωπος, multitude.

PEORIA, a city, port of entry, and the county-seat of Peoria county, Illinois, U.S.A., in the north central part of the state, on the lower end of Lake Peoria, an expansion of the Illinois river, and about 150 m. S.W. of Chicago. Pop. (1900) 56,100; (1910) 66,950. It is served by 13 railways, of which the most important are the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Chicago & Alton, the Illinois Central, the Cleveland, Cincinnati, Chicago & St Louis, and the Chicago & North-Western. The Illinois river is navigable to its mouth, and at La Salle, above Peoria, connects with the Illinois & Michigan Canal extending to Chicago. The river is spanned at Peoria by two railway bridges and a wagon bridge. The residential portion of the city is situated on bluffs overlooking Lake Peoria, and the business streets lie on the plain between these elevations and the water front. The park system includes more than 400 acres; Bradley Park (140 acres), the largest, was given to the city by Mrs Lydia Moss Bradley (1816-1908) and was named in her honour. On a bluff north-east of the city is Glen Oak Park (103 acres), modelled after Forest Park, St Louis, Missouri; in the south-western part of the city is Madison Park (88 acres); and in the lower part of the city is South Park (10 acres). In the Court House Square there are two monuments in honour of the Federal soldiers and sailors of Peoria county who perished in the Civil War; in Springdale Cemetery there are two similar memorials, one of which (a large granite boulder) is in memory of the unknown dead; and in the same cemetery there is a monument erected by the state (1906) to mark the grave of Thomas Foid (d. 1851), governor of Illinois in 1842-1846. Among the principal public buildings and institutions are the Peoria Public Library founded in 1855, the City Hall, the Court House, the Federal building, St Mary's Cathedral, the Bradley Polytechnic Institute (affiliated with the university of Chicago), founded in 1856 by Mrs Lydia Moss Bradley, who gave it an endowment of $5,000,000; Spalding Institute, founded through the efforts of John L. Spalding (b. 1840, who was Bishop of the Roman Catholic diocese of Peoria in 1857-1898), an Evangelical Lutheran Orphan Home, and Industrial School for girls (1852), Calvert Hospital (1876), St Francis Hospital (1875), a Florence Crittenton Home (1902), a Home for the Friendless (1876), and a House of the Good Shepherd (1801), and the Guier Memorial (1880), St Joseph's (1892), and John C. Proctor homes for the aged and infirm (1907). At Bartonville, a suburb, there is a state hospital for the incurable insane.

In 1800 and in 1905 Peoria ranked second among the cities of Illinois in the value of its manufactures. The invested capital amounted in 1805 to $22,243,821, and the factory products were valued at $60,920,411. The principal industry is the manufacture of distilled liquors, which were valued in 1905 at $42,170,815. Other important manufactures are agricultural implements ($2,300,000), slaughter-house and meat-packing products ($1,480,398), glucose, cooperage ($1,287,742), malt liquors ($88,570), foundry and machine-shop products, strawboard, automobiles, brick and stone, and flour and gist mill products. Peoria is also an important shipping point for grain and coal.

Peoria was named from one of the five tribes of the Illinois Indians. In 1860 La Salle, the explorer, built Fort Crévecœur, on the lake shore bluffs, opposite the present city; this fort, however, was destroyed and deserted in the same year by La Salle's followers after he had set out to return to Fort Frontenac. There is evidence that a French mission was established on or near the site of Peoria as early as 1711; and certainly by 1725 a settlement, known as Peoria, and composed of French and "breed" traders, trappers and farmers, had been established about 13 m. above the foot of the lake, on its west shore. This village was practically deserted during the later years (1781-1783) of the War of Independence, and when its inhabitants returned after the peace they settled in a village which had been established about 1778, on the present site of Peoria, by Jean Baptiste Maillé (d. 1801), and was at first called La Ville de Maillé. It is probable that Jean Baptiste Point de Sable, believed to have been a Santo Domingan negro, and jocularly spoken of as "the first white settler in Chicago," lived in the "old village" of Peoria as early as 1773—or six years before he settled on the present site of Chicago—and again about 1783. In November 1812 about half of the town was burned by a company of Illinois militia who had been sent thither to build a fort, and whose captain asserted that his boats had been fired upon at night by the villagers. In the following year a fort, named Fort Clark in honour of George Rogers Clark, was erected on the site of the old village; it was evacuated in 1818, and soon afterwards was burned by the Indians. After the town was burned there was no serious attempt to rebuild until 1819. Peoria was incorporated as a town in 1835 and was chartered as a city in 1845. In 1850 Peoria was annexed.

See David McCulloch, Early Days of Peoria and Chicago, an address read before the Chicago Historical Society in 1904, and published by that society, (n.d.), and "Old Peoria," by the same author, Peoria City and County, Ill., 1875; also Chicago and Northwestern Transactions (Springfield, III. 1861); also Historical Encyclopaedia of Illinois (Chicago, 1896), ed. by Newton Bateman and Paul Selby; History of Peoria County, Ill. (Chicago, 1880); and C. Ballance, History of Peoria (Peoria, 1870).

PEPE, GUGLIELMO (1783-1853), Neapolitan general, was born at Squillace in Calabria. He entered the army at an early age, but in 1799 he took part in the republican movement at Naples inspired by the French Revolution; he fought against the Bourbon troops under Cardinal Ruffo, was captured and exiled to France. He entered Napoleon's army and served with distinction in several campaigns, including those in the Neapolitan kingdom, first under Joseph Bonaparte and later under Joachim Murat. After commanding a Neapolitan brigade in the Peninsular campaign, Pepe returned to Italy in 1813, with the rank of general, to help to reorganize the Neapolitan army. When the news of the fall of Napoleon (1814) reached Italy Pepe and several other generals tried without success to force Murat to grant a constitution as the only means of saving the kingdom from foreign invasion and the return of the Bourbons. On Napoleon's escape from Elba (1815) Murat, after some hesitation, placed himself on the emperor's side and waged war against the Austrians, with Pepe on his staff. After several engagements the Neapolitans were forced to retire; and finally agreed to the treaty of Casalanza by which Murat was to abandon the kingdom; but the Neapolitan officers retained their rank under Ferdinand IV, who now regained the throne of Naples. While engaged in suppressing brigandage in the Capitanata, Pepe organized the carbonari (q.v.) into a national militia, and was preparing to use them for political purposes. He had hoped that the king would end by granting a constitution, but when that hope failed he meditated seizing Ferdinand, the emperor of Austria, and Metternich, who were expected at Avellino, and thus compelling them to liberate Italy (1819). The scheme broke down through an accident, but in the following year a military rising broke out, the mutineers cheering for the king and the constitution. Pepe himself was sent against them, but while he was hesitating as to what course he should follow Ferdinand engaged his troops. A revolt in Sicily having been repressed, Pepe was appointed inspector-general of the army. In the meanwhile the king, who had no intention of respecting the constitution, went to Laibach to confer with the sovereigns of the holy alliance assembled there, leaving his son as regent. He obtained the loan of an Austrian army with which to restore absolute power, while the regent dallied with the Liberals. Pepe, who in parliament had declared in favour of deposing the king, now took command of the army and marched against the Austrians. He attacked them at Rieti (March 7,
127

PEPERINO—PEPPER

1821), but his raw levis were repulsed. The army was gradually dishandled, and Pepe spent several years in England, France and other countries, publishing a number of books and pamphlets of a political character and keeping up his connexion with the Carbonari. When in 1838 revolution and war broke out all over Italy, Pepe returned to Naples, where a constitution had again been proclaimed. He was given command of the Neapolitan army which was to co-operate with Piedmont against the Austrians, but when he reached Bologna the king, who had already changed his mind, recalled him and his troops. Pepe, after hesitating between his desire to fight for Italy, and his oath to the king, resigned his commission in the Neapolitan service and crossed the Po with 2000 volunteers to take part in the campaign. After a good deal of fighting in Venetia, he joined Manin in Venice and took command of the defending army. When the city was forced by hunger to surrender to the Austrians, Pepe and Manin were among those excluded from the amnesty; he again went into exile and died in Turin in 1855.

The story of Pepe's life down to 1846 is told in his own interesting Memoire (Lugano, 1847), and his Narrative of the Events... at Naples in 1820 and 1821 (London, 1821): for the later period of his life see the general histories of the Risorgimento, and the biographical sketch in vol. ii. of L. Carpi's Risorgimento (Milan, 1836).

PEPERINO, an Italian name applied to a brown or grey volcanic tuff, containing fragments of basalt and limestone, with disseminated crystals of augite, mica, magnetite, leucite, &e. The typical peperino occurs in the Alban Hills, near Rome, and was used by the ancients, under the name of lapis albus, as a building stone and for the basins of fountains. Other tufts and conglomerates in Avuerigne and elsewhere are also called peperino. The name originally referred to the dark coloured inclusions, suggestive of pepper-corns. In English the word has sometimes been written peperine.

PEPPER, WILLIAM (1843–1898), American physician, was born in Philadelphia, on the 21st of August 1843. He was educated at the university of Pennsylvania, graduating from the academic department in 1862 and from the medical department in 1864. In 1868 he became lecturer on morbid anatomy in the same institution, and in 1870 lecturer on clinical medicine. From 1876 to 1887 he was professor of clinical medicine, and in 1887 succeeded Dr Alfred Stillé as professor of theory and practice of medicine. He was elected provost of the university in 1881, resigning that position in 1894. For his services as medical director of the Centennial Exhibition in 1876 he was made knight commander of St Olaf by the king of Sweden. He founded the Philadelphia Medical Times, and was editor of the journal in 1878. Peperino was known particularly for his contributions on the subject of the theory and practice of medicine, and the System of Medicine which he edited in 1885–1886 became one of the standard textbooks in America. Among his contributions to the medical and scientific journals of the day, were: "Trephining in Cerebral Disease" (1871); "Local Treatment in Pulmonary Cavities" (1874); "Cataarrhal Irrigation" (1881); "Epilepsy" (1883); and "Higher Medical Education: The True Interest of the Public and the Profession." He died on the 28th of July 1888 at Pleasanton, California.

PEPPER, a name applied to several pungent spices known respectively as black, white, red, or cayenne, Ashanti, Jamaica, and melequeta pepper, but derived from at least three different natural orders of plants.

Black pepper is the dried fruit of piper nigrum, a perennial climbing shrub indigenous to the forests of Trancanore and Malabar, from whence it has been introduced into Java, Sumatra, Borneo, the Malay Peninsula, Siam, the Philippines, and the West Indies. It climbs on tree-trunks by roots in the same way as ivy, and from its climbing habit is known as the pepper vine. It is one of the earliest spices known to mankind, and for many ages formed a staple article of commerce between India and Europe. Tribute has been levied in pepper; one of the articles demanded in 408 by Alaric as part of the ransom of Rome was 3000 lb of pepper. Its exorbitant price during the middle ages was one of the inducements which led the Portuguese to seek a sea-route to India. The discovery of the passage round the Cape of Good Hope led (1498) to a considerable fall in the price, and about the same time the cultivation of the plant was extended to the western islands of the Malay Archipelago. Pepper, however, remained a monopoly of the Portuguese crown as late as the 18th century. In Great Britain it was formerly taxed very heavily, the impost in 1623 amounting to 5s., and as late as 1823 to 2s. 6d. lb.

The largest quantities of pepper are produced in Penang, the island of Riouw, and Johore near Singapore—Penang affording on an average about half of the entire crop. Singapore is the great emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. The varieties of black pepper met with in commerce are known as Malabar, Aleppy or Tellicherry, Cochlin, Penang, Singapore and Slam.

Piper nigrum.

a. Twig with fruit (about 1/2 nat. size); b. longitudinal section of flower much enlarged; c. section of fruit.

It owes its pungency to a resin, and its flavour to a volatile oil, of which it yields from 1-6 to 2-2%. The oil agrees with oil of turpentine in composition as well as in specific gravity and boiling point. In polarized light it deviates the ray, in a column 50 mm. long, 1-2° to 3-4° to the left. Pepper also contains a yellow crystalline alkaloid, called piperine, to the extent of 2 to 8%. This substance has the same empirical formula as morphine, C12H15NO, but differs in constitution and properties. It is insoluble in water when pure, is devoid of colour, flavour and odour, and may be resolved into piperic acid, C12H10O2, and piperidine, C12H14N. The latter is a liquid colourless alkaloid, boiling at 100° C., has an odour of pepper and ammonia, and yields crystallizable salts. A fatty oil is found in the pericarp of pepper, and the berries yield on incineration from 4-1 to 5-7% of ash. The only use of black pepper is as a condiment, but it may be given therapeutically in doses of 5 to 20 grains. It has the pharmacological actions of a volatile oil.

In the south-west of India, where the pepper-plant grows wild, it is found in rich, moist, leafy soil, in narrow valleys, propagating itself by running along the ground and giving off roots into the soil. The only method of cultivation adopted by the natives is to tie up the end of the vines to the neighbouring trees at distances of at least 6 ft, especially to those having a rough bark, in order that the roots may easily attach themselves to the surface. The underwood is then cleared away, leaving only sufficient trees to provide shade and permit free ventilation. The roots are manured with a heap of leaves, and the shoots are trained twice a year. In localities where the pepper does not grow wild, ground is selected which permits of free drainage, but which is not too dry nor liable to inundation, and cuttings are planted at about a foot from the trees either in the rainy season in June or in the dry season in February. Sometimes several cuttings about 18 in. long are placed in a basket and buried at the root of the tree, the cuttings being made to slope towards the trunk. In October or November the young plants are manured with a mixture of leaves and cow-dung. On dry soils the young plants require watering every other day during the dry season for the first three years. The plants bear in the fourth or fifth year, and if raised from cuttings are
fruitful for **seven** years, 6 ft from seed for fourteen years. The pepper from plants raised from cuttings is said to be superior in quantity and quality, and this method is in consequence most frequently adopted. Where there are no trees the ground is made into terraces and enclosed by a mud wall, and branches of *Erythrina indica* are put into the ground in the rainy season and in the course of a year are capable of supporting the young pepper plants. In the meantime mango trees are planted, these being preferred as support to the pepper plant, while, the *Erythrina* is killed by it in fourteen or fifteen years.

In Sumatra the ground is cleared, ploughed, and sown with rice, and cuttings of the vine are planted in September, 5 ft apart each way, together with a crop of quick growth and rough bark. This rice is now left for twelve or eighteen months and then entirely buried, except a small piece of bent stem, whence new shoots arise, three or four of which are allowed to climb the tree near which they are planted. These shoots generally yield flowers and fruit the following year. Two crops are collected every year, the principal one being in December and January and the other in July and August, the latter yielding pepper of inferior quality and in less quantity.

Two or three varieties are met with in cultivation; that yielding the best kinds has broadly ovate leaves, five to seven in number, nervved and stalked. The flower-spikes are opposite the leaves, stalked and from 3 to 6 in. long; the flowers are sessile and fleshy. A single stem will bear from twenty to thirty of these spikes. The harvest begins as soon as one or two berries at the base of the spikes begin to turn red and, before the fruit is mature, but when full-grown and still hard; if allowed to ripen, the berries lose pungency, and the spikes are lost in the harvest. The fall of these fruits is lost in the bags or baskets and dried in the sun. When dry the pepper is put into bags containing from 64 to 128 lb. In Sumatra the yield is estimated at about 1 lb per plant per annum. In Malabar each village produces a large quantity, and on the borders of the Malabar coast, or about 24 lb from each tree, a single tree sometimes supplementing eight or twelve vines; an acre is calculated to bear 2500 plants, to cost about £4 in outlay to bring it into bearing, and to yield a produce of 600 when in its best condition.

**White pepper** differs only in being prepared from the ripe fruits. These, after collection, are kept in the house three days and then bruised and washed in a basket with the hand until the stalks and pulp matter are removed, after which the seeds are dried. It is, however, sometimes prepared from the dried black pepper by removing the dark outer layer. It is less pungent than the black but possesses a finer flavour. It is chiefly prepared at the island of Rioou, but the finest comes from Tellicherry.

White pepper affords on an average not more than 1.5% of essential oil; but, according to Cazenove, as much as 9% of piperine, and of ash not more than 1.1%.

**Long pepper** is the fruit-spike of *Piper officinarum* and *P. longum*, gathered shortly before it reaches maturity and dried. The former is a native of the Indian Archipelago, and has long-ovate sessile leaves, which are partly veined. The latter is indigenous in the hotter provinces of India, Ceylon, Malacca and the Malay Islands; it is distinguished from *P. officinarum* by the leaves being cordate at the base and five-veined.

Long pepper appears to have been known to the ancient Greeks and Romans under the name of *peperon maurus*; and in the 10th century mention is made of long pepper, or macropiper, in conjunction with black and white peppers. The spike consists of a dense spike of minute, obovate, flattened fruits closely packed around the central axis, the spike being about 1 1/2 in. long and 1 in. thick; as met with in commerce they have the appearance of being having lined. In Bengal the plants are cultivated by suckers, which are propagated on dry rich soil on high ground. An English acre will yield about 3 mounds (80 lb) the first year, 2 the second, and 18 the third year; after this time the yield decreases, and the roots are therefore grubbed up and sold as *pippal mad*, under which name they are much used as a medicine in India. After the fruit is collected, which is usually in January, the stem and leaves die down to the ground. Long pepper contains piperine, resin and volatile oil and yields about 8% of ash. Penang and Singapore are the principal centres in the East for its sale.

**Ashanii or West African pepper** is the dried fruit of *Piper Chusii*, a plant widely distributed in tropical Africa, occurring most abundantly in the country of the Niam-niams. It differs from the latter in being less pungent and in being attenuated into a stalk, like cubebes (the dried unripe fruits of *P. Cubeba*), to which it bears considerable resemblance externally. The taste, however, is pungent, exactly like that of pepper, and the fruit contains piperine. It was imported from the Grain Coast by the merchants of Rouen and Dieppe as early as 1364 and was exported from Benin by the Portuguese in 1485; but, according to Clusius, its importation was forbidden by the king of Portugal for fear it should depreciate the value of the pepper from India. In tropical Africa it is extensively used as a condiment, and it could easily be collected in large quantities if a demand for it should arise.

**Jamaica pepper** is the fruit of *Pimenta officinalis*, an evergreen tree of the Myrtle family. It is more correctly termed "pimento" or "allisipe", as it is not a true pepper.

**Melegueta pepper**, known also as "Guinea grains," "grains of paradise" (q.v.) or "alligator pepper," is the seed of *Amomum Melegueta*, a plant of the ginger family; the seeds are exceedingly pungent, and are used as a spice throughout central and northern Africa.

For Cayenne pepper, see that article.

**PEPPER-CORN**, the fruit or seed of the pepper plant; hence anything very small or insignificant. **Pepper-corn rent** is a merely nominal rent, reserved for the purpose of having the tenancy acknowledged by the tenant. Building leases frequently reserve a pepper-corn as rent for the first few years. See REENT.

**PEPPERMINT**, an indigenous perennial herb of the natural order Labiatae, and genus *Mentha* (see Mint), the specific name being *Mentha piperita*, is distinguished from other species of the genus by its stalked leaves and oblong-obtuse spike-like heads of flowers. It is met with, near streams and in wet places, in several parts of England and on the European continent, and is also extensively cultivated for the sake of its essential oil in England, in several parts of continental Europe, and in the

United States. Yet it was only recognized as a distinct species late in the 17th century, when Dr Eales discovered it in Hertfordshire and pointed it out to Ray, who published it in the second edition of his *Synopsis stirpium britannicarum* (1695). The medicinal properties of the plant were speedily recognized and it was admitted into the *London Pharmacopoeia* in 1721, under the name of *Mentha piperitae sapore.*

Two varieties are recognized by growers, the white and the black mint. The former has purplish and the latter green stems; the leaves are more coarsely serrated in the white. The black is more generally cultivated, probably because it is found to yield more oil, but that of the white variety is considered to have more delicate odour, and obtains a higher price. The white is the kind chiefly dried for hebalists. The flavour varies to a slight extent even with particular plots of land, badly drained ground being known to give unfavourable results both as to the quantity and quality of the oil. That of the Japanese

1 Near Mitcham in Surrey, Wisbech in Cambridgeshire, Market Deeping in Lincolnshire and Hitchin in Hertfordshire.
and Chinese oil also differs slightly from the English, and is thus distinguishable by experts. In America the oil is liable to be injured in flavour by aromatic weeds which grow freely among the crop, the most troublesome of these being Erigeron canadensis, and Erechtites hieracifolia. When pure the oil is nearly colourless and has an agreeable odour and powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. It has a specific gravity of 0.84 to 0.92, and boils at 365° F. Mitcham oil, when examined by polarized light in a column 50 mm. long, deviates from 14.2° to 10.7° to the left, the American 4.3°. When oil of peppermint is cooled to 4° C. it sometimes deposits colourless hexagonal prisms of menthol, C₇H₆O₂, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92° F. The oil consists chiefly of menthol and a terpene called menthene, C₇H₈. Oil of peppermint is often adulterated with a third part of rectified spirit, which may be detected by the milkiness produced when the oil is agitated with water. Oil of rosemary and rectified oil of turpentine are sometimes used for the same purpose. If the oil contains turpentine it will explode with iodine. If quite pure it dissolves in its own weight of rectified spirits of wine. Peppermint oil is largely distilled at Canton, a considerable quantity being sent to Bombay, also a large quantity of menthol. The species cultivated in the neighbourhood of Canton, is Mentha arvensis, var. globata. Peppermint is chiefly cultivated in the province of Kiang-si; and according to native statements as much as 40 piculs of oil of peppermint are sent annually to ports on the coast. In Japan also the distillation of oil of peppermint forms a considerable industry, the plant cultivated being M. arvensis, var. piperascens. The oil, under the name of hakka no abura, is exported from Hiogo and Ozaka, but is said to be frequently adulterated. The menthol is obtained by subjecting the oil to a low temperature, when it crystallizes out and is separated. The two varieties of M. arvensis just named yield much more menthol than M. piperita. It is remarkable, however, that in North-West America, growing in Ceylon, has not the flavour of peppermint but that of garden mint, while typical form of M. arvensis grown in Great Britain has an odour so different from peppermint that it has to be carefully removed from the field lest it should spoil the flavour of the peppermint oil when the herb is distilled. M. incana, cultivated near Bombay as a herb, also possesses the flavour of peppermint. In the form in which menthol is imported it bears some resemblance to Epsom salts, with which it is sometimes adulterated.

The volatile oil of Mentha piperita is a valuable and widely used drug. Its chief constituents are menthol and menthene, which is a liquid terpene. The British pharmacopoeia contains two preparations of this oil, the Agu menthae pipertae and the Spiritus menthae pipertae. The oil has the characters of its chief constituents, certain special features. Its local anaesthetic action is exceptionally strong. It is also powerfully antiseptic. These two properties make it available in the relief of toothache and in the treatment of curious cavities in the teeth. The oil also acts on the nerve of relieving pains arising in the alimentary canal. The volatile oil of spearmint is also official in Great Britain and the United States, being given in the same doses and for the same purposes as oil of peppermint. It is of less value medically, not containing any appreciable quantity of menthol, the place of which is taken in the oleum menthae viridis-
during the "French and Indian War," and received the rank of lieutenant-general in February 1759. He died in Kittery, Maine, on the 22nd of July in the same year.

See Usher Parsons, Life of Sir William Pepperell, Bart. (Cambridge, Mass., 1855), based on the family papers.

**PEPPER TREE**, a tree which has no proper connexion with the true pepper (Piper), and is really a member of the natural order Anacardiaceae, being known botanically as Schinus Molle, from the Peruvian name Mulli. It is a native of tropical South America and is grown in the open air in the south of Europe. It is a small tree with unequally pinnate leaves, the segments linear, entire or finely saw-toothed, the terminal one longer than the rest, and all filled with volatile oil stored in large cells or cysts, which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as to violently agitate the grain. The fruit is a small, whitish, arranged in terminal clusters and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushion-like disk surrounding the base of the three-celled ovary). The style is simple or three-cleft, and the fruit a small, globose, pea-like drupe with a bony kernel enclosing a single seed. The fleshy portion of the fruit has a hot aromatic flavour from the abundance of the resin it contains. The resin is used for medicinal purposes by the Peruvians, and has similar properties to mastic. The Japan pepper tree is Xanthoxylum piperitum the fruits of which have also a hot taste. Along the Riviera the tree known as Melia Azedarach, or the "Pride of India," is also incorrectly called the pepper tree by visitors.

**PEPSIN**, an enzyme or ferment obtained by drying the mucous lining of the fresh and healthy stomach of a pig, sheep or calf. As an ingredient it is employed in the manufacture of process of preparing milk for the preparation of peptonized milk. The following is a method of preparing it. Take a clean glass quart bottle, pour in a pint of perfectly fresh cold water, then add a tablespoon or of pale yellow translucent peptone or scales. It is only slightly soluble in water and alcohol.

Pepsin digestes the albumens but is useless in the digestion of fats or carbohydrates. It may also be used to predigest albuminous foods. The following is a method of peptonizing beef. Take 1 lb. of beef, well washed, 1 Bd. of 3 per cent. hydrochloric acid, place in a jar with 50 grs. of pepsin, set in a warm place at 110° F. for 3 hours, stirring occasionally. Then quickly boil it. It is usually unnecessary to strain it, as the meat is reduced to a brownish, highly peptoneable pelllicle, readily assimilated for which is readily assimilated. Many varieties of proprietary peptonizing tablets are on the market and are convenient for the preparation of peptonized milk. The following is a method of preparing it. Take a clean glass quart bottle, pour in a pint of perfectly fresh cold water which has been peptonized tablet has been dissolved. Submerge the bottle in a can of water at 100° F. for from 5 to 10 minutes, take out the bottle and place on ice to prevent the further action of the pepsin. If no ice is convenient bring the milk and boil for the same purpose. If the action of the pepsin be continued for a much longer period the milk becomes bitter to the taste from the development of excess of peptones. Predigested foods should not be further peptonized as the digestive functions of the stomach may atrophy from abuse.

Pancreatic solution, derived from the pancreas of a pig digested in alcohol, has the power of converting starch into sugar, and albumen and fibrin into peptones. It only acts in an alkaline medium and at a temperature under 140° F. If used to peptonize milk sodium bicarbonate should be added. Many commercial preparations are on the market. Trypsin, the principal ferment of the pancreas, also changes proteids into peptones.

**PEPUSCH, JOHN CHRISTOPHER** (1667–1758), English musician, of German parentage, was born in Berlin. He began his career as a child, and, about 1700, left Berlin and went to England, where he became a citizen, and where he went on with his researches into ancient music. He composed a number of church services and instrumental pieces, besides music for masques and plays, but he is best known in connexion with the founding in 1710 of the Academy of Ancient Music. In 1713 he was made a Mus.D. of Oxford, and in 1746

F.R.S. In 1718 he married Margarita de l'Épiné (d. 1746), who, as the first Italian to sing in England, was described in 1692 in the London Gazette simply as "the Italian woman." Pepsch died in London on the 20th of July 1752. His Treatise on Harmony (anonymous 1st ed. 1736) is believed to have been an embodiment of his rules drafted by his pupil Viscount Paisley, afterwards earl of Abercorn.

**PEPYS, SAMUEL** (1633–1703), English diarist, was born on the 23rd of February 1663. The place of his birth is not known. The name was pronounced in the 17th century, and has always been pronounced by the family, "Pepps." The family can be traced in Cambridgeshire as far back as the reign of Edward I. They rose by slow degrees from the class of small copyholders and yeoman farmers to the position of gentry. In 1593 they had a recognized right to use a coat of arms. John Pepys, Samuel's father, was a younger son, who, like other gentlemen in his position in that age, went into trade. He was for a time established as a tailor in London, but in 1661 he inherited a small estate at Brampton near Huntingdon, where he lived during the last years of his life.

Samuel was fifth child and second son of a large family, all of whom he survived. His first school was in Huntingdon, but he was afterwards sent to St Paul's in London, where he remained till 1650. While at St Paul's he was an eye-witness of the execution of King Charles I. On the 21st of June in that year his name was entered as a sizar on the books of Trinity Hall, Cambridge, but it was transferred to Magdalene on the 1st of October. On the 5th of March he entered into residence, and he remained there till 1654 or 1655. He obtained a Spendleffe scholarship a month after entering, and one on Dr John Smith's foundation on the 14th of October 1652. Nothing is known of his university career except that on the 21st of October 1653 he was publicly admonished with another undergraduate for having been "carad and contemned" to purchase a pack of cards. He was afterwards destroyed.

On the 1st of December 1655 he was married at St Margaret's church, Westminster, to Elizabeth, daughter of Alexander Marchant, Sieur de St Michel, a French Huguenot exile from Anjou who had married an English lady named Kingsmill. Pepys had at this time no independent means, and probably relied on his cousins, the Montagues, to provide for him. On the 26th of March 1658 he was cut for the stone, an event which he always kept in memory by a solemn anniversary. In 1659 he went as secretary with his cousin, Edward Montagu, afterwards Earl of Sandwich, on a voyage to the Sound. On his return he was engaged as a clerk under Mr (afterwards Sir) Edward Downing, one of the four tellers of the exchequer. In 1660 he accompanied his cousin, who commanded the fleet which brought King Charles II. back from exile. In that year, by the interest of his cousin, he was named "clerk of the acts" in the Exchequer office, but was compelled to buy off a competitor, one Barlow, by an annuity of £100.

Pepys was now fairly established in the official career which led him to honour. On the 1st of January 1660 he had begun his second and hidden life as a diarist. It is in that capacity that he is of such unique interest. But if his diary had never been written, or had been lost, he would still be a notable man, as an able official, the author of valuable Memoirs of the Navy (1690), an amateur musician and protector of musicians, a gentleman who took an enlightened interest in science, and was elected president of the Royal Society. To his contemporary diarist, John Evelyn, he appeared as a "worthy, industrious and curious person." It is true that Andrew Marvel accused him of having accumulated a fortune of £40,000 by "illegal wages." But this charge, made in a pamphlet called A List of the principal Labourers in the great design of Popery and Arbitrary Power, was attributed to political animosity. To the world he appeared as an honourable and religious man, and so he would seem to have been to us if he had not recorded in his diary all those weaknesses of character and sins of the flesh which other men are most careful to conceal.

His place of clerk to the Navy Board was equivalent to the...
post of permanent under secretary in modern times. It made him chief of the secretariat and a member of the administering body of the navy. Though he was so ignorant of business that he did not even know the multiplication table when he first took office, he soon mastered the needful mechanical details by working early and late. He had other posts and honours, which came to him either as consequential on his clerkship or because he was a useful official. On the 23rd of July 1660 he was appointed one of the clerks of the privy seal, an office which returned him £2 a day in fees. He was made a justice of the peace. In 1662 he was appointed a younger brother of the Trinity House, and was named a commissioner for managing the affairs of Tangier, then occupied by an English garrison. In 1664 he became a member of the corporation of the Royal Fishery, to which body he was named treasurer when another official had brought the accounts into confusion. In that year he also joined the Royal Society. During the naval war with Holland (1664-67) he proved himself an indefatigable worker. As surveyor of the victualling, the whole burden of a most important department was thrown on him in addition to his regular duties. He in fact organized the department. While the plague was raging in London in 1666 he remained at his post when many of his colleagues ran away, and he manfully avowed his readiness to take the risk of disease, as others of the king’s servants faced the dangers of war. He had now gained the full confidence of the lord high admiral, the duke of York, afterwards King James II. When, on the termination of the war, the navy office was violently attacked in parliament, he was entrusted with its defence. The speech which he delivered at the bar of the House of Commons on the 5th of March 1668 passed for a complete vindication. In sober fact the charges of mismanagement were well founded, but the fault was not in the officials of the navy office only, and Pepys, who was master of the details, had no difficulty in throwing dust in the eyes of the House of Commons, which was ignorant. Nobody indeed was better acquainted with the defects of the office, for in 1668 he drew up for the duke of York two papers of inquiry and rebuke, “The Duke’s Reflections on the several Members of the Navy Board’s Duty” and “The Duke’s answer to their several excuses” (Harleian MS. 6003). In 1669 he travelled abroad. His success in addressing parliament gave him the ambition to become a member of the House of Commons. He stood for Aldborough, but the death of his wife, on the 10th of November 1669, prevented him from conducting his canvass in person, and he was not elected. In 1673 he was returned for Castle Rising. The validity of his election was questioned by his opponent, Mr Offley, and the committee of privilege decided against him, but the prorogation of the house prevented further action. The no-popery agitation was now growing in strength. The duke of York was driven from office by the Test Act, and Pepys was accused of “popery,” partly on the ground that he was said to keep a crucifix and altar in his house, partly because he was accused of having converted his wife to Roman Catholicism. The crucifix story broke down on examination, but there is some reason to believe that Mrs Pepys did become a Roman Catholic. Pepys was transferred by the king from the navy office to the secretariety of the admiralty in 1673. In 1679 he was member for Harwich, and in the height of the popish plot mania he was accused, manifestly because he was a trusted servant of the duke of York, of betraying naval secrets to the French, but the charges were finally dropped. Pepys was released on bail on the 12th of February 1680. In that year he accompanied the king to Newmarket, and took down the narrative of his escape after the battle of Worcester. A proposal to make him head of the College, Cambridge, in 1681, came to nothing. In 1682 he accompanied the duke of York to Scotland, where the uncleanly habits of the people caused him great offence. In 1683-1684 he was engaged in arranging for the evacuation of Tangier. He visited the place and kept a diary of his voyage. In 1684 he was elected president of the Royal Society. On the accession of King James II. in 1685 he retained his place as secretary to the admiralty, to which he had been appointed by patent when James resumed the lord high admiralty (June 10, 1684), and Pepys was in effect minister for the navy. The revolution of 1688 ended his official career. He was dismissed on the 9th of March 1689, and spent the rest of his life in retirement, and, except for a brief imprisonment on the charge of Jacobite intrigue in 1690, in peace. He died at his house in Clapham on the 25th of May 1703. His last years were passed in correspondence with his friends, who included Evelyn and Dryden, or arranging his valuable library. It was left on his death to his nephew, John Jackson, son of his sister Pauline, and in 1724, by the terms of his will, was transferred to Magdalene College, Cambridge, where it is still preserved.

Such was the outward and visible life of Samuel Pepys, the public servant whose diligence was rewarded by success. The other Pepys, whom Sir Walter Scott called “that curious fellow,” was revealed in 1825, when his secret diary was partly published. The first entry was made on the 1st of January 1660, the last on the 31st of May 1669, when the increasing weakness of his eyes, which had given him trouble since 1666, compelled him to cease writing in the conditions he imposed upon himself. If there is in all the literature of the world a book which can be called “unique” with strict propriety it is this. Confessions, diaries, journals, autobiographies abound, but such a revelation of a man’s self has not yet been discovered. The diary is a thing apart by virtue of three qualities which are rarely found in perfection when separate and nowhere else in combination. It was secret; it was full; and it was honest. That Pepys meant it for his own eye alone is clear. He wrote it in Shelton’s system of tachygraphy published in 1643, which he complicated by using foreign languages or by varieties of his own invention whenever he had to record the passages least fit to be seen by his servants or by “all the world.” Relying on his cypher he put down whatever he saw, heard, felt or imagined, every motion of his mind, every action of his body. And he noted all this, not as he desired it to appear to others, but as it was to his seeing. The result is “a human document” of amazing vitality. The man who displays himself to himself in the diary is often odious, greedy, cowardly, casuistical, brutal. He tells how he kicked his cook, and blacked his wife’s eye, and was annoyed when others saw what he had done. He notes how he compelled the wives of unfortunate men who came to draw his husband’s pay at the navy office to prostitute themselves; how he took “compliments,” that is to say gifts, from all who had business to do with the navy office; how he got tipsy and suffered from sick headache; how he repented, made vows of sobriety, and found casuistical excuses for breaking them. The style is as peculiar as the matter—colloquial, garrulous, racy from simplicity of language, and full of the unconscious humour which is never absent from a truthful account of the workings of nature in the average sensual man. His position enabled him to see much. His complete harmony with the animalism and vulgarity of the Restoration makes him a valuable witness for his time. To his credit must be put the facts that he knew the animalism and vulgarity to be what they were; that he had a real love of music and gave help to musicians, Cesare Morelli for instance; that though he made money out of his places he never allowed bad work to be done for the navy if he could help it; that he was a hard worker; and that he had a capacity for such acts of kindness and generosity as are compatible with a gross temperament and a pedestrian ambition.

The diary, written in a very small hand in six volumes, was included among his books at Magdalene. On the publication of Evelyn’s diary in 1818, the then head of Magdalene, the Hon. and Rev. George Neville, decided to publish Pepys’s. Part of the MS. was deciphered by his cousin Lord Grenville. The library contained both the short and the long-hand copies of Pepys’s account of King Charles’s adventures, but his books were little known by the curators that this key was overlooked. The MS. was deciphered by John Smith, afterwards rector of Baldock in Hertfordshire, between 1819 and 1822. The first and partial edition, edited by Richard Neville Griffin, 3rd Lord Braybrooke, appeared in 1825 in two volumes quarto (London). It attracted great attention and was reviewed by Sir Walter Scott in the Quarterly for January 1826. A second edition in two octavo
volumes followed in 1828 (London). A third and enlarged edition in five volumes octavo appeared in 1848-1849, and a fourth in four in 1854 (London). In 1857-1859 Dr Minoves Bright published a still fuller edition in six volumes octavo (London). Many portraits of Peysys are known to have been taken and several can be traced. One was taken by Savill (1661), another by John Hales (1666), now in the National Portrait Gallery. A portrait by Sir Peter Lely is in the Pepysian library, Magdalene College, Cambridge. Three portraits were taken by Sir Godfrey Kneller, of which one belongs to the Royal Society, and another is in the Hall of Magdalene. Peysys’s only known publication in his life was the Memoirs of the Navy, but other writings have been attributed to him.

AUTHORITIES.—The standard edition of Peysys’s works is that by H. B. Wheatley, in nine volumes octavo, with a supplementary volume of Pepysiana (London, 1895-1896). See also Wheatley’s Samuel Pepys, and the world he lived in (London, 1880); The Life and Correspondence of Pepys, by J. Smith (London, 1841); E. H. Moorhouse, Samuel Pepys, Administrator, Observer, Gossip (1909); and P. Lubbock, Samuel Pepys (1909). (D. H.)

PEQUOT, an Algonquian tribe of North-American Indians, a branch of the Mohicans. They occupied the coast of Connecticut from Niantic river to the Rhode Island boundary. Together with their kinsmen, the Mohegans, they formed a powerful and warlike people, bitterly hostile to the early settlers. In 1637 the Pequot were surprised by the whites at their fort on the Mystic river, and suffered so completely a defeat that the tribe was broken up, and its remnants took refuge with neighbouring tribes. The Pequot country passed under the control of the Mohegans. At the height of their power the Pequots numbered, it is estimated, some 3,000.

PERCEPTION (from Lat. percipere, to perceive), in psychology, the term specially applied to the mental process by which the mind becomes conscious of an external object; it is the mental completion of a sensation, which would otherwise have nothing but a momentary existence coextensive with the duration of the stimulus, and is intermediate between sensation and the “ideal revival,” which can reestablish a perceptual consciousness when the object is no longer present. This narrow and precise usage of the term “perception” is due to Thomas Reid, whose view has been generally adopted in principle by modern psychologists. On the other hand some psychologists decline to accept the view that the three processes are delimited by sharp lines of cleavage. It is held on the one hand that sensation is in fact impossible as a purely subjective state, and that perception is the psychological reality. The terms sensation and perception differ only in degree of perception being the more complex. The former view admits, which the latter practically denies, the distinction in principle. Among those who adopt the second view are E. B. Titchener and William James. James (Principles of Psychology, ii. 76) compares sensation and perception as “the barer and the richer consciousness,” and says that “beyond the first crude sensation all our consciousness is a matter of suggestion, and the various suggestions shade gradually into each other, being one and all products of the same psychological machinery of association.” Similarly Wundt and Titchener incline to obliterate the distinction between perception and ideal revival. Prior to Reid, the word perception had a long history in the wider sense of cognition in general. Locke and Hume both use it in this sense, and regard thinking as that special kind of perception which implies deliberate attention. (See Psychology.)

PERCEVAL, or PERCEVelle (Ger. Parzival, Fr. Perlesvaus, Welsh, Peredur), the hero of a comparatively small, but highly important, group of romances, forming part of the Arthurian cycle. Originally, the story of Perceval was of the character of a folk-tale, and that of one of remarkable importance and world-wide diffusion. He is represented as the son of a widow, “la dame veuve,” his father having been slain in tourney, battle or by treachery, either immediately before, or shortly after his birth. The mother, fearful lest her son should share his father’s fate, flies to the woods, either alone with one attendant, or with a small body of faithful retainers, and there brings up her son in ignorance of his name, his parentage and all knightly accomplishments.

The youth grows up strong, swift-footed and of great personal beauty, but, naturally enough, of very limited intelligence. This last is one of the most characteristic traits of the Perceval story, connecting it alike with the Irish Lay of the Great Food, and the Teutonic Dietmæriene tales. He spends his days chasing the beasts of the forest, running them down by sheer speed, or killing them with darts (javelots) or bow and arrows, the only weapons he knows.

One day, however, he meets a party of knights in armour; he first adores the leader as God, and then takes them to be some new and wondrous kind of animal, asking the most naïve questions as to their armour and equipment. Being told that they are knights he determines that he too will be one, and returns to his mother announcing his intention of at once setting forth into the world to seek for knighthood. Dressed as a peasant (or a fool), he departs (his mother, in some versions, dying of grief), and comes to the king’s court. Of course in the romance it is the court of Arthur; probably in the original tale it was simply “the king.” Here his uncouth behaviour and great personal beauty attract general attention, and he is alike mocked by Kay, and his future distinction mysteriously foretold. He slays a foe of Arthur’s, the Red Knight, who has insulted the king, and challenged the knights of the court, who, for some mysterious reason, are unable to respond to the challenge. He first of all is unable to defend himself, but in great difficulty in handling and eventually puts on his patient’s garb, he sets out on a series of adventures which differ greatly in the various versions, but the outcome of which is that he becomes a skilful and valiant knight and regains the heritage of his father.

This, the Perceval story proper, has been recognized by scholars as a variant of a widespread folk-tale theme, designated by J. C. von Hahn as the Arvyn Expulsion and Return formula, which counts among its representatives such heroes as Perseus, Cyrus, Romulus and Remus, Siegfried, and, as Alfred Nott has pointed out, Arthur himself. This particular variant appears to be of British-Celtic origin, and the most faithful representative of the original tale is now very generally held to be the English STr Percevalle of Galles, a poem preserved in the Thornton manuscript. Here the hero is nephew to Arthur on the mother’s side, and his father, of the same name as himself, is a valiant knight of the court. A noticeable feature of the story is the uncertainty as to the hero’s parentage; the father is always a humble person, one of the vulgar of the realm, who is knighthood. Among the vulgar is a king, more often merely a valiant knight, and in no instance does he appear to be of equal rank with his wife. This distinguishes the story from that of Lancelot, with which some modern scholars have been inclined to identify it; for Lancelot’s parentage is never in doubt, he is fis du roi.

The connexion of the story with Arthur and his court brought about a speedy and more important development, the precise steps of which are not yet clear: Perceval became the hero of the Grail quest, in this outwisting Gawain, to whom the adventure originally belonged, and the Perceval became merged in the Grail tradition. Of the Perceval-Grail romances the oldest from the point of view of manuscript preservation is the Perceval or Conte del Grail of Chrétien de Troyes. Two manuscripts, indeed, the British Museum and Mons texts, preserve a fragment relating the birth and infancy of the hero, which appears to represent the source at the root alike of Chrétien and of the German Parsival, but it is only a fragment, and so far no more of the poem has been discovered. Chrétien left his poem unfinished, and we do not know how he intended to complete the adventures of his hero; but those writers who undertook the task, Wauchier de Denain, Gerbert de Montreuil and Manessier, carried it out with such variety of detail, and such a bewildering indifference to Chrétien’s version, that it seems practically certain that there must have been, previous to Chrétien’s work, more than one poem dealing with the same theme. The German poet, Wolfram von Eschenbach, whose Parsival in parts closely agrees with the Perceval and who was long held to be a mere translator of Chrétien,
differ widely in the setting of its story. He gives an introduction, in which the adventures of the father, here a prince of Anjou, are related; a conclusion, in which the Swan-Knight, Loengrin, is made Parzival's son; he represents the inhabitants of the Grail castle as Templars (Templeisen); and makes the Grail itself a stone. Finally, he reproaches Chrétien with having told the story amiss, whereas Kiot, the Provençal, whose version Wolfram was following, had told it rightly from beginning to end. It is certain that Gerbert knew, and used, a Perceval which, if not Kiot's poem, must have been closely akin to it; as he too makes the Swan-Knight a descendant of the Grail hero. The probability seems to be that the earliest Perceval-Grail romance was composed at Fescamp, and was coincident with the transformation, under the influence of the Saint-Sang legend, of the originally Pagan talisman known as the Grail into a Christian relic, and that this romance was more or less at the root of all subsequent versions.

Besides the poems, we have also two prose Perceval romances, the relative position of which has not yet been satisfactorily determined. The first is found in two manuscripts only, the so-called "Didot" (from its original possessor M. Firmin-Didot), now in the Bibliothèque Nationale, Paris; the other, and much superior text, in the Biblioteca Estense, Modena. In both cases the romance follows the prose rendering of Borron's Joseph of Arimathoe and Merlin, and precedes a Mort Artus, thus forming part of a complete cycle. The text shows a curious mingling of sources: the real primitive Perceval story, the Enfances, is omitted; he grows up in his father's house and goes to court at his wish. Later, however, stories which certainly derive from an early non-Grail tradition are introduced, and there are references which imply a knowledge of the prose Lancelot and of Chrétien's poem. The romance is probably a somewhat late, and not very skillful, compilation. The other prose romance, the Perlesvaus, is decidedly superior in literary form, but here too we have a mingling of old and new elements. The Enfances story is omitted, and there are parallels with the German Parsival, with Wauchier de Denain and with Gerbert, while much is peculiar to the Perlesvaus itself. It is not improbable that it represents a free and individual working over of the original Fescamp version, and that in its later shape it was intended to form, and did at one time form, the Quest section of the cyclic redaction of the Arthurian prose romances, being dislodged from this position by the Galahad Quest. It is a curious fact that the printed editions always give it in conjunction with this latter and that the two have also been preserved together in a Welsh manuscript translation. We also possess in one of the so-called Mabinogi a Welsh version of the tale, Peredur, son of Erawd. This appears to be a free rendering of the adventures found in Chrétien combined with incidents drawn from Welsh tradition. This was at one time claimed as the original source of all the Perceval romances, but this theory cannot be maintained in face of the fact that the writer gives in one place what is practically a literal translation of Chrétien's text in a passage which there is strong reason to believe was borrowed by Chrétien from an earlier poem. In order of time the Peredur probably ranks latest in the series of Perceval romances, which, however, does not detract from its interest as a possible representative of genuine Welsh traditions, unknown to other writers.

The value and interest of the Perceval romances stand very high, not alone for their intrinsic merit, though that is considerable—Chrétien's Perceval, though not his best poem, is a favourable specimen of his work, and von Eschenbach's Parsival, though less elegant in style, is by far the most humanly interesting, and at the same time, most deeply spiritual, of the Grail romances—but also for the interest of the subject matter. The Perceval story is an admirable folk-tale, the Grail problem is the most fascinating problem of medieval literature; the two combined form a romance of quite unique charm and interest. This has been practically proved by the extraordinary success which has attended Richard Wagner's dramatic re-telling of the legend in his Parsifal. The immediate source of this version is the poem of Wolfram von Eschenbach, though the Grail, of course, is represented in the form of the Christian relic, not as the jewel talisman of the Parsival; but the psychological reading of the hero's character, the distinctive note of von Eschenbach's version, has been adapted by Wagner with marvellous skill, and his picture of the hero's mental and spiritual development, from extreme simplicity to the wisdom born of perfect charity, is most striking and impressive.

BIBLIOGRAPHY.—There are early printed editions of the Perceval (1539) and of the Perlesvaus (1516 and 1552). The Perceval was edited from the Mons text by Potvin (6 vols., 1866-1871); Sir Perceval, by T. H. Parry (1888). The Frontispiece to the text of an edition of the Perlesvaus was published by L. L. Weston (1894), and the "Didot" Perceval was published by J. W. L. Weston (1895). The Perceval was edited by Dr. Sebastian Evans is published in "The Temple Classics," under the title of The High History of the Holy Grail. Peredur will be found in Alfred Nutt's edition of the Mabogionog (1902). For the critical treatment of the "Dithyramb of the Legend of Sir Perceval (Grimm Library, vol. xxvii); Perlesvaus by Nitzte (1902); Legends of the Wagner Drama by J. W. L. Weston.

PERCEVAL, SPENCER (1762–1812), prime minister of England from 1809 to 1812, second son of John, 2nd earl of Egmont, was born in Audley Square, London, on the 1st of November 1762. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln's Inn in 1786. A very able speech in connexion with a famous forgery having drawn attention to his talents, his success was from that time rapid, he was soon regarded as the leading counsel on the Midland circuit, and in 1796 became a K.C. Entering parliament for Northampton in April of that year, he distinguished himself by his speeches in support of the administration of Pitt. On the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic Emancipation, he delivered in 1807 a speech on the subject which helped to give the death-blow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of the first rank, he succeeded in retaining office till he was shot by a man named Bellingham, a bankrupt with a grievance, who had vainly applied to him for redress, in the lobby of the House of Commons on the 11th of May 1812. Bellingham was certainly insane, but the plea was set aside and he was hanged. Perceval was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage. He married in 1790 and had six sons and six daughters; one of the latter married Spencer Horatio Walpole, 5th home secretary, and their son Sir Spencer Walpole, the well-known historian, published an excellent biography of Perceval in 1872.

See also P. Treherne, Spencer Perceval (1909).

PERCH (through Fr. from Lat. perca, Gr. περκα; the last word is connected with περκός, dark-coloured, spotted), a fresh-water fish (Perca fluviatilis), generally distributed over Europe, northern Asia and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the Percidae, which is represented in European freshwaters by several other fishes such as the pike (Acerina cernua) and the pike-perch (Lucioperca). It inhabits rivers as well as lakes, but thrives best in waters with a depth of not less than 3 ft.; in large deep lakes it frequently descends to depths of 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 ft.
**PERCH—PERCY (FAMILY)**

The shape of its body is well proportioned, but many variations occur, some specimens being singularly high-backed, others low and long-bodied; sometimes such variations are local, and Agassiz and other naturalists at one time thought it possible to distinguish two species of the common perch of Europe; there are not even sufficient grounds, however, for separating specifically the North-American form, which in the majority of ichthyological works is described as *Perca flavescens*. The brilliant and striking colours of the perch render it easily recognizable even at a distance. A rich greenish-brown with golden reflections covers the back and sides, which are ornamented with five or seven dark cross-bands. A large black spot occupies the membrane between the last spines of the dorsal fin; and the ventral, anal and lower part of the caudal are bright vermilion. In the large peaty lakes of north Germany a beautiful variety is not uncommon, in which the golden tinge prevails, as in a goldfish.

The perch is strictly carnivorous and most voracious; it wanders about in small shoals within a certain district, playing sad havoc among small fishes, and is therefore not to be tolerated in waters where valuable fry is cultivated. Perch of three pounds in weight are not infrequently caught in suitable localities; one of five would be regarded as an extraordinarily large specimen, although in older works we read of individuals exceeding even that weight.

Perch are good, wholesome food, and highly esteemed in inland countries where marine fish can be obtained only with difficulty. The nearly allied Pike-perch is one of the best European food-fishes. The perch is exceedingly prolific; it begins to spawn when three years old, in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands, on water plants.

**PERCH** (through Fr. perche from Lat. *perca*, a pole or rod used for measurement), a bar or rod used for various purposes, as *e.g.* for a navigation mark in shallow waters, for a support on which a bird may rest, or for a pole which joins the back with the fore part of a wagon or other four-wheeled vehicle. As a term of linear measurement, "perch," also "rod" or "pole," = 16½ ft., 53 yds.; of superficial area, = 30½ sq. yds.; 160 perches = 1 acre. As a stonemason's measure, a "perch" = 1 linear perch in length by 1½ ft. in breadth and 1 ft. in thickness.

**PERCHE**, a region of northern France extending over the departments of Orne, Eure, Eure-et-Loir and Sarthe. Its boundaries are Normandy on the N. and W., Maine on the S.W., Vendômois and Dunois on the S., Beauce on the E. and Thimerais on the N.E. The greater part of the district is occupied by a semicircle of heights (from 650 to 1000 ft. in height) stretching from Moulins-la-Marche on the north-west to Montmirail on the south; within the basin formed thereby the shape of which is defined by the Huine, an affluent of the Sarthe, lie the chief towns—Mortagne, Nogent-le-Rotrou and Bellême. Stock-raising and dairy-farming are flourishing in the Perche, which is famous for the production of a breed of large and powerful horses. Cider-apples and pears are grown throughout the district. In the middle ages the Perche constituted a countyship of which Corbon, Mortagne and Nogent-le-Rotrou were successively the capitals. Under the ancien régime it formed, together with Maine, a gouvernement of which Mortagne was the capital.

**PERCIVAL, JAMES GATES** (1795-1856), American poet, philologist and geologist, was born in Kensington parish, Berlin, Connecticut, on the 13th of September 1825. He graduated at Yale in 1815, and in 1820 took the degree of M.D., and started practice in Berlin. He contributed verse to the *Microscope*, a semi-weekly paper, founded at New Haven in 1820. In this first appeared his best-known poem, "The Suicide," which reflects his chronic melancholy, due doubtless to ill-health; it was begun in 1816 and finished in 1820, after he had actually made two attempts on his own life. In 1823 Percival became an editor of the *Connecticut Herald* at New Haven; and in 1824 he was in turn an assistant-surgeon and lecturer on chemistry at West Point, and an inspector of recruits at the Charlestown (Mass.) Navy Yard. He prepared (1826-1831) an English edition of Malte-Brun's *Geography* (published 1834); and in 1827-1829 read the manuscripts and proof-sheets of *Webster's Dictionary*, giving special attention to scientific words. In 1835-1840, with Professor Charles U. Shepard (1804-1886), he made a geological survey of Connecticut; his *Report* (1842) showed great learning and much patient research. In 1854 he became state geologist of Wisconsin, and in 1855 published one volume of his *Report*; the second he had nearly completed at the time of his death, on the 22nd of May 1856, at Hazel Green, Wisconsin. See his *Critical Works* (2 vols., Boston, 1859), with a biographical sketch by L. W. Fitch; and Julius H. Ward, *Life and Letters of James Gates Percival* (Boston, 1866).

**PERCY** (FAMILY). This family, whose deeds are so prominent in English history, was founded by William de Percy (c. 1030-1096), a follower of the Conqueror, who bestowed on him a great fief in Yorkshire and Lincolnshire. The register of Whitby Abbey, which he founded anew, and in later days the heralds, were responsible for the fabulous origin and pedigree of the family which are still current. By Emma, daughter of Hugh de Port, a great Hampshire baron, William was father of several sons, of whom Alan the eldest succeeded him. His grandson William was the last of the house in the direct line, and left two sisters and coheirses, Maid countesses of Warwick, who died childless, and Agnes. Agnes de Percy had married Josceline, styled "brother of the queen" (i.e. Adeliza of Louvain, second wife of Henry I.), whose legitimacy has been questioned, and from whom the marriage descended the second house of Percy (which name it assumed), till its own extinction in the male line five centuries later (1670). By it was brought into the family the great Petworth estate in Sussex, which Josceline had obtained from his sister, who was holding Arundel and its fief. His son Richard (c. 1170-1244) and Richard's nephew William (c. 1183-1245) were among the barons who rose in arms against John, but the latter made his peace with Henry III., and had his lands restored to him. Richard de Percy was one of the twenty-five barons appointed to enforce the observance of Magna Carta.

The next important member of the family is William's grandson Henry de Percy (c. 1272-1315), whom Edward I., after the deposition of John Baliol, appointed governor of Galloway, and who was one of his most active agents in the subjugation of Scotland till the success of Robert Bruce drove him out of Turnberry Castle, and made him withdraw into England. He was rewarded by Edward II. with the barren title of earl of Carrick, declared to be forfeited by the Scottish hero; and the same king appointed him governor of the castles of Bamborough and Scarborough. But in 1309 he himself made his position strong in the north of England by purchasing lands from Anthony Bek, bishop of Durham, among which was the honour of Alnwick, the principal seat of the family ever since. The Percies had chiefly resided till then at Spofforth in Yorkshire, and their connexion with Northumberland dates from this acquisition. Henry's son, another Henry (c. 1309-1352), took part in the league against Edward II. His favourites the Despencers, was in favour with Edward III., and obtained from Edward Baliol as king of Scotland grants of Lochmaben, Annandale and Moffatdale, which he surrendered to the English king for the castle and constabulary of Jedburgh, or Jedworth, with the forest of Jedworth and some neighbouring towns. A few years later, in fuller recompense of the unprofitable gift of Baliol, a grant of 90 marks a year was made to him out of the old customs at Berwick.
and in 1346 he did splendid service to his sovereign by defeating and taking prisoner David II., king of Scotland, at the battle of Neville's Cross.

To him succeeded another Henry Percy (1322–1368), a feudal baron like his predecessors, who fought at Crécy during his father's lifetime and whose brother Thomas Percy (1333–1359) was bishop of Norwich from 1356–1359. The next head of the Percy was Henry's son, another Henry, who was made earl of Northumberland at the coronation of Richard II., and whose younger brother Thomas (d. 1403) was created earl of Worcester in 1397. The 1st earl of Northumberland, father of the famous Hotspur, Sir Henry Percy (q.v.), was killed at Bramham Moor in 1408, while in arms against the king, and his title and estates were forfeited. But, by an act no less gracious than politic, Henry V. restored them in 1414 to this earl's grandson, Henry (1394–1455), then a prisoner with the Scots, whose liberation he had no difficulty in procuring from the duke of Albany during the time of James I.'s captivity. From that day the loyalty of the family to the house of Lancaster was steadfast and undeviating. The 2nd earl died fighting for Henry VI. at the first battle of St Albans in 1455; the 3rd, Henry (1421–1461), was slain on the bloody field of Towton; the 4th, Henry (1446–1480), was killed in quelling an insurrection in the time of Henry VII. So strong was the Lancastrian feeling of the family that even Sir Ralph Percy (1425–1464), a brother of the earl who fell at Towton, though he had actually submitted once to Edward IV., turned again, and when he fell at Hedgeley Moor in April 1469 conspired himself with the thought that he had, as he phrased it, "saved the bird in his bosom."

No wonder, then, that in Edward IV.'s days the title and estates of the family were for a time taken away and given to John Neville Lord Montagu, brother of Warwick the king-maker. But the north of England was so accustomed to the rule of the Percys that in a few years Edward saw the necessity of restoring them, and did so even at the cost of alienating still further the powerful family of the Nevilles, who were then already on the point of remembrance.

A crisis occurred in the fortunes of the family in the reign of Henry VIII. on the death of Henry, the 6th earl (c. 1502–1537), whose brothers Sir Thomas and Sir Ingelram Percy, much against his will, had taken part in the great insurrection called the Pilgrimage of Grace. A thriftless man, of whom it is recorded that in his youth he was smitten with the charms of Anne Bolena, but was forced to give her up and marry a woman he did not love, he died childless, after selling many of the family estates and granting the others to the king. The title was forfeited on his death, and was granted by Edward VI. to the ambitious John Dudley, earl of Warwick, who was attained in the succeeding reign. It was restored in the days of Queen Mary to Thomas Percy (1528–1572), a nephew of the 6th earl, who, being a staunch Roman Catholic, was one of the three earls who took the lead in the celebrated rising of 1572, and was beheaded at York. His brother Henry (c. 1512–1568), who succeeded him, was no less unhappy. Involved in Throckmorton's conspiracy, he was committed to the Tower of London, and was supposed to have shot himself in bed with a pistol found beside him; but there were grave suspicions that it had been discharged by another hand. His son, Henry (1569–1632), the next earl, suffered like his two predecessors for his attachment to the religion of his forefathers. The Crown lawyers sought in vain to implicate him in the Gunpowder Plot, but he was imprisoned for fifteen years in the Tower and compelled to pay a fine of £30,000. Algernon (1602–1668), the son who next succeeded, was a parliamentary general in the Civil War. At length, in 1670, the male line of this illustrious family became extinct, at least in the direct line, about five hundred years after the marriage of Agnes de Percy with Josceline of Louvain.

The representation of the earlier Percys had passed away through the daughters of Earl Thomas, beheaded in 1572, but his earldom of Northumberland (created anew for him in 1557) had passed to his brother Henry, under a special remainder, and appears to have become extinct in 1670, though persistently claimed by James Percy, "the trunk-maker." The last earl's daughter Elizabeth, a great heiress, was mother by Charles Seymour, 6th duke of Somerset, of Algernon, 7th duke, who was summoned (in error) as Lord Percy in 1722 and created earl of Northumberland in 1749. On the duke's death in 1750 his earldom of Northumberland passed under a special remainder, with the main inheritance of the Percys, to Sir Hugh Smithson, bart. (1715–1786), who had married his daughter and eventual heiress in 1740, and was created duke of Northumberland and Earl Percy in 1766. From this marriage descends the present ducal house, which bears the name of Percy in lieu of Somerset, and owns vast estates in Northumberland.

Alnwick Castle, their chief seat, where much state is still kept up, has been described by Mr Clark as "probably the finest extant example of a Norman castle of this type, having an open keep and a complete encinte." It had been hardly occupied and in decay for some two centuries when the present family succeeded to it, but was restored by them to its former splendour between 1750 and 1786. "Princely Petworth," however, the seat of the later Percys, with their ancient Sussex estates and those in Yorkshire (Leconfield) and Cumberland (Cockermouth), all passed away in 1750 with the earldom of Egremont and barony of Cockermouth to Charles Wyndham, nephew of the 7th duke of Somerset, and these estates are now held by Lord Leconfield. The actual representation in blood of the later Percys (i.e. from 1572) passed in 1865, on the death of the 4th duke, to the duke of Atholl, who in virtue of it are Lords Percy, under the title of 1722, the oldest of the family titles now remaining. The ancient London residence of the Percys, Northumberland House, Charing Cross, was removed to make way for Northumberland Avenue. Above it stood the Percy crest, a (blue!) lion with stiffly extended tail; but the famous badge of the house was the white crescent or half-moon—"the Half-Moon shining all soe faire "of" the Northern Rising" ballad—with a pair of manacles. Their coat of arms was a blue lion rampant on a yellow ground—"Jacke un blu line frum the millin"—of the Carlaverock roll, stated, but wrongly, to have been derived from the dukes of Louvain and Brabant. With it they quartered the "Luces" coat of the Lucys of Cockermouth after succeeding to their estates, whence the lines in The Battle of Outerborne:—

"The Lucettes and the Crossaunts both,  
The Skotts fought them agayne."

Lindsay, 1902), both somewhat adulatory and needing critical revision; Tate, History of Alnwick (1866); Hartshorne's paper on the Percys and their Castles in the Newcastle volume of the Archaeological Institute (1852); E. A. Freeman, "The Percy Castles" (1875), in English Towns and Districts; G. T. Clark, Medieval Military Architecture (1884); G. E. C. (okay), Complete Peerage (1895), vol. vi.; Bishop Percy, Northumberland Household Book. See also the article Northumberland, Earls and Dukes of. (J. GA.; J. H. R.)

**PERCY, SIR HENRY,** called Hotspur (1364–1403), eldest son of Henry, 1st earl of Northumberland, was born on the 20th of March 1364. He saw active service when he was fourteen at the siege of Berwick. Six years later he was associated with his father in the wardenship of the eastern march of Scotland, and his zeal in border warfare won the name of Hotspur for him from his opponents. In 1386 he was sent to Calais, and raided French territory, but was shortly afterwards recalled to defend England against a naval attack by France. In popular story and ballad he is known as one of the heroes of Otterburn or Chevy Chase, which is the subject of one of the most stirring recitals of Froissart. In the summer of 1388 the Scots invaded England by way of Carlisle, sending a small body under the earls of Douglas, Mar and Moray to invade Northumberland. The earl of Northumberland remained at Alnwick, but sent his sons Sir Henry and Sir Ralph against the enemy. In battle near the heights of Alnwick the Scots were defeated, and it is said to have won Sir Henry's pennon, which he swore to fix upon the walls of Dalkeith. The Scots then retreated to Otterburn, where Percy, who was bent on recovering his pennon, attacked them on a fine August evening in 1388. Douglas was
slain in the battle, though not, as is stated by Walsingham, by Percy's hand: Henry Percy was captured by Sir John Montgomerie, and his brother Ralph by Sir John Maxwell. Hotspur was released on the payment of a heavy ransom, to which Richard II. contributed £30,000, and in the autumn his term as warden of Carlisle and the West March was extended to five years. In 1399 together with his father he joined Henry of Lancaster. Henry IV. gave the charge of the West March to Northumberland, while Henry Percy received the castles of Bamburgh, Roxburgh and Berwick, and the wardenship of the East March, with a salary of £3000 in peace time and £12,000 in war. During the first year of Henry's reign Hotspur further was appointed justiciar of North Wales and constable of the castles of Chester, Flint, Conway, Denbigh and Carnarvon. Henry also gave him a grant of the island of Anglesey, with the castle of Beaumaris. William and Roes ap Tudor captured Conway Castle on the 1st of April 1401, and Percy in company with 500 men of Wales set out to recover the place, providing the funds. In May he reported to the king the pacification of Merioneth and Carnarvon, and before the end of the month Conway was surrendered to him. Meanwhile he wrote demanding arrears of pay, with the threat of resignation if the money were not forthcoming, but the king intimated that the loss of Conway had been due to his negligence, and only sent part of the money. He had the same difficulty in obtaining money for his northern charge that he had experienced in Wales. Anglesey was taken from him, and he was deprived of Roxburgh Castle in favour of his rival, the earl of Westmorland. The Scots again invaded England in the autumn of 1402, headed by the earl of Douglas and Murdoch Stewart, son of the duke of Albany. Northumberland and Hotspur barred their way at Millfield, near Wooler, and the Scots were compelled to fight at Humbleton, or Homildon Hill, on the 14th of September. The two armies met with a good result to the princes who made up the main body of the Scottish spearmen, and Hotspur was restrained from charging by his ally, George Dunbar, earl of March. The Scottish army was almost destroyed, while the English loss is said to have been five men. Disputes with the king arose over the disposal of the Scottish prisoners, Percy insisting on his right to hold Douglas as his personal prisoner, and he was summoned to court to explain. It is related that when he arrived Henry asked for Douglas, and Hotspur demanded in return that his brother-in-law, Edmund Mortimer, should be allowed to ransom himself from Owen Glendower, with whom he was a prisoner. High words followed, in the course of which Henry called Percy a traitor, struck him on the face, and drew his sword on him; Percy is said to have answered this defiance with the words, "Not here, but on the field." This was late in 1402, and in 1403 Hotspur issued a proclamation in Cheshire stating that he had killed King Henry IV. was absent or had turned to more immediate measures, as the time of his standard. He made common cause with his prisoner Douglas, and marched south to join forces with Glendower, who was now reconciled with Mortimer. He was reinforced by his uncle Thomas, earl of Worcester, who, although steward to the household of the prince of Wales, joined his family in rebellion. The mythical Richard II. was heard of no more, and Percy made himself the champion of the young earl of March. When he arrived at the Castle Foregate, Shrewsbury, early on the 21st of July, and demanded provisions, he found the king's forces had arrived before him. He retired in the direction of Whitchurch, and awaited the enemy about 33 m. from Shrewsbury. After a long parley, in which a truce of two days was even said to have been agreed on, the Scottish earl of March, fighting on the royal side, forced on the battle in the afternoon, the royal right being commanded by the prince of Wales. Hotspur was killed, the earls of Douglas and Worcester, Sir Richard Venables of Kinderton, and Sir Richard Vernon were captured, and the rebel army dispersed. Worcester, Venables and Vernon were executed the next day. Percy's body was buried at Whitchurch, but was disinterred two days later to be exhibited in Shrewsbury. The head was cut off, and fixed on one of the gates of York.

See Northumberland, Earls and Dukes of; and Percy, (Family), Also Chronique de la traison et mort de Richard II., ed. B. Williams (Eng. Hist. Soc., 1846); J. Creton, Histoire du roy Richard II., ed. John Webb, in Archaeologia (xx., 1824); and Adam of Breyton's History (Earls) as quoted by E. N. Macpherson in J. H. Wylie's England under Henry IV. (1884-1896), and Sir J. H. Ramsay's Lancaster and York (Oxford, 1892). Holinshed's Chronicle was the chief source of Shakespeare's account of Hotspur in Henry IV.

**PERCY, THOMAS** (c. 1596-1605), one of the Gunpowder Plot conspirators, was a son of Edward Percy of Beverley, who was grandson of Henry Percy, 4th earl of Northumberland. Though brought up a Protestant, he early became well-affected to the Roman Catholics and finally an adherent. He entered the service of his cousin, Henry Percy, 6th earl of Northumberland, who appointed him constable of Alnwick Castle, which he became agent for his northern estates, in which capacity he showed himself tyrannical and extortionate. In 1602 he was sent by Northumberland to James in Scotland to secure toleration for the Roman Catholics and returned announcing favourable promises from the king, the extent of which he probably greatly exaggerated; and when James, after his succession to the English throne, did not immediately abrogate the penal laws, Percy, although he had accepted the court appointment of gentleman pensioner, professed himself highly indignant and indulged himself in thoughts of revenge. Some time in May 1603 Percy angrily declared his intention to Catesby of killing the king, and in April 1604 he met Catesby with John Wright, Thomas Winter and Guy Fawkes, and was then initiated into Catesby's gunpowder plot, which met with his zealous approval and support. To Percy was allotted the special duty after the explosion of seizing the infant prince Charles and riding off with him on his saddle to Warwickshire. All the preparations being complete, Percy went to Alnwick in October and collected £3000 of the earl of Northumberland's rents which he intended using in furtherance of the plot, returning to London on the 1st of November. Meanwhile the plot had been revealed through the letter to Lord Montague on the 26th of October, and it was Percy's insistence at the last meeting of the conspirators on the 3rd that decided them not to fly but to hazard the attempt. On the news of Guy Fawkes's arrest, Percy with the rest of the conspirators, except Tresham, fled on horseback, taking refuge ultimately at Holbeche, near Stourbridge, in Staffordshire, where on the 8th of November, during the attack of the sheriff's men upon the house, he was struck down by a bullet, fighting back to back with Catesby, and died two days later. Percy married a sister of the conspirator John Wright and left a son Robert and two daughters, one of whom is said to have married Robert, the son of Catesby.

**PERCY, THOMAS** (1729-1811), bishop of Dromore, editor of the Percy Reliques, was born at Bridgnorth on the 13th of April 1729. His father, Arthur Lowe Percy, a grocer, was of sufficient means to send his son to Christ Church, Oxford, in 1746. He graduated in 1750 and proceeded M.A. in 1753. In the latter year he was appointed to the vicarage of Easton Maudit, Northamptonshire, and three years later was instituted to the rectory of Wilby in the same county, benefices which he retained until 1782. In 1750 he married Anne, daughter of Barton Gutteridge. At Easton Maudit most of the literary work for which he is now remembered—including the Reliques—was completed. When his name became famous he was made domestic chaplain to the duke and duchess of Northumberland, and was tempted into the belief that he belonged to the illustrious house of Percy. Through his patron's influence he became dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1782. His wife died before him in 1806; the good bishop, bland but otherwise in
sound health, lived until the 30th of September 1811. Both
were buried in the transept which Percy added to Dromore
Cathedral.

Dr. Percy's first work was a translation from a Portuguese
manuscript of a Chinese story, published in 1791. Two years
later he published *Five Pieces of Runic Poetry, translated from
the Islandic*. In 1763 he edited the earl of Summerv's poems
with an essay on early blank verse, translated the Song of Solomon,
and published a key to the New Testament. His *Northern
Antiquities* (1770) is a translation from the French of Paul Henri
Mallet. His reprint of *The Household Book of the Earl of Northum-
berland in 1532* is of the greatest value for the illustrations of
domestic life in England at that period. But these works are of
little estimation when compared with the *Reliques of Ancient
English Poetry* (1765). This was based on an old manuscript
collection of poetry, rescued by Percy in Humphrey Pitt's house
at Shifnal, Shropshire, from the hands of the housemaid who
was about to light the fire with it. The manuscript was edited in
its complete form by J. W. Hales and F. J. Furnivall in
1867-1868.

See A. C. C. Guassen, *Percy: Prolate and Poet* (1908). The
*Reliques* may have been edited by various hands, notably by H. B. Whe-
ley (1876). The fourth edition was by Percy's nephew, Thomas
Percy (1758-1808), himself a writer of verse.

**PERDICCAS**

is the name of three kings of Macedonia, who
reigned respectively c. 700 B.C., c. 454-413 B.C., and 364-359
B.C., and of one Alexander the Great's generals, son of Orontes,
a descendant of the independent princes of the province of
Orestis. The last named distinguished himself at the conquest
of Thebes (335 B.C.), and held an important command in the
Indian campaigns of Alexander. In the settlement made after
Alexander's death (323) it was finally agreed that Philip Arrhi-
daeus, an insane son of the great Philip, and Roxana's unborn
child (if a son) should be recognized as joint kings, Perdicas
being appointed, according to one account, guardian and regent,
according to another, chiliarch under Craterus. He soon showed
himself intolerant of any rivals, and acting in the name of the
two kings (for Roxana gave birth to a son, Alexander IV.)
sought to hold the empire together under his own hand. His
most loyal supporter was Eumenes, governor of Cappadocia
and Paphlagonia. These provinces had not yet been conquered
by the Macedonians, and Antigonus (governor of Phrygia,
Lycia and Pamphylia) refused to undertake the task at the
command of Perdicas. Having been summoned to the royal
presence to stand his trial for disobedience, Antigonus fled to
Europe and entered into alliance with Antipater, Craterus and
Ptolomy, the son of Lagus. Perdicas, leaving the war in Asia
Minor to Eumenes, marched to attack Ptolomy in Egypt. He
reached Pelusium, but failed to cross the Nile. A mutiny
broke out amongst the troops, disheartened by failure and
exasperated by his severity, and Perdicas was assassinated by
some of his officers (321).

See MACEDONIAN EMPIRE.

**PEREDA, JOSE MARIA DE** (1853-1906), one of the most
distinguished of modern Spanish novelists, was born at Polanco
near Madrid on the 6th of February 1853. He was educated at
the Instituto Cántabro de Santander, whence he went in
1872 to Madrid, where he studied with the vague purpose of
entering the artillery corps. Abandoning this design after
three years' trial, he returned home and began his literary career
by contributing articles to a local journal, *La Abaja montawa*
in 1858. He also wrote much in a weekly paper, *El Tio Cayetan*,
and in 1864 he collected his powerful realistic sketches of local life
and manners under the title of Escenas montawas. Pereda
fought against the revolution of 1868 in *El Tio Cayetan*, writing
the newspaper almost single-handed. In 1871 he was elected as
the Carlist deputy for Cabuerniga. In this same year he published
a second series of Escenas montawas under the title of
*Tipos y paisajes*; and in 1876 appeared *Bocetos del templo*,
three tales, in one of which the author describes his disenchanting
political experiences. The *Tipos trascumanentes* belongs to the
year 1877, as does *El Buey suelto*, which was intended as a reply
to the thesis of Balzac's work, *Les Petites misères de la vie con-
jugale*. More and more pessimistic to the political future of
his country, Pereda took occasion in *Don Gonzalo Gonzales
de la Gonzalera* (1879) to ridicule the Revolution as he had seen
it at work, and to pour scorn upon the nouveaux riches who
exploited Liberalism for their personal ends. Two novels by
his friend Pérez Galdés, *Doña Perceda y Gloria*, drew from
Pereda a reply, *De Tal caldo tal astilla* (1880), in which he ende-
vours to show that tolerance in religious matters is disastrous
alike to nations and to individuals. The *Esbozos y rasgados*
(1881) is of lighter material, and is less attractive than *El Sabor
de la Tierruca* (1882), a striking piece of landscape which won
immediate appreciation. New ground was broken in *Pedro
Sánchez* (1883), where Pereda leaves his native province to
portray the disillusion of a sincere enthusiast who has plunged
into the political life of the capital. Pereda's masterpiece is
*Solitaria* (1884), a vigorous rendering of marine life by an artist
who perceives and admires the daily heroisms of his fisher-folk.
It has often been alleged against the author that he confines
himself to provincial life, to lowly personages and to unrefined
subjects, and no doubt an anxiety to clear himself from this
absurd reproach led him to attempt a description of society at
the capital in *La Montadisa* (1888), which is certainly the least
successful of his works. In the next year (1889) he returned to the
marine subjects which he knew and loved best. Again, in *Peras
driba* (1895), the love of country life is manifested in the masterly
contrast between the healthy, moral labour of the fields and the corrupt,
squalid life of cities. Pereda's fame was now established; the statutes of the Spanish
Academy, which require members to reside at Madrid, were
suspended in his favour (1896). But his literary career was
over. The tragic death of his eldest son, the disastrous
campaign in Cuba and the Philippines, darkened his closing years,
and his health failed long before his death at Polanco on the
1st of March 1906.

Pereda belongs to the native realistic school of Spain, which
was founded by the unknown author of *Lazarillo de Tormes*, was
continued by Meteo Alemán, Cervantes, Quevedo, Castillo
Solórzano and many others. With the single exception of
Cervantes, however, the picaronesque writers are almost entirely
burnt in the service of generous sympathy and tenderness
which constitutes a great part of Pereda's charm. His realism
is purely Spanish, as remote from Zola's morososity as from
the graceful sentimentality of Pierre Loti. Few 19th-century
writers possessed the virile temperament of Pereda, and, with
the single exception of Tolstoy, none kept a moral end more
steadily in view. This didactic tendency unquestionably injures his effects. Moreover, his grim satire occasionally
degenerates into somewhat truculent caricature, and the exces-
sive use of dialect and technical terms (which caused him to
supply *Solitaria* with a brief vocabulary) is a grave artistic
blemish. But he saw, knew, understood character; he created
t not only types, but living personages, such as Andrés, Cleto
and Muñoz in *Solitaria*, Pedro Juan and Filara in *La Puchera*;
and he personified the tumult and calm of the sea with more
power than Victor Hugo displayed in *Les Travailleurs de la
Mer*. His descriptive powers were of the highest; order, and
his style, pure of all affectations and embellishments, is of singular
force and suppleness. With all his limitations, he was as
original a genius as Spain produced during the 19th century.

(J. F.-K.)

**PÈRE DAVID'S DEER**, the mi-loü of the Chinese, an aberrant
and strangely mule-like deer (q.v.), the first evidence of whose
existence was made known in Europe by the Abbé (then Père)
David, who in 1865 obtained the skin of a specimen from the
herd kept at that time in the imperial park at Pekin. This
skinned, with the skull and antlers, was sent to Paris, where it was
described in 1866 by Professor Milne-Edwards. In lacking a
brow-tine, and dividing in a regular fork-like manner some distance
above the burr, the large and cylindrical antlers of this species
conform to the general structural type characteristic of the
American deer. The front prong of the main fork, however,
PEREGRINUS PROTEUS—PEREYASLAVI.

PEREGRINUS PROTEUS (2nd cent. a.d.), Cynic philosopher, of Parium in Mysia. At an early age he was suspected of parricide, and was obliged to leave his native place. During his wanderings he reached Palestine, where he ingratiated himself with the Christian community, and became its virtual head. His fanatical zeal and craving for notoriety led him to imprisonment, but the governor of Syria let him go free, to prevent his posing as a martyr. He then returned to Parium to claim his paternal inheritance, but finding that the circumstances of his father's death were not yet forgotten, he publicly surrendered all claims to the property in favour of the municipality. He resumed his wandering life, at first assisted by the Christians, but having been detected profaning the rites of the Church, he was excommunicated. During a visit to Egypt he made the acquaintance of the famous Cynic Agathobulus and joined the sect. Meeting with little encouragement, he made his way to Rome, whence he was expelled and returned to Parium. Crossing to Greece, he finally took up his abode at Athens. Here he devoted himself to the study and teaching of philosophy, and obtained a considerable number of pupils, amongst them Aulus Gellius, who speaks of him in very favourable terms. But, having given offence by his attacks on Herodes Atticus and finding his popularity diminishing, he determined to create a sensation. He announced his intention of immolating himself on a funeral pyre at the celebration of the Olympic games in 165, and actually carried it out. Lucian, who was present, has given a full description of the event.

PEREIRE [Pereira], GIACOBO RODRIGUEZ (1715-1780), one of the inventors of deaf-mute language, a member of a Spanish-Jewish family, was born at Estremadura, Spain, on the 11th of April 1715. At the age of eighteen he entered a house of charity. Here he was instructed in various languages, who had been dumb from birth, and henceforth devoted himself to discover a method of imparting speech to deaf-mutes. His first subject was Aaron Baumann, a co-religionist, whom he taught to enunciate the letters of the alphabet, and to articulate certain ordinary phrases. He next devised a sign alphabet for the use of one hand only, and in 1749 he brought his second pupil before the Paris Academy of Sciences, the members of which were astonished at the results he had accomplished. In 1759 Pereire was made a member of the Royal Society of London. He died at Paris on the 15th of September 1780.

PEREIRE, a town of Russia, in the government of Taurida, 60 m. S.E. of Kherson, on the Crimean Inland Sea, the isthmus which connects the Crimean peninsula with the continent, and the line of the defensive ditch and dike which crosses from the Black Sea to the Dnieper (putrid) lagoon. Pop. about 5000. It was formerly an important place, with a great transit trade in salt, obtained from salt lakes in the immediate neighbourhood. Since the opening of the railway route from Kharkov to Simferopol in the Crimea Pereirsk has greatly declined. In ancient times the isthmus was crossed (about 1½ m. south of the present town) by a ditch which gave the name of Taphros to a Greek settlement. This line of defence having fallen into decay, a fort was erected and a new ditch and dike constructed in the 15th century by the Tatar Khan of the Crimea, Mengli Ghairi, and by his son and successor Sahib Ghairi. The fort, known as Kapu or Or-Kapu, became the nucleus of the town. In the middle ages Pereirsk was known as Tuzla. In 1736 it was captured by the Russians under Münnich, and again in 1738 under Lascy (Lacy), who blew up the fort and destroyed a great part of the dike. In 1754 the fort was rebuilt by Krim Ghairi; but the Greek and Armenian inhabitants of Pereirsk formed a new settlement at Armanyisky Bazar (Armenian Market), 3 m. farther south. Capitated by the Cossacks in 1779, Pereirsk was turned over to Russian possession with the rest of the Crimea in 1783.

PEREYASLAVL, a town of Russia, in the government of Poltava, 26 m. S.E. of the city of Kiev, at the confluence of the Trubezh and the Alta, which reach the Dnieper 5 m. lower down at the town's port, the village of Andruski. Pop. 14,609. Besides the town proper there are three considerable suburbs. Though founded in 993 by Vladimir the Great of Moscow in memory of his signal success over the Turkish Pechenegs, Pereyaslavl has now few remains of antiquity. The town has a square in grain, salt, cattle and horses, and some manufactures—tallow, &c.

From 1054 Pereyaslavl was the chief town of a separate principality. As a southern outpost it often figures in the 11th, 12th and 13th centuries, and was plundered by the Mongols in 1239. In later times it was one of the centres of the Cossack movement; and in 1628 the neighbourhood of the town was the scene of the extermination of the Polish forces known as "Tara's Night." It was by the Treaty of Pereyaslavl that in 1654 the Cossack chieftain Bogdan Chmielnicki acknowledged the supremacy of Tsar Alexis of Russia.

PEREYASLAVL (called Zaleskiy, or "Beyond the Forest," to distinguish it from the older town in Poltava after which it was named), one of the oldest and most interesting cities in middle Russia, situated in the government of Vladimir, 45 m. N.E. of Moscow on the road to Yaroslavl, and on both banks of the Trubezh near its entrance into Lake Pleshcheyevo. Pop. 8662. Pereyaslavl was formerly remarkable for the number and importance of its ecclesiastical foundations. Among those still standing are the 12th-century cathedral, with ancient vestiges and the grave of Demetrius, son of Alexander Nevsky, and other churches as a church founded by Eudoxia (Euphrosyne), wife of Demetrius Donskoj, in the close of the 14th century. It is by its extensive cotton manufactures that Pereyaslavl is now best known. The fisheries in the lake (20 m. sq. in extent and 175 ft. deep) have long been of great value.

Founded in 1512 by Yury Dolgorukii, prince of Suzdal, Pereyaslavl soon began to play a considerable part in the history of the country. From 1515 till 1532 it had princes of its own; and the princes of Moscow, to whom it was at the latter date.
bequeathed, kept it (apart from some temporary alienations in the 14th century) as part of their patrimony throughout the 15th and 16th centuries. Lake Pleshchëvo was the scene of Peter the Great's first attempts (1691) at creating a fleet.

PÉREZ, ANTONIO (c. 1540–1611), for some years the favourite minister of Philip II of Spain and afterwards for many more the object of his unrelenting hostility, was by birth an Aragonese. His relations were that which the 17th-century publicist, Gonzalez Perez, an ecclesiastic, has some place in history as having been secretary both to Charles V. and to Philip II, and in literature as author of a Spanish translation of the Odyssey (La Ulyssce de Homero, Antwerp, 1556). Antonio Perez, who was legitimated by an imperial diploma issued at Valladolid in 1542, was, however, believed by many to be in reality the son of Philip's minister, Ruy Gomez de Silva, prince of Eboli, to whom, on the completion of a liberal education at home and abroad, he appears at least to have owed his first introduction to a diplomatic career. In 1567 he became one of the secretaries of state, receiving also about the same time the lucrative appointment of protonotary of Sicily, and in 1573 the death of Ruy Gomez himself made room for Perez's promotion to be head of the "despacho universal," or private bureau, from which Philip attempted to govern by assiduous correspondence the affairs of his vast dominions. Another of the king's secretaries at this time, though in a less confidential relation, was a friend and contemporary of Perez, the poet Perez de Escovedo, who, however, after the fall of Tunis in 1574, was sent off to supersede Juan de Soto as secretary and adviser of Don John of Austria, thus leaving Perez without a rival. Some time after Don John's appointment to the governorship of the Netherlands Perez accidentally became cognisant of his inconveniently ambitious "empres de Inglatera," in which he was to rescue Mary Queen of Scots, marry her, and so ascend the throne of England. The next step might even be against Spain itself. This secret scheme the faithful secretary at once carried to Philip, who characteristically resolved to meet it by quietly removing his brother's aider and abotor. With the king's full cognisance, accordingly, Perez, after several unsuccessful attempts to poison Escovedo, succeeded in procuring his assassination in a street of Madrid on the 31st of March 1578. The immediate effect was to raise Perez higher than ever in the royal confidence and favour, but, wary though the secretary was, he knew not how wholly to sever himself of his connexion with the crime, and very soon a prosecution was set on foot by the representatives of the murdered man. For a time Philip was both willing and able to protect his accomplice, but ultimately he appears to have listened to those who, whether truly or falsely, were continually suggesting that Perez had had motives of his own, arising out of his relations with the princess of Eboli, for compassing the assassination of Don John's secretary; be this as it may, from trying to screen Perez the king came to be the secret instigator of those who sought his ruin. The process, as such matters often have been in Spain, was a slow one, and it was not until 1580 that Perez, after more than one arrest and imprisonment on a variety of charges, seemed on the eve of being convicted and condemned as the murderer of Escovedo. At this juncture he succeeded in making his escape from prison in Castile into Aragon, where, under the ancient "fueros" of the kingdom he could claim a privilege of open court, and so bring into requisition the documentary evidence he possessed of the king's complicity in the deed. This did not suit Philip, who, although he instituted a process in the supreme tribunal of Aragon, speedily abandoned it and caused Perez to be attacked from another side, the charge of heresy being now preferred, arising out of certain reckless and even blasphemous expressions Perez had used in connexion with his troubles in Castile. But all attempts to remove the accused from the civil prison in Saragossa to that of the Inquisition raised popular tumults, which in the end led to Perez's escape across the Pyrenees, but unfortunately also furnished Philip with a pretext for sending an army into Aragon and suppressing the ancient "fueros" altogether (1591). From the court of Catherine de' Medici, at Paris where Perez was persuaded to go by that of Henry IV, of France, and both there and in England his talents and diplomatic experience, as well as his well-grounded enmity to Philip, secured him much popularity. While in England he became the "intimate coach-companion and bed-companion" of Francis Bacon, and was also much in the society of the earl of Essex. The peace of Vervins in 1598 greatly reduced his apparent importance abroad, and Perez now tried to obtain the pardon of Philip III., that he might return to his native country. His efforts, however, proved vain, and he died in comparative obscurity in Paris on the 3rd of November 1611.

Perez's earliest publication was a small quarto, dedicated to the earl of Essex, written and apparently printed in England about 1611 (Petrus Perrezus, Philippi II. Praeclarissimi Principis, adornat at P. Leon). A Dutch translation appeared in 1594, and in 1598 he published his Relaciones, including the Memoria del hecho de su causa, drawn up in 1596, and many of his letters. Much has been done by Mignet (Antonio Perez et Philippe II. 1845; 4th ed, 1871); by Froude (An Unsolned Historical Riddle; Nineteenth Cent., 1883) among others, towards the elucidation of various difficult points in Perez's somewhat perplexing person. For the matter of Escovedo, Andrew and Hume's discussion of it in their Historical Mysteries (1904); and the Españoles e Ingleses (1903) of Martin Hume, who had access to various newly discovered MSS.

PÉREZ GALDÓS, BENITO (1845— ), was born at Las Palmas, in the Canary Islands, on the 10th of May 1845. In 1863 he was sent to Madrid to study law, drifted into literature, and was speedily recognized as one of the most promising recruits on the Liberal side. Shortly after the Revolution of 1868 he abandoned journalism, and employed fiction as the vehicle for propagating advanced opinions. His first novel, La Fontana de oro, was printed in 1871, and later in the same year appeared El Andalus. The reception given to these early essays encouraged the writer to adopt novel-writing as a profession. He had already determined upon the scheme of his Episodios nacionales (1873), and the first volume of this work was published in collaboration with the Caballéro humain, Old charters, old letters, old newspapers were collected by him with the minuteness of a German archivist; no novelist was ever more thoroughly equipped as regards the details of his period. Tragalgar, the first volume of the Episodios nacionales, appeared in 1879; the remaining books of this first series are entitled La Cort de Carlos IV., El 19 de marzo y el 2 de mayo, Bailén, Napoleón en Charnatin, Zaragoza, Gerona, Cádiz, Juan Martín el Empecinado and La Batalla de Arpiles. As the titles suffice to show, the author's aim was to write the national epic of the 19th century in prose; and he so completely succeeded that, long before the first series ended in 1881, he took rank among the foremost novelists of his time. A second series of Episodios nacionales, beginning with El Equipoje del rey José and ending with a tenth volume, Un Faccioso más y algunas frailes menos, was brought to a close in 1883, and was, like its predecessor, a movement of inquiry and exact knowledge, of realism and romantic conception; and he carried on the Episodios nacionales into a fourth series, raising the total of volumes to forty. In fecundity and in the power of creating characters, Pérez Galdós vies with Balzac. Parallel with his immense achievement in historical fiction, Pérez Galdós published a collection of romances dealing with contemporary life, its social problems and religious difficulties. Of these the best known, and perhaps the best, are Doña Perfecta (1876); Gloria (1877); La Familia de León Roch (1878); Marianela (1878); Fortunata y Jacinta (1887); and Angel Guerra (1891). Nor does this exhaust his prodigious activity. Besides adapting several of his novels for stage purposes, he wrote original dramas such as La Loca de la Casa (1863), San Quintín (1894), Eletra (1900) and Mariuca (1904); but his diffuse, exuberant genius
PERFUMERY

was scarcely accommodated to the convention of theatrical form. Pérez Galdós became a member of the Spanish Academy, and was also elected to the Cortes; but it is solely as a roman-
cratic humorist that his name is familiar wherever Spanish is spoken,
as a national novelist of fertile talent, and a most happy
mystlst, who in his eccentries and oddities is hardly inferior
to Dickens.

PERFUMERY (Lat. per, through, and fumare, to smoke), the
preparation of perfumes, or substances which are pleasing to
the sense of smell. Perfumes may be divided into two classes,
the first of which includes all primitive or simple odoriferous bodies
derived from the animal or vegetable kingdom, as well as the
definite chemical compounds specially manufactured, while
the second comprises the various " bouquets " or " mélanges 
made by blending two or more of the foregoing in varying
proportions—oilet powders, dentifrices, sachets, &c. To
the former class belong (1) the animal products, ambergris, castor,
civet, musk; (2) the essential oils (also called attars), mostly
procured by the distillation of the stems, leaves, flowers and other
parts of plants; (3) the phialic butters or oils, which are
either solid or liquid fats charged with odours by the processes
of infiltration (enfleurage), or maceration; (4) the odorous gum-resins
or balsams which exude naturally or from wounds in the trunks
of various trees and shrubs, such as benzoin, opoponax, Peru, Tolu,
storax, myrrh; (5) the large number of synthetic perfumes
which simulate the odour of the natural scents. The second
class contains the endless combination of tinctures sold under
fancy names which may or may not afford a clue to their composition,
such as " comédie française," " eau de senteur," " eau de
Cologne," "lavage ambrée," "blumengeist." In general,
they are mixtures of a number of perfumes dissolved in alcohol.
Strictly speaking, most of the perfumes on the market belong to
the second class, since, in most cases, they are prepared by
blending various natural or artificial odorous principles.

Natural Perfumes.—The animal perfumes are extremely limited
in number. Ambergris (q.v.), one of the most important,
is secreted by the sperm whale; musk (q.v.), the best known
scent of this class, is secreted by the male musk-deer and other
animals—musk-ox, musk-rat, &c.; civet (q.v.) is a musky scent
named from the animal which secretes it; and castor or castoreum
is a somewhat similar secretion of the beaver (q.v.).
More important are the scents yielded by flowering plants. As
a general rule fragrant flowers flourish in hot climates, but the more
delicate perfumes are yielded by plants having a colder habitat;
it must be remembered, however, that some costly perfumes
are obtained from the plants of Ceylon, the East Indies, Mexico
and Peru. In Europe, Grasse, Cannes and Nice are the centres
of the natural perfume industry. Cannes is famous for its rose,
acacia, jasmine and neroli oil; Nîmes for its thyme, rosemary
and lavender; and Nice for its violets. Citron and orange oil
come from Sicily; iris and bergamot from Italy; and roses are
extensively cultivated in Bulgaria, and in European Turkey.
England is unsurpassed for its lavender and peppermint, which
flourish at Mitcham and Hitchin.

The natural scents of the attars or essential oils are the
different parts of the plants which yield them—the wood (lign,
aloë, santal, cedar), the bark (cinnamon, cascarilla), the leaves
(patchouli, bay, thyme), the flowers (rose, lavender, jasmine
blossom), the fruit (nutmeg, citron), or the seeds (caraway,
almond). Some plants yield more than one, such as lemon and
bergamot. They are mostly obtained by distilling that part of
the plant in which they are contained with water, or with high-
pressure or superheated steam; but some few, as those from the
rind of bergamot (from Citrus bergamia), lemon (citron zeste,
from C. Limonum), lime (C. Limetta), by " expression."
The outer layer of the cortex is rapped off from the unripe fruits,
the raspings placed in a canvas bag, and squeezed in a screw
or hydraulic press. The attars so obtained are separated from
the admixed water by a tap-funnel, and then filtered.
Certain flowers, such as jasmine, tuberose, violet, cassia, either
do not yield their attars by distillation at all, or do it so sparingly
as not to admit of its collection for commercial purposes; and
sometimes the attar, as in the case of orange (neroli), has an
odour quite different from that of the fresh blossoms. In these
cases the odours are secured by the processes of infiltration
(enfleurage) or by maceration. Both depend upon the remark-
able property which fats and oils possess of absorbing odours.
Enfleurage consists in laying the leaves or flowers on plates
covered with a layer of fat. The flowers are renewed every
morning, and when the fat has sufficient odour it is scraped off,
melted and strained. Maceration consists in soaking the flowers
in heated fat; in due time they are strained off and replaced
by fresh ones, as in the enfleurage process. The whole of
the necessary meltlings and heatings of the perfumed greases are
affected by means of water-baths, whereby the temperature
is kept from rising too high. For the manufacture of perfumes
for the handkerchief the greases now known as pomades, butters
or phlicoimes are treated with rectified spirit of wine 60°
proof, i.e. containing as much as 95% of absolute alcohol by
volume, which practically completely abstracts the odour.

The gum-resins and resins have been employed as perfumes
from the earliest times. The more important are incense,
frankincense and myrrh (q.v.). They are largely used in
the preparation of perfumes, pomades, pomatum; the amber
of Bruges, and other similar perfumes.

Synthetic Perfumes.—Under this heading are included all
perfumes in which artificial substances are odorous ingredients.
Although the earliest perfumes of this class were introduced in
about the middle of the 19th century, the important industry
which now prevails is to be regarded as dating from the 'seventies
and 'eighties. Three main lines of development may be distin-
guished: (1) the chance discovery of substances which have
odours similar to natural perfumes; (2) the elucidation of
the composition of the natural scents, and the chemical constitution
of their ingredients, followed by the synthetic preparation of
the substances so determined; and (3), which may be regarded
as connected with (2), the extraction and separation of the
essential oils yielded by less valuable plants, and their reblending
to form marketable perfumes.

The first synthetic perfume was the " essence of Mirbane 
introduced by Collas in about 1850; this substance was the
nitro-benzene discovered by E. Mitscherlich in 1834. Soon after
wards many esters of the fatty acids simulating the odours of
fruits were introduced; and in 1888 Baur discovered the " arti-
ficial musks," which are derivatives of s-trinitrobenzene.
The above are instances of the first line of progress. The second line
has for early examples the cases of artificial oil of wintergreen,
which followed Cahun's discovery that the natural oil owed its
odour, in the main, to methyl salicylate, and of artificial oil of
bitter almonds which followed the preparation of benzaldehyde
from benzal chloride in 1868. The synthesis of coumarin, the
odorous principle of hay and woodruff, by Sir W. H. Perkin in
1868; of vanillin, the odorous principle of vanilla, by F. Tiemann
and W. Haarmann in 1875; and of ionone, almost identical with
the natural irone, the odorous principle of violets, by
Tiemann and P. Krüger in 1890, are to be regarded as of the
highest importance. Equally important are the immense strides made in the elucidation of the constitution and syntheses of the terpenes (q.v.), a group of compounds which are exception-
ally abundant as odorous principles in the essential oils.

The present state of our knowledge does not permit a strict
parallel of odour and chemical constitution. One theory regards
odour as due to " osmophores," or odour-producing groups, in
much the same way as colour is associated with chromophores.
Such osmophores are hydroxyl (OH), aldehyde (CHO), ketone (CO), ether (-O-), nitrile (CN), nitro (NO2), &c.;
we may also notice the isonitrile group (-NG) associated with
an unpleasant odour, and the iso-thiocyanate group (-NCS) to
which the mustard oils owe their characteristic smell. The same
group, however, is not invariably associated with the same odour,
or even any odour at all, as, for instance, in such closely related
compounds as the members of a homologous series. For example, the lower fatty aldehydes have unpleasant odours, those with ten carbon atoms (and also double linkages, which in itself may affect odour) form some of the most delicate scents, while the higher members are odourless. The absence of odour in the higher members may be possibly associated with the low volatility exhibited by compounds of high molecular weight. Certain osmophores have practically equal effects; for example, benzaldehyde, nitrobenzene, benzonitrile, and phenyl azoimide have practically identical odours, and among the "artificial musks," a nitro group may be replaced by the azoimido group without the odour being modified. As a general rule, homologues have similar odours, but many exceptions are known. For example the methyl and ethyl ethers of 2-carbethoxy ketone have the same odour of neroli; on the other hand, the esters of antranilic acid, the methyl has the odour of orange blossoms, the ethyl has a slight odour, and the isobutyl is odourless. The introduction of a methyl group into the benzene ring generally involves little or no change in odour; but when it (and more generally higher alkyl radicals) is introduced into side chains the odour may be entirely changed. For example, benzene and its homologues have similar odours; phthalide is odourless, but the isopropyl and butyl phthalides, in which substitution occurs in the side chain, smell of celery. Especially characteristic are the derivatives of phenylacetylene. This hydrocarbon is distinctly unpleasant; on the other hand, para-ethyl and para-methyl phenylacetylene smell of anise. While the triply-linked carbon system is generally associated with strong and unpleasant odours, the doubly linked system gives pleasant ones. Thus the unpleasant phenylacetylene, C₆H₅C(=CH₂), is contrasted with styrene, C₆H₅-CH=CH₂, which occurs in storax, and phenylpropionic aldehyde with cinnamic aldehyde, C₆H₅CH=CHCHO, which occurs in cassia and cinnamon. The reduction of a double to a single linkage may not destroy odour. Thus hydrocinnamic aldehyde, the reduction product of cinnamic aldehyde, smells of jasmine and lilac, and melilotin, which occurs in yellow melilotus (Melilotus officinalis), has the same odour (woodruff) as its oxidation product coumarin. The orientation of the substituent groups in the benzene nucleus also affects odour. In general, the meta compounds are odourless, while the ortho and para may have odour. Thus 3-methoxyacetophenone has a pleasant odour, the meta compound is odourless, 2-hydroxyacetophenone, 2-aminoanisole, and 2-nitropheno1 have strong odours, while the meta and para bodies are odourless. Of the three trinitrobenzenes only the symmetrical form gives origin to perfumes.

The concentration and even the solvent has considerable effect on the odour of a substance. Many of the artificial principles—vanillin, heliotrope, ionone, &c.—have very different odours in strong and in dilute solution; phenyl acetic acid and 2-naphthylamine are odourless when solid, but have disagreeable odours when dissolved. Traces of impurities often have the effect of making otherwise odourless or pleasant-smelling compounds quite intolerable. Acetone, as a general example, calcium carbide, and carbon disulphide prepared from its elements are quite intolerable, though when pure they are, at least, not unpleasant; artificial benzaldehyde must be very carefully purified before it can be used in the preparation of the more delicate scents. In all cases the natural scents are complex mixtures of many ingredients, and a variation in the amount of any one may completely alter the scent. Such mixtures would be difficult to reproduce economically; the perfumer is content with a product having practically an identical odour, with or without the natural substance which it is designed to compete with.

We now give an account of the artificial scents, principally arranged according to their chemical relations. The fatty esters are interesting as providing many of the fruit essences; in fact, by appropriate blending, any fruit odour can be reproduced. Their use, however, is inhibited by the fact that they irritate the respiratory organs, producing coughing and headaches. Isobutyric carbinol acetate ester (amyl acetate), \( \text{C}_{3}\text{H}_{2} \text{CH}-\text{CH}_{2}-\text{CH}_{2}-\text{OC-CH}_{3} \) forms when in dilute alcoholic solution the artificial pear oil; a similar odour is possessed by isoamyl-n-butylate, \( \text{C}_{3}\text{H}_{7}-\text{OC-CH}_{3} \)

---

### Name of Oil | Source | Constituents
---|---|---
Anise | Pimpinella anisium | Anethole, estragole.
Bay | Pimenta acri | Eugenol, methyl eugenol, charavyl, estragole, myrcene, piperitone.
Bergamot | Citrus bergamia | Linalol, linalyl acetate, d-limonene, bergapten.
Cajaput | Melaleuca, sp. | Cineol.
Cassia | Cinnamomum cassia | Cinnamon, cinnamyl alcohol.
Caraway | Carum carvi | Carone, d-limonene.
Camphor | Pinus carvifolia | Camphene, phellandrene, terpinolene, eugenol, safrole.
Chamomile | Anthemis nobilis | Isobutyl and isopinyl esters of angelic and tiglic acids.
Cinnamon | Cinnamomum Zeylanicum | Cinnamonaldehyde.
Clove | Eugenia caryophyllata | Eugenol, Linalol.
Coriander | Coriandrum sativum | Linalol, linalyl acetate.
Cumin | Cuminum cuminum | Menthol, eugenol.
Eucalyptus | Eucalyptus globulus | Menthol, eugenol.
Fennel | Foeniculum vulgare | Methylnitrane, indole, benzyl alcohol, benzy1 acetate, linalol, linalyl acetate.
Ginger | Zingiber officinalis | Linalol, linalyl acetate.
Jasmine | Jasminum grandiflorum | Menthone, phellandrene, citrol, geraniol, geranyl acetate, linalol.
Lavender | Lavandula spica | Menthol, menthone acetate.
Lemon | Citrus limon | Menthol, menthone acetate.
Lemon-grass | Andropogon citratus | Menthol, linalool.
Neroli | Citrus bigaradia | Linalool, linalyl acetate.
Orange | Citrus aurantium | Linalool.
Peppermint | Mentha piperita | Linalool.
Pine-needle | Pinus sylvestris | Linalool.
Rose | Rosa damascena | Menthol, linalool.
Geranium | Pelargonium odoratus | Menthol, linalool.
Rosemary | Rosemarinus officinalis | Menthol, menthone acetate.
Sage | Salvia officinalis | Menthol, linalool.
Sassafras | Sassafras officinalis | Menthol.
Spearmint | Mentha viridis | Menthol.
Star anise | Illicium anisatum | Menthol.
Tansy | Tanacetum vulgare | Menthol.
Thyme | Thymus vulgaris | Menthol.
Wormwood | Artemisia absinthium | Menthol.
Ylang-ylang | Cananga odorata | Menthol.

---

1 See J. B. Cohen, Organic Chemistry, p. 532; or J. Parr, Chemistry of Perfumes (1908).

The chief benzenoid compounds used as perfumes are aldehydes, oxacyclaldehydes, phenols and phenol ethers. Benzaldehyde has the odour of almonds, cinnamic aldehyde of cinnamon, and cumin aldehyde gives the odour to cumin oil. Of oxacyclaldehydes salicylaldehyde and its derivatives are used in toilet preparations. The odorant ingredient of vanilla (g.v.) is anisaldehyde smells like Hawthorn, and is extensively used under the name uabépine for scenting soaps and extracts. Carvacrol and thymol are isomeric methyl propyl phenols, the former of which (allyl guaiacol) has the odour of cresol, and anethole (allyl phenyl methyl ether) is the chief constituent of anise oil, being chiefly used in the manufacture of liqueurs. Several piperonyls are odoriferous; of these, the odour of the 3-methyl-2-piperonal, which has the odour of heliotrope, an allyl derivative, salmol CH₂OH·C₆H₄·CH₃(1,2,4), occurs in sasasfas, while apiole or dimethoxy satriole has the odour of persley oil. Of other synthetic perfumes amyl salicylate is used under the names of orchidette or odorofrang. It is the basis of many perfumes, in particular of artificial notes; methyl anthranilate occurs in the natural neroli oil and other oils, and has come into considerable use in the preparation of artificial bergamots, neroli, jasmine and other perfumes (the Trofane, Mayence, and Augsburg names are often given to this product). Paracitral (q.v.) have this property. Two artificial musks are derivatives of 2-tritrobenzenes; coumarin is the principle of woodruff; and β-naphthyl methyl ether is used for the preparation of artificial apple, peach, and rose notes.

The Odophone.—The most important element in the perfumer’s art is the blending of the odorous principles to form a mixture which gratifies the sense of smell. Experience is the only guide. It is in the nature of the odour of each constituent to some extent to conceal the odour of the others, and the strength of its components. Septimus Piesse endeavoured to show that a certain scale or gamut existed amongst odours as amongst sounds, taking the sharp smells to correspond with high notes and the heavy smoky or earthy odours to the low.

How should the odours be distributed in this manner, mixing each to correspond with a certain note, one-half in each clef, and extending above and below the lines. For instance, treble clef note C (4th space) corresponds with note D (treble clef note D), and with note F (4th space above clef) with ambergries. It is readily noticed in practice that ambergries is much sharper in smell (higher) than violet, while Portuguese is intermediate. He asserted that properly to contrive a mixture of odours which should harmonize in the gamut like the notes of a musical chord—one false note among the odours as among the music destroying the harmony. Thus on his odophone, santal, geranium, acacia, orange-flower, camphor, and then triple chords (the first and second line, C (base 2nd space), E (treble 1st line), G (treble 2nd line), C (base 3rd space), constitute the bouquet of chord C.

Other Branches of Perfumery.—As a natural outcome of the development of the perfume industry, scented articles for toilet and other uses are now manufactured in large quantities. Thus soaps, toilet powders, tooth powders, hair-washes, cosmetics generally, and note-papier have provided material on which the perfume worker has been able to dwell. The introduction of scented soaps two methods are in use: both start with soap, and the odour and its odour to the presence of resin, or of curd soap (which is hard, white and odourless), and is prepared without resin. In one process the soap is melted by superheated steam, and then still further melted by the simultaneous fusing of an oil with an iron cross-bar, technically called a “crutch,” with the attars and the colouring matter. It is then removed from the melting pan to a rectangular iron mould or box, the sides of which can then be removed by steel edges, and when the box is opened, to the surprise of all observers, the cold mass is cut into slabs and bars with a thin brass wire. In the other or cold process the soap is first cut into chips or shavings by a plane or a “chipping machine,” then the colouring matters are added, the soap is thoroughly incorporated with them by mixing and stripping it; the melted soap is then again poured into the moulds, which form a continuous sheet but with thicker than paper. The perfumes are then added, and after standing for about twelve hours the soap is again sent through the roll to be cut into bars, called *en tret qui.* From which it emerges as a continuous bar almost as hard as wood. Soap thus worked contains less than 10% of water; that prepared by melting contains 20 and even 30%. The amount of perfume added, as a rule, is the odour of the essence, and the qualities of about 7 or 8%. The finest soaps are always manufactured by the cold process.

Toilet Powders are of various sorts. They consist of rice-starch or wheat-flour, or corn-flour, or some powdered organic or inorganic substance mixed with or without the addition of zinc oxide, bismuth oxide or French chalk. The constituent powders, after the addition of the perfume, are thoroughly incorporated and mixed by sieving through a fine sieve, or in the form of a mist. For the face, the powder might consist of powdered violet root (Iris florentina), from the odour of which the powder is named. It is of a yellowish tint, soft and pleasant to the touch. The white common so-called “violet powders” consist of starch scented with bergamot, and are in every sense inferior.

Tooth Powders consist for the most part of mixtures of powdered orris-root with precipitated chalk, and some of the constituent destined to particularize it as to properties or flavour, such as charcoal, finely pulverized pumice, quassia, sugar, camphor, &c. The perfume of the contained orris-root is modified, if required, by the addition of a little of some perfume. Tooth Pastes are formed of the same constituents as the powders, and are worked into a paste by the addition of a little honey or glucose syrup, which substances are usually believed ultimately to have an injurious effect on the teeth.

Perfume Sachets consist either of a powder composed of a mixture of flower petals, nuts, Brazil nuts, bones, &c., and other predominating as required, contained in an ornamental silk sac; or of some of the foregoing substances spread upon card or chamois leather or flannel after being made into a paste with mucilage and a little glycercin. Any of the perfumes of the preceding paragraphs are employed as required in the manufacture of good quality these cards, known as "peu d’Espangne" sachets, retain their odour unimpaired for years.

Adulterations.—There is, as might be expected, considerable scope for the introduction of the perfumery of common materials employed in perfumery. Thus, in the case of musk, the "pods" are frequently found to be partially emptied of the grain, which has been replaced by hide or skin, while the weight has been increased by the addition of a little flour, talc, or rice. The white of eggs is readily covered with various powdered silks for sale. Where the ingredients employed in their manufacture are of good quality these cards, known as "peu d’Espangne" sachets, retain their odour unimpaired for years.

BIBLIOGRAPHY.—See generally, J. C. Sawyer, Odorographia, vol. i. (1892). For the Chemistry of Perfumery, see the works of Bertrand, Bertrand and Hecker, and Hubert. The preparation of Perfumes is described in the special works on the subject. A standard work on the essentials is given in the article Oils. G. H. "Die Riechstoffe" (1904), treats the chemistry, and in the "Handbuch der chemischen Technologie" (1910), the physiology of perfumes. See also the reports and bulletins of the Council of Perfumes and Roue Bertrand et Fils.

PERGA (mod. Murtana), an ancient city of Pamphylia, situated about 8 m. inland, at the junction of a small stream (Sari Su) with the Cestrus. It was a centre of native influences as contrasted with the Greek, which were more predominant in Attalia, and it was a great seat of the worship of "Queen" Artemis, here represented as a human-headed cone and a purely Anatolian nature goddess. There Paul and Barnabas began their first Christian mission, and are named by Clemens Rom. i. 3. It was a much frequented route into Phrygia and the Maeander valley and became a bishopric. Perge, and Alexander made it the starting-point of his invasion of Inner Asia Minor. Long the metropolis of Pamphylia Secunda, it was superseded in Byzantine times by its port, Attalia, which became a metropolis in 1084. The extensive ruins all lie in the plain south of the Acropolis. The walls are well preserved, but of late Roman or Byzantine reconstruction. The lines of intersecting streets can easily be made out, and there are ruins of two sets of baths, two basilicas and a forum. But the most notable monument is the theatre, which lies outside the walls on the south-west, near the stadium. This is as perfect as those of Myra and Pataura, but larger than either, and yields the palm only to those of Aspendos and Side. Modern Murtana is a large village, long under the dominion of the Dere Beys of the Tekke Oglu family.

PERGAMENOUS (Lat. pergamentum, parchment), a technical term used of anything of the texture of parchment, as in zoology of the wing-covers of insects.}

PERGAMUM, or Pergamus (mod. Bergama), an ancient city of Teuthania, a district in Mysia. It is usually named Πέργαμον by Greek writers, but Ptolemy has the form Πέργαμος. The name, which is related to the German burg, is appropriate to the situation on a lofty isolated hill in a broad fertile valley, less than 15 m. from the mouth of the Cacus. According to the belief of its inhabitants, the town was founded by Arcadian colonists, led by Telephus, son of Heracles. Auge, mother of

Telephus, was priestess of Athena Alea at Tegea, and daughter of Acadis; fleeing from Tegea, she became the wife of Teuthras, the eponymous king of Teuthrania, and her son Telephus succeeded him. Athena Polias was the patron-goddess of Pergamum, and the legend combines the ethnological record of the connexion claimed between Arcadia and Pergamum with the usual belief that the hero of the city was son of its guardian deity, or at least of her priestess. Nothing more is recorded of the city till the time of Xenophon, when it was a small fortified town on the summit of the hill; but it had been striking coins since 420 B.C. at latest. Its importance began under Lysimachus, who deposited his treasures, 9000 talents, in this strong fortress under the charge of a eunuch, Philetaerus of Tium. In 283 B.C. Philetaerus rebelled, Lysimachus died without being able to put down the revolt, and Pergamum became the capital of a little principality. Partly by clever diplomacy, partly through the troubles caused by the Gaulish invasion and by the dissensions among the rival kings, Philetaerus contrived to keep on good terms with his neighbours on all sides (283-265 B.C.). His nephew Eumenes (263-241) succeeded him, increased his power, and even defeated Antiochus III of Syria in pitched battle near Sardis. His successor Attalus I. (241-197) won a great battle over the Gauls, and assumed the title of king. The other Greek kings who aimed at power in Asia Minor were his natural enemies, and about 222 reduced Pergamene power to a very low ebb. On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus prudently connected himself with them and shared in their continuous success. Pergamum thus became the capital of a considerable territory and a centre of art and regal magnificence. The wealth of the state and the king's desire to celebrate his victories by monuments of art led to the rise of the "Pergamene school" in sculpture. The splendour of Pergamum was at its height under Eumenes II. (197-150). He continued true to the Romans during their wars with Antiochus and Perseus, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, great part of Phrygia, Ionia and Caria. To celebrate the great achievement of his reign, the defeat of the barbarian Gauls, he built in the agora a vast altar to Zeus Soter (see below). He left an infant son, Attalus (III.), and a brother, Attalus II. (Philadephos), who ruled 159-138, and was succeeded by his nephew, Attalus III. (Philometer). The latter died in 133, and bequeathed his kingdom to the Romans, who erected part of it (excluding Great Phrygia, which they gave to Mithradates of Pontus) into a province under the name of Asia. Pergamum continued to rank for two centuries as the capital, and subsequently, with Ephesus and Smyrna, as one of the three great cities of the province; and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the Acropolis a magnificent temple to Augustus. It was the seat of a consentus, including the cities of the Cucus valley and some of those in the northern part of the Hermus valley. Under the Roman Empire Pergamum was one of the chief seats of the worship of Asclepius "the Saviour"; invalids came from distant parts of the country to ask advice of the god. The temple and the curative establishment of the god were situated outside the city. Pergamum was the chief centre of the imperial cult under the early empire, and, in W. M. Ramsay's opinion, was for that reason referred to in Rev. ii. 13 as the place of "Satan's throne." It was also an early seat of Christianity, and one of the Seven Churches. The place, re-fortified by the Byzantines, and still retaining its name as Bergama, passed into Moslem hands early in the 14th century. The lower town was rebuilt, and in the 17th and 18th centuries became a chief seat of the great Dey family of Kara Osman Oglu (see MANISA), which did not resign it to direct Ottoman control until about 1825. It is still an administrative and commercial centre of importance, having some 20,000 inhabitants.

Excavations.—The site of the ancient city has been the scene of extensive excavations promoted by the Berlin museum since 1878, and directed first by K. Humann and A. Conze, and afterwards by W. Dörpfeld. The first impulse to them was given in 1873 by the reception in Berlin of certain reliefs, extracted by Humann from the walls of Bergama. These were recognized as probably parts of the Great Altar of Zeus erected by Eumenes II. in 180 B.C. and decorated with a combat of gods and giants, symbolic of the struggle between the Pergamene Greeks and the Gaulish barbarians. Excavation at the south end of the Acropolis led to the discovery of the Altar itself and the rest of its surviving reliefs, which, now restored and mounted in Berlin, form one of the glories of that city. In very high relief and representing furious action, these sculptures are the finest which survive from the Pergamene school, which replaced the repose and breadth of earlier schools by excess of emphasis and detail. The summit of the Acropolis is crowded with public buildings, between the market place, which lies at the southern point, and the Royal Gardens on the north. In the interval are the Zeus altar; the great hexastyle Doric temple of Athena flanked by the palace on the east, by the theatre and its long terrace on the west, and by a library on the north; and a large Corinthian temple of Trajan. The residential part of the Greek, and practically all the Roman city lay between the palace and the theatre, now mostly occupied by modern Bergama; but west of the river Selinus, on rising ground facing the Acropolis, are to be seen notable remains of a Roman theatre, an amphitheatre and a circus.

PERGOLESI (Lat. pergula, a projecting roof, shed, from pergere, to reach forward, project), a term adopted from the Italian for an arbour, of trellis-work over which are trained creeping plants, vines, &c., and especially for a trellis-work covering a path, walk, or balcony in a garden.

PERGOLESE (or PERGOLESE), GIOVANNI BATTISTA (1710-1736), Italian musical composer, was born at Jesi near Ancona on the 3rd of January 1710, and after studying music under "local masters until he was sixteen was sent by a noble patron to complete his education at Naples, where he became a pupil of Greco, Durante and Feo for composition and of Domenico de Matteis for the violin. His earliest known composition was a sacred drama, La Conversione di S. Guglielmo d'Aquitania, between the acts of which was given the comic intermezzo Il Maestro di musica. These works were performed in 1731, probably by fellow pupils, at the monastery of St Agnello Maggiore. Through the influence of the prince of Stigliano and other patrons, including the duke of Maccilaci, Pergolesi was commissioned to write an opera for the court theatre, and in the winter of 1731 successfully produced La Sallustia, followed in 1732 by Rismero, which was a failure. Both operas had comic intermezzi, but in neither case were they successful. After this disappointment he abandoned the theatre for a time and wrote thirty sonatas for two violins and bass for the prince of Stigliano. Pergolesi then worked on the operas commissioned in 1733 for the theatre, La Finta Sposa and Acis and Galatea. La Finta Sposa was produced in the winter of 1733-1734, and a second mass, also for two choirs and orchestra, is said to have been praised by Leo. In September 1733 he returned to the stage with a comic opera in Neapolitan dialect, Lo Frate inamorato, which was well received; and in 1733 he produced a serious opera, Il Prigionier, to which he performed Serva padrona furnished the intermezzi. There seems, however, no ground for supposing that this work made any noticeable difference to the composer's already established reputation as a writer of comic opera. About this time (1733-1734) Pergolesi entered the service of the duke of Maccilaci, and accompanied him to Rome, where he conducted a mass for five voices and orchestra in the church of St Lorenzo in Lucina (May 1734). There is no foundation for the statement that he was appointed maestro di cappella at the Holy House of Loreto; he was, in fact, organist of the royal chapel at Naples in 1735. The complete failure of L'Olimpiade at Rome in January 1735
PERGOLESI, M. A.—PERIANDER

is said to have broken his health, and determined him to abandon the theatre for the Church; this statement is, however, incompatible with the fact that his comic opera *Il Flaminio* was produced in Naples in September of the same year with undoubted success. His ill health was more probably due to his notorious profligacy. In 1736 he was sent by the duke of Maddaloni to the Capuchin monastery at Pozzuoli, the air of the place being considered beneficial to cases of consumption. Here he is commonly supposed to have written the celebrated *Stabat Mater*: Paisiello, however, stated that this work was written soon after he left the Conservatorio dei poveri di Gesù Cristo in 1729. We may at any rate safely attribute to this period the Scherzo fatto ai Cappuccini di Pozzuoli, a musical jest of a somewhat indecent nature. He died on the 17th of March 1736, and was buried in the cathedral of Pozzuoli.

Pergolesi's posthumous reputation has been exaggerated beyond all reason. This was due partly to his early death, and largely to the success of *La Serva padrona* when performed by the Bouffons Italiens at Paris in 1752. Charming as this little piece undoubtedly is, it is inferior both for music and for humour to Pergolesi's three-act comic operas in dialect, which are remembered now only by the air "Ogni pena più spietata" from *Lo Fratì inamorato*. As a composer of sacred music Pergolesi is effective, but essentially commonplace and superficial, and the irivulous style of the *Stabat Mater* was rightly censured by Paisiello and Padre Martini. His best quality is a certain sentimental charm, which is very conspicuous in the cantata L'Orfeo and in the genuinely beautiful duets "Se cerca, se dice" and "Né' giorni tuoi feli" of the serious opera L'Olimpia; the latter number was transferred unaltered from his early sacred drama S. Guglielma, and we can thus see that his natural talent underwent hardly any development during the five years of his musical activity. On the whole, however, Pergolesi may be regarded as one of the originators of the same school, and it is purely accidental that a later age should have regarded him as its greatest representative.

BIBLIOGRAPHY.—The most complete life of Pergolesi is that by E. Faustini Faasi (Gazetta musicale di Milano, 31st of August 1892, &c., published by Ricordi in book form, 1900); G. Annibaldi's *II Pergolesi in Pozzuoli, vita intima* (Jesi, 1898) gives some interesting additional details derived from documents at Jesi, but is cast in the form of a romantic novel. H. M. Schletterer's letter in the Sammlung musikalischer Vorträge, edited by Count P. von Waldersee, is generally inaccurate and uncritical, but gives a good account of Pergolesi's *Il Flaminio* and *Orfeo*. His life is also treated of in Dansat's *Dictionnaire des Compositeurs* (Paris, 1899), with various portraits are reproduced in the Gaz. mus. di Milano for the 14th of December 1899, and in Musica e musicisti, December 1905. Complete lists of his compositions are given in Eitner's *Disertazioni* and in Grove's Dictionary (new ed.). (E. J. D.)

PERGOLESI, MICHAEL ANGELO, an 18th-century Italian decorative artist, who worked chiefly in England. Biographical details are almost entirely lacking, but like Cipriani he was brought, or attracted, to England by Robert Adam after his famous continental tour. He worked so extensively for the Adams, and his designs are so closely typical of much upon which their reputation rests, that it is impossible to doubts his influence upon their style. His range, like theirs, was catholic. He designed furniture, mantelpieces, ceilings, chandeliers, doors and mural ornament with equal felicity, and as an artist in plaster work in low relief he was unapproached in his day. He delighted in urns and sphinxes and interlaced griffons, in amorini with bows and torches, in trophies of musical instruments and martial weapons, and in flowering arabesques which were always graceful if sometimes rather thin. The centre panels of his walls and ceilings were often occupied by classical and pastoral subjects painted by Cipriani, Angelica Kaufmann, Antonio Zucchi, her husband, and sometimes by himself. These nymphs and amorini, with their disengaged and *ant* air and classic grace, were not infrequently used as a background for largescale decoration and to gladden the walls of the satinwood furniture of the last quarter of the 18th century which has never been surpassed for dainty elegance, and for the popularity of which Pergolesi was in large measure responsible; they were even reproduced in marquetry. Some of this painted work was, apparently, executed by his own hand; most of the pieces attributed to him are remarkable examples of artistic taste and technical skill. His satin-wood table-tops, china cabinets and side-tables are the last word in a daintiness which here and there perhaps is mere prettiness. Pergolesi likewise designed silver plate, and many of his patterns are almost instinctively attributed to the brothers Adam by the makers and purchasers of modern reproductions. There is, moreover, reason to believe that he aided the Adam firm in purely architectural work. In later life Pergolesi appears, like Angelica Kaufmann, to have returned to Italy.

Our chief source of information upon his works is his own publication, *Designs for Various Ornaments on Seventy Plates*, a series of folio sheets, without text, published between 1777 and 1801.

PERI, JACOPO (1561-1623), Italian musical composer, was born at Florence on the 29th of August 1561, of a noble family. After studying under Cristoforo Malvezzi of Lucca, he became maestro di cappella, first to Ferdinando, duke of Tuscany, and later to Cosimo II. He was an important member of the literary and artistic circle which frequented the house of Giovanni Bardi, conte de Vernio, where the revival of Greek tragedy with its appropriate musical declamation was a favourite subject of discussion. With this end in view the poet Ottavio Rinuccini supplied a drama with the title of Dafne, to which Peri composed music, and this first attempt at opera was performed privately in 1597 in the Palazzo Corsi at Florence. This work was so much admired that in 1600 Rinuccini and Peri were commissioned to produce an opera on the occasion of the marriage of Henry IV. of France with Maria di' Medici. This work (L'Euridice) attracted a great deal of attention, and the type once publicly established, the musical drama was set on the road to success by the efforts of other composers and the patronage of other courts. Peri himself seems never to have followed up his success with other operas; he became maestro di cappella to the court of Pantelleria in 1601, but after the publication of his *Varie musiche a una* in the same year 1609, nothing more is known of him.

Peri's Dafne (which has entirely disappeared) and Euridice (printed at Florence 1600; reprinted Venice 1608 and Florence 1683) are of the greatest importance not only as being the earliest attempts at opera, but as representing the new monodic and declamatory style which is the basis of modern music as opposed to the contrapuntal methods of Palestrina and his contemporaries. Peri's work is of course primitive in the extreme, but it is by no means without beauty, and there are many scenes in Euridice which show a considerable dramatic power.

PERIANDER (Gr. Περιάνδρος), the second tyrant of Corinth (615-585 B.C.). In contrast with his father Cypselus, the founder of the dynasty, he is generally represented as a cruel despot, or at any rate as having used all possible devices for keeping his city in subjection. Among numerous anecdotes the following is characteristic. Periander, on being consulted by the tyrant Thrasybulus of Miletus as to the best device for maintaining himself in power, by way of reply led the messenger through a cornfield, and as he walked struck off the tallest and best-grown ears (a legend applied to Roman circumstances in Livy i. 54). It seems, however, that the prevalent Greek tradition concerning him was derived from the versions of the Corinthian aristocracy, who had good reasons for giving a prejudiced account, and the conflicting character of the various legends further shows that their historical value is slight. A careful sitting of the available evidence would rather tend to represent Periander as a ruler of unusual probity and insight, and the exceptional firmness and activity of his government is beyond dispute. His home administration was so successful that he was able to dispense with direct taxation. He fostered wealth by the steady encouragement of industry and by drastic legislation against idleness, luxury and vice; and the highest prosperity of the Corinthian handicrafts may be assigned to the period of his rule (see CORINTH). At the same time he sought to check excessive accumulation of wealth in individual hands and restricted the influx of population into the town. Employment was found
PERICLES

The beginning of his ascendency is marked by an unprecedented outward expansion of Athenian power. In continuance of Cimon's policy, 20 ships were sent to support the Egyptian insurrection against Persia (459), while detachment operated, against Cyprus and Phoenicia. At the same time Athens embarked on several wars in Greece Proper. An alliance with the Megarians, who were being hard pressed by their neighbours of Corinth, led to enmity with this latter power, and before long Epirus and Aegina were drawn into the struggle. On sea the Athenians, after two minor engagements, gained a decisive victory which enabled them to blockade Aegina. On land their general Myronides beat off two Corinthian attacks on Megara, which had been further secured by long walls drawn between the capital and its port, Nisiae, nearly a mile distant. In 457 the Athenians and their allies ventured to intercept a Spartan force which was returning home from central Greece. At Tanagra in Boeotia a pitched battle was fought, in which both Pericles and the partisans of Cimon distinguished themselves. The Spartans were successful but did not pursue their advantage, and soon afterwards the Athenians, seizing their opportunity, sallied forth again, and, after a victory under Myronides at Oenophyta, obtained the submission of all Boeotia, save Thebes, and of Phocis and Locris. In 455 Tolmides ravaged Laconia and secured Naupactus on the Corinthian gulf; in 454 Pericles himself defeated the Sicyonians, and made a descent upon Oeniadae at the mouth of the Gulf, and in 453 conducted a cleroeid to the Thracian Chersonese. These marks made the growth of Athenian greatness. Yet the drain on the country's strength was severe, and when news arrived in 453 that the whole of the Egyptian armament, together with a reserve fleet, had been destroyed by the Persians, a reaction set in, and Cimon, who was recalled on Pericles' motion (but see Cimon), was empowered to make peace with Sparta on the basis of the status quo. For a while the old anti-Persian policy again found favour in Athens, and Cimon led a great expedition against Cyprus; but on Cimon's death hostilities were suspended, and a lasting arrangement with Persia was brought about. It was probably in order to mark the definite conclusion of the Persian War and to obtain recognition for Athens' work in punishing the Mede that Pericles now proposed a pan-Hellenic congress at Athens to consult about the rebuilding of the ruined temples and the policing of the seas; but owing to the refusal of Sparta the project fell through.

Pericles may now have hoped to resume his aggressive policy in Greece Proper, but the events of the following years completely disillusioned him. In 447 an Athenian army, which had marched into Boeotia to quell an insurrection, had to surrender in a body at Coronea, and the price of their ransom was the evacuation of Coronea in a position to sustain such a congress, and would not have sent 10 envoy out of 20 to northern and central Greece, where she had just lost all her influence; nor is it likely that the building of the Parthenon (begun not later than 447) was entered on before the congress.

1 The chronology of these years down to 440 is not quite certain.
2 An abortive expedition to reinstate a Thessalian prince probably also belongs to this year; there is also evidence that Athens interfered in a war between Selinus and Segesta in Sicily about this time.
3 The "peace of Callias" is perhaps a fiction of the 4th century orators. All earlier evidence goes to show that only an informal understanding was arrived at, based on the de facto inability of either power to cripple the other (see Cimon).
4 448 seems the most likely date. Before 460 Pericles' influence was as yet too small; 460-451 were years of war. After 445 Athens was hardly in a position to summon such a congress, and would not have sent 10 envoy out of 20 to northern and central Greece, where she had just lost all her influence; nor is it likely that the building of the Parthenon (begun not later than 447) was entered on before the congress.
While scouting the projects of the extreme Radicals for interfering in distant countries, he occasionally made a display of Athens' power abroad, as in his expedition to the Black Sea, and in the colonization of Thurii, which marks the resumption of a Western policy.

The peaceful development of Athenian power was interrupted by the revolt of Samos in 440. Pericles himself led out a fleet against the seceders and, after winning a first engagement, unwisely divided his armament and allowed one squadron to be routed. In a subsequent battle he retrieved this disaster, and after a long blockade reduced the town itself. A demand for help which the Samians sent to Sparta was rejected at the instance of the Corinthians.

Turning to Pericles' policy towards the members of the Delian League, we find that he frankly endeavoured to turn the allies into subjects (see Delian League). A special feature of his rule was the sending out of numerous cleruchies (q.v.), which served the double purpose of securing strategic points to Athens and of converting the needy proletariate of the capital into owners of real property. The land was acquired either by confiscation from disaffected states or in exchange for property lost by the chief cleruchies of Pericles are: Thracian Chersonese (433-432), Lemnos and Imbros, Andros, Naxos and Eretria (before 447); Brea in Thrace (446); Oreus (445); Amisos and Astacus in the Black Sea (after 440); Aegina (431).

In his home policy Pericles carried out more fully Ephialtes' project of making the Athenian people truly self-governing. His chief innovation was the introduction of payment from the public treasury for state service. Chief of all, he provided a remuneration of 1 to 2 obols a day for the jurors, probably in 451. Similarly he created a "theoricon" fund which enabled poor citizens to attend the dramatic representations of the Dionysia. To him we may also attribute the 3 obols pay which the soldiers received during the Peloponnesian War in addition to the old-established provision-money. The archons and members of the boulé, who certainly received remuneration in 411, and also some minor magistrates, were perhaps paid for the first time by Pericles. In connexion with this system of salaries should be mentioned a somewhat reactionary law carried by Pericles in 451, by which an Athenian parentage on both sides was made an express condition of retaining the franchise and with it the right of sitting on paid juries. The measure by which the archonship was opened to the third and (practically) to the fourth class of citizens (the Zeugitae and Thetes) may also be due to Pericles; the date is now known to be 457 (Const. Ath. 26; and see Archon).

The last years of his life were troubled by a new period of storm and stress which called for his highest powers of calculation and self-control. A conflict between Corcyra and Corinth, the second and third naval powers of Greece, led to the simultaneous appearance in Athens of an embassy from either combatant (433). Pericles had, as it seems, resumed of late a plan of Western expansion by forming alliances with Rheimium and Leontini, and the favourable position of Corcyra on the trade-route to Sicily and Italy, as well as its powerful fleet, no doubt helped to induce him to secure an alliance with that island, and so to commit an unfriendly act towards a leading representative of the Peloponnesian League. Pericles now seemed to have made up his mind that war with Sparta, the head of that

1 The date can hardly be fixed; probably it was after 440.
2 It has been doubted whether Pericles favoured this enterprise, but among its chief promoters were two of his friends, Lampon the jeweller and Hippodamus the architect. The oligarch Cratinus (in a frag. of the Phrynikes) violently attacks the whole project.
3 These dates are suggested by the decrease of tribute which the inscription represents.
4 This is the date given by the Const. Ath., which also mentions a διατηρημένοι τῶν διάστησις (Blass' restoration) in frag. c. 18. The confused story of Philochorus and P/allatarch, by which 4700 citizens were disfranchised or even sold into slavery in 445, when an Egyptian prince sent a largess of corn, may refer to a subsequent application of Pericles' law, though probably on a much milder scale than is here represented.
5 The general impression in Greece was that this decree was the proximate cause of the war. The sordid motives which Aristotle suggests for this measure can be entirely disregarded.
6 His dying boast, that "no Athenian had put on mourning through his doing," perhaps refers to his forbearance towards his political rivals, whom he refused to ruin by prosecution.
of attitude. Henceforward he repressed all projects of reckless enterprise, and confined himself to the gradual expansion and consolidation of the empire. It is not quite easy to see why he abandoned this successful policy in order to hasten on a war with Sparta, and neither the Corcyrean alliance nor the Megarian decree seems justified by the facts as known to us, though commercial motives may have played a part which we cannot now gauge. In his adoption of a purely defensive policy at the beginning of the Peloponnesian War, he miscalculated the temper of the Athenians, whose morale would have been better sustained by a greater show of activity. But in the main his policy in 431-420 was sound, and the disasters of the war cannot fairly be laid to his charge. The foundation of cleruchies was an admirable device, which in many ways anticipated the colonial system of the Romans.

In his attitude towards the members of the Delian League Pericles likewise maintained a purely Athenian point of view. But he could hardly be said seriously to have oppressed the subject cities, and technically all the League money was spent on League business, for Athens, to whom the chief monuments in Athens were reared, was the patron goddess of the League. Under Pericles Athens also attained her greatest measure of commercial prosperity, and the activity of her traders all over the Levant, the Black Sea and the West, is attested not only by literary authority, but also by numerous Attic coins, vases, &c.

Pericles' home policy has been much debated since ancient times. His chief enactments relate to the payment of citizens for State service. These measures have been interpreted as an appeal to the baser instincts of the mob, but this assumption is entirely out of keeping with all we know of Pericles' general attitude towards the people, over whom Thucydides says he practically ruled as a king. We must, then, admit that Pericles sincerely contemplated the good of his fellow-countrymen, and we may believe that he endeavoured to realize that ideal Athens which Thucydides sketches in the Funeral Speech—An Athens where free and intelligent obedience is rendered to an equitable code of laws, where merit finds its way to the front, where military efficiency is found along with a free development in other directions and strange neither commerce nor art. In accordance with this scheme Pericles sought to educate the whole community to political wisdom by giving to all an active share in the government, and to train their aesthetic tastes by making accessible the best drama and music. It was most unfortunate that the Peloponnesian War ruined this great project by diverting the large supplies of money which were essential to it, and confronting the remodelled Athenian democracy, before it could dispense with its tutelage, with a series of intricate questions of foreign policy which, in view of its inexperience, it could hardly have been expected to grapple with successfully.

Pericles also incurred unpopularity because of his rationalism in religious matters; yet Athens in his time was becoming ripe for the new culture, and would have done better to receive it from men of his circle—Anaxagoras, Zeno, Protagoras and Meton—than from the more irresponsible sophists. The influence of Aspasia on Athenian thought, though denounced un sparingly by most critics, may indeed have been beneficial, insomuch as it tended towards the emancipation of the Attic woman from the outer-strict tutelage in which she was kept. As a patron of art Pericles was a still greater force. His policy in encouraging the drama has already been mentioned: among his friends he could count three of the greatest Greek writers—the poet Sophocles and the historians Herodotus and Thucydides. Pericles likewise is responsible for the epoch-making splendour of Attic art in his time, for he not only so far appreciated and glorified in bicpe to the genius of Phidias, Athens would hardly have witnessed the raising of the Parthenon and other glorious structures, and Attic art could not have boasted a legion of first-rate sculptors of whom Alcamenes, Agoracritus and Paconius are only the chief names. (See also GREEK ART.) Of Pericles' personal characteristics we have a peculiarly full and interesting record. He was commonly compared to Olympian Zeus, partly because of his serene and dignified bearing, partly by reason of the majestic roll of the thundering eloquence, with its bold poetical imagery, with which he held friend and foe spellbound. The same dignity appeared in the grave beauty of his features, though the abnormal height of his cranium afforded an opportunity for ridicule of which the comedians made full use. In spite of an unusually large crop of scandals about him we cannot but believe that he bore an honourable character, and his integrity is vouched for by Thucydides in such strong terms as to exclude all further doubt on the question.
yields most of the peridot of commerce but it is now identified with the island of St John, or Isle Zeboïget, in the Red Sea, where it occurs, as shown by M. J. Couy, in an altered dunite or olivine rock (Bull. soc. franç. min., 1908). This is probably the Topaz Isle, toראדואס, of the ancients. It is generally held that the mineral now called topaz was unknown to ancient and mediaeval writers, and that their toראדואס was our peridot. Such was probably the Hebrew pidadh, translated "topaz" in the Old Testament. Dr G. F. Kunz has suggested that the peridots of modern trade are largely derived from old jewelry. The famous shrine of the Three Kings in Cologne Cathedral contains a large peridot, which has commonly been regarded as an emerald.

It is notable that pebbles of transparent olivine, fit for cutting, are found in the United States in Montana, Arizona and New Mexico; in consequence of their shape and curiously pitted surface they are known as "Job's tears." (F. W. R.)*

PERIDOTITE, a plutonic holocrystalline rock composed in large part of olivine, and almost or entirely free from feldspar. The rocks are the most basic, or least siliceous plutonic rocks, and contain much iron oxide and magnesia. Hence they have dark colours and a high specific gravity (3.0 and over). They weather readily and are changed to serpentine, in which process water is absorbed and enters into chemical combination with the silicates of magnesia and iron. In some peridotites, such as the dunites, olivine greatly preponderates over all other minerals. It is always in small, rather rounded crystals without good crystalline form, and pale green in colour. Most of the rocks of this group, however, contain other silicates such as augite, hornblende, biotite or rhombic pyroxene, and often two or three of these are present. By the various mineral combinations different species are produced, e.g. mica-peridotite, hornblende-peridotite, enstatite-peridotite. Of the accessory minerals the commonest are iron oxides and chromium or picotite. In some peridotites these form segregations or irregular masses which are of importance as sources of the ores of chromium. Corundum occurs in small crystals in many North American peridotites and platinum and the nickel-iron compound wauarite are found in rocks of this class in New Zealand. Plagioclase or pyroxene (pyroxenite) characterizes the peridotites of Bohemia. The diamond mines of South Africa are situated in pipes or volcanic necks occupied by a peridotite breccia which has been called kimberlite. In this rock in addition to diamond the following minerals are found, hypersthene, garnet, biotite, pyroxene (chromo-diopside), ilmenite, zircon, &c.

Some peridotites have a granular structure, e.g. the dunites, all the crystal grains being of rounded shape and nearly equal size; a few are porphyritic with large individuals of diabase, augite or hypersthene. Some are banded with parallel bands of dissimilar composition, the result probably of fluid in a magma which was not quite homogeneous. The great majority of the rocks of this group are poikilitic, that is to say, they contain olivine in small rounded crystals embedded in large irregular masses of pyroxene or hornblende. The structure is not unlike that known as ophitic in the dolerites, and arises from the olivine having first separated out of the liquid magma which solidified to pyroxene or hornblende; these have been called scapolites. In hand specimens of the rocks the smooth and shining cleavage surfaces of hornblende and augite are dotted over with dull blackish green spots of olivine; to this appearance the name "lustre-mottling" has been given.

Mica-peridotites are not of frequent occurrence. A well-known rock from Kaltes Thal, Harzburg, contains much biotite, deep brown in this section. Other examples are found in India and in Arkansas. Poikilitic structure is rarely well developed in this group of rocks, but those of Kimberley which contains the diamonds is a brecciaform biotite-hypersthene-peridotite with augite. In the north of Scotland, in several places in Sutherland and Ross, there are peridotites with silvery green biotite and large plagioclase; the hornblende dull green. In the hornblende-peridotites lustre-mottling is often very striking. The amphibole may be colourless tremolite in small prisms, as in some varieties of serpentine from the Lizard (Cornwall); or pale green hornblende as in scapolite. In both these cases there is some probability that the hornblende has developed partly at least, from olivine or augite. In sheared peridotites tremolite and actinolite are very frequent. Other rocks contain dark brown hornblende, with much olivine; there may also be augite which is often intergrown peripherally with the hornblende. Examples of this type occur in North Wales, Anglesey, Cornwall, Cordova, New Mexico, and other localities. A well-known peridotite from Schriesheimer Tal in the Odenwald has pale brownish green amphibole in large crystals filled with small grains of olivine which are mostly serpentinized. Very often primary brown hornblende in rocks of this type is surrounded by fragments or loose particles of hornblende which has formed as a secondary mineral after olivine. Complete pseudomorphs after olivine composed of a matrix of scaly talc and chlorite crossed by a network of tremolite needles, are also very common in some peridotites, especially those which have been subjected to strong pressure or shearing; these aggregates are known as talcite.

The peridotites which contain monoclinic pyroxene may be divided into two classes, those rich in diabase and those with much augite. The augite-peridotites have been called "saxitiles" or "saxitile rocks"; they often show excellent lustre-mottling. Brown or green hornblende may surround the diabase, and hypersthene may occur also in lamellar intergrowth with it. Some of these rocks, rich while a little feldspar (often saussurite) may often be seen in the sections. Rocks of this kind are known in Hungary, in the Odenwald and in Silesia. In Skye the pyroxene-bearing peridotites usually contain green chrome-diopside (a variety of augite distinguished by its pale colour and the presence of a small amount of chromium). The augite-peridotites are grouped by German petrographers under the picrites, but this term has a slightly different significance in the English nomenclature (see Fig. 8).

The enstatite-peridotites are an important group represented in many parts of the world. Their rhombic pyroxene is often very pale coloured but may then be filled with platy enclosures which give it a metallic or bronze lustre. These rocks have been called enstatite-augites or hornblendes; they show here the enstatite into platy masses of bastite. Picotite and chrome are common accessory minerals and diabase or hornblende may also be present. Many of the serpentine rocks of the Lizard (Cornwall) Ayrshire and others in Scotland are known from Baste near Harzburg, New York and Maryland, Norway, Finland, New Zealand, &c. Often the enstatite crystals are of large size and are very conspicuous in the hand specimens. They may be brown in matrix or form a cortex enclosing innumerable olivine grains, and then lustre-mottling is as a rule very well shown. The herzolites are rocks, first described from Lherz in the Pyrenees, consisting of olivine and chromite and carbonatic and iron oxides. Picotite or chrome. They are fine-grained, bright green in colour, often very fresh, and may be somewhat granulatic. The dunites are peridotites, similar to the rock of Dun Mountain, New Zealand, composed of olivine with small areas of chromite. Many examples of this type are known in different parts of the world, usually as local facies of other kinds of peridotite. In olivine-basalts of Tertiary age in the Rhine district small nodules of green olivine occur frequently. These may be olivine alone, or in addition to olivine they may contain chrome, spinel and magnetite, enstatite and chrome-diopside. Some geologists believe these to be fragments of dunite detached from large rocks not exposed at the surface; others consider that they are aggregations of the early minerals of the basal magma, which were already crystallized before the liquid rock was emitted. The great majority of stony or lithoidal meteorites (aerolites) are rich in olivine and present many analogues to the terrestrial peridotites. Among their minerals are hypersthene (enstatite) augite and chrome-diopside, chromite, pyrite and troilite, nickeliferous iron and basic plagioclase feldspar. The structure of these meteorites is described in full in the preceding section. They occur as small or large rounded grains arranged in radiate clusters; this has very rarely been observed in ordinary peridotites. Although many peridotites are known in which the constituent minerals exceed 90% of the aggregate, their rarity show more or less advanced decomposition. The olivine is especially unstable and is altered to serpentine, while augite, hornblende and biotite are in large measure fresh. In other cases the whole rock is changed to an aggregate of secondary products. Most serpentine (p.) is changed in this way.

PÉRIER, CASIMIR PIERRE (1777-1832), French statesman, was born at Grenoble on the 11th of October 1777, the fourth son of a rich banker and manufacturer, Claude Périer (1742-1801), in whose house the estates of Dauphiny met in 1788. Claude Périer was one of the first directors of the Bank of France; of his eight sons, Augustin (1787-1833), Antoine Scipion (1776-1821), Casimir Pierre and Camille (1781-1844), all distinguished themselves in industry and in politics. The family removed to Paris after the revolution of Thermidor, and Casimir joined the army of Italy in 1798. On his father's death he left the
arms and with his brother Scipion founded a bank in Paris, the speculations of which he directed while Scipion occupied himself with its administration. He opposed the ruinous methods by which the duc de Richelieu sought to raise the war indemnity demanded by the Allies, in a pamphlet Réflexions sur le projet d'emprunt (1817), followed in the same year by Dernières réflexions... in answer to an inspired article in the Moniteur. In the same year he entered the chamber of deputies for Paris, taking his seat in the Left Centre with the moderate opposition, and making his first speech in defence of the freedom of the press. Re-elected for Paris in 1822 and 1824, and in 1827 for Paris and for Troyes, he elected to represent Troyes, and sat for that constituency until his death. Périer's violence in debate was not associated with any disloyalty to the monarchy, and he held resolutely aloof from the republican conspiracies and intrigues which prepared the way for the revolution of 1830. Under the Martignac ministry there was some prospect of a reconciliation with the court, and in January 1829 he was nominated a candidate for the presidency of the chamber; but in August with the elevation to power of Polignac the truce ceased, and on the 15th of March 1830 he was one of the 221 deputies who repudiated the pretensions put forward by Charles X. Averse by instinct and by interest to popular revolution he nevertheless sat on the provisory commission of five at the hôtel-de-ville during the days of July, but he refused to sign the declaration of Charles X.'s dethronement. Périer reluctantly recognized in the government of Louis Philippe the only alternative to the continuance of the Revolution; but he was no favourite with the new king, whom he scourged for his truckling to the mob. He became president of the chamber of deputies, and sat for a few months in the cabinet, though without a portfolio. On the fall of the weak and discredited ministry of Laffitte, Casimir Périer, who had drifted more and more to the Right, was summoned to power (March 13, 1831), and in the short space of a year he restored civic order in France and re-established her credit in Europe. Paris was in a constant state of disturbance from March to September, and was only held in check by the premier's determination; the workmen's revolt at Lyons was suppressed after hard fighting; and at Grenoble, in face of the quarrels between the military and the inhabitants, Périer declined to make any concession to the townsfolk. The minister refused to be dragged into armed intervention in favour of the revolutionary government of Warsaw, but his policy of peace did not exclude energetic demonstrations in support of French interests. He constituted France the protector of Belgium by the prompt expedition of the army of the north against the Dutch in August 1831; French influence in Italy was asserted by the audacious occupation of Ancona (Feb. 23, 1832), and the protection of the indemnity for compensations for injuries to French residents by the Portuguese government was followed by a naval demonstration at Lisbon. Périer had undertaken the premiership with many forebodings, and overwork and anxiety prepared the way for disease. In the spring of 1832 during the cholera outbreak in Paris, he visited the hospitals in company with the duke of Orleans. He fell ill the next day of a violent fever, and died six weeks later, on the 16th of May 1832.

His Opinions et discours were edited by A. Lesieur (2 vols., 1838); C. Nicoulaud published in 1894 the first part (Casimir-Périer, défaut de l'opposition, 1817-1830) of a study of his life and policy; and his ministry is exhaustively treated by Thureau-Dangin in vols. i. and ii. (1884) of his Histoire de la monarchie de juillet. His elder son, Auguste Victor Laurent Casimir Périer (1811-1876), the father of President Casimir-Périer (see Casimir-Périer), entered the diplomatic service, being attached successively to the London, Brussels and St. Petersburgh embassies, and in 1843 became minister plenipotentiary at Hanover. In 1846 he resigned from the service to enter the legislature as deputy for the department of Seine, a constituency which he exchanged for Aube after the Revolution of 1848. On the establishment of the Second Empire he retired temporarily from public life, and devoted himself to economic questions on which he published a series of works, notably Les Finances et la politique (1863), dealing with the interaction of political institutions and finance. He contested Grenoble unsuccessfully in 1863 against the imperial candidate, Casimir Royer; and failed again for Aube in 1869. In 1871 he was returned by three departments to the National Assembly, and elected to sit for Aube. He was minister of the interior for a few months in 1871-1872, and his retirement deprived Thiers of one of the strongest elements in his cabinet. He also joined the short-lived ministry of May 1873. He consistently opposed all efforts in the direction of a monarchical restoration, but on the definite constitution of the republic became a life senator, declining MacMahon's invitation to form the first cabinet under the new constitution. He died in Paris on the 6th of June 1876.

For the family in general see E. Choulet, La Famille Casimir-Périer (Grenoble, 1894).

PERIGEE (Gr. περιγες, near, γη, the earth), in astronomy that point of the moon's orbit or of the sun's apparent orbit at which the moon or sun approach nearest to the earth. The sun's perigee and the earth's perihelion are so related that they differ 180° in longitude, the first being on the line from the earth toward the sun, and the second from the sun toward the earth. The longitude of the solar perigee is now 101°, that of the earth's perihelion 281°.

PERIGORD, one of the old provinces of France, formed part of the military government of Guienne and Gascony, and was bounded on the N. by Angoumois, on the E. by Limousin and Quercy, on the S. by Agenais and Bazadaz, and on the W. by Bordelais and Saintonge. It is now represented by the departments of Dordogne and part of Lot-et-Garonne. Périgord was in two divisions: Périgord blanc (cap. Périgueux) and Périgord noir (cap. Sarlat). In the time of Caesar it formed the civitas Pectoriorum, with Vesunna (Périgueux) as its capital. It became later part of Aquitania secunda and formed on the right bank of the Dordogne. Since the 8th century it had its own counts (see the Histoire généalogique de P. Anselme, tome iii.), who were feudatories of the dukes of Aquitaine and in the 13th century were the vassals of the king of England. In the 15th century the county passed into the hands of the dukes of Orleans, and in the 16th came to the family of d'Albret, becoming Crown land again on the accession of Henry IV.

See Dessalles, Histoire du Périgord (1888), the Bulletin of the Société historique et archéologique du Périgord (1874 seq.), the Inventaire sommaire de la Collection de Périgord " in the Bibliothèque nationale (1874); the Dictionnaire toponymique du département de la Dordogne by the Vicomte de Gourgues (1875).

PÉRIGUEUX, a town of south-western France, formerly capital of the old province of Périgord, now chief town of the department of Dordogne, 70 m. E.N.E. of Bordeaux, on the railway between that city and Limoges. Pop. (1906), 28,190. The town, situated on an eminence on the right bank of the Isle, is divided into three parts. On the slope of the hill is the medieval town, bordered south-east by the river and on the other three sides by esplanades and promenades; to the west is the modern town, which stretches to the station; to the south of the modern town is the old Roman town or cité, now traversed by the railway.

Three bridges connect Périgueux with the left bank of the Isle, where stood Vesunna, the capital of the Petrocorii. Hardly a trace of this old Gallic town remains, but not far off, on the Plateau de la Boissière, the rampart of the old Roman camp can still be traced. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the 1st or 2nd century, supplied by an aqueduct four miles long, which spanned the Isle. A circular building, called the "Tower of Vesunna," 68 ft. in diameter and 89 ft. in height, stands at what was formerly the centre of the city, where all the chief streets met. It is believed to have been originally the cella or main part of a temple, probably dedicated to the tutelary deities of Vesunna. Of the amphitheatre there still remain huge fragments of wall and vaulting. The building had a diameter of 1312 ft., that of the arena being 870 ft.; and, judging from its construction,
must be as old as the 3rd or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitations, and the sisters took it from the stones required for the construction of their nunnery. The most remarkable, however, of the ruins of the château is the Château Barrière, an example of the fortified houses formerly common there. Two of its towers date from the 3rd or 4th century, and formed part of the fortified enceinte; the highest tower is of the 10th century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief medieval building in the château is the church of St Étienne, once the cathedral. It dates from the 11th and 12th centuries, but suffered much injury at the hands of the Protestants in the religious wars when the tower and two of the three cupolas were destroyed. The choir and its cupola were skillfully restored in the 17th century. A fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century are to be seen in the interior. In the medieval town, known as Le Puy-St-Front, the most remarkable building is the cathedral of St Front, which, till its restoration, or rather rebuilding, in the latter half of the 19th century when the old structures were to a great extent lost, was of unique architectural value. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and according to one theory it was built from 984 to 1047, contemporaneously with the latter (977–1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 69 ft. in width, and the whole is 184 ft. long. These cupolas, 89 ft. high from the keystone to the ground, are supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. Adjoining St Front on the west are the remains of an old basilica of the 6th century, above which rises the belfry, the only one in the Byzantine style now extant. It dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surrounded by a dome. To the south-west of St Front, the buildings of an old abbey (11th to 16th century) surround a cloister dating chiefly from the 13th century. Of the fortifications of Puy St Front, the chief relic is the Tour Mataguerre (14th century).

Périgueux is seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a branch of the Bank of France. Its educational establishments include a lycée for boys, training colleges for both sexes and a school of drawing. The trade of the town is in pigs, truffles, flour, branded water and pâtés known as pâtés de Périgord.

Veszima was the capital of the Petrocorii, allies of Vercingetorix whom Caesar called Gaul. The country was afterwards occupied by the Romans, who built a second city of Veszima on the right bank of the Isle opposite the site of the Gallic town. The barbarian invasion brought this prosperity to a close. St Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St Front. The château was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. The new town soon began to rival the old city in importance, and it was not until 1240 that the attempts of the counts of Périgueux and the bishops to infringe on their municipal privileges brought about a treaty of union. During the Hundred Years' War, Périgueux was twice attacked by the English, who took the château in 1356; and the whole town was ceded to them by the Treaty of Brétigny, but returned to the French Crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV., and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a stronghold of the Calvinists, who in 1575 did great destruction there, and it also suffered during the troubles of the Fronde.

PERIHELION (Gr. ἡλιος, near, φως, sun), in astronomy, the point of nearest approach of a body to the sun. (See Orbit.)

PERIM, a British island in the strait of Bab-el-Mandeb, at the entrance to the Red Sea, and 96 m. W. by S. of Aden. Perim is 2 m. from the Arabian shore, is about 3½ m. long with an average breadth of over a mile and covers some 7 sq. m. There is a good harbour with easy entrance on the south side with a depth of water from 25 to 30 ft. It is largely used by mercantile vessels as a coaling-station and for taking in stores, including fresh water and ice. Perim, the Diádoros island of the Periplus, was, in consequence of the French occupation of Egypt, garrisoned from 1799 to 1801 by a British force. In view of the construction of the Suez Canal and the increasing importance of the Red Sea route to India, the island was annexed to Great Britain in 1857, fortified and placed under the charge of the Aden residency. In 1861 a lighthouse was built at its eastern end. Submarine cables connect the island with Aden, Egypt and Zanzibar. Population, including a garrison of 50 sepoys, about 200.

PERINO DEL VAGA (1500–1547), a painter of the Roman school, whose true name was Perino (or PIERO) BUONACORSI. He was born near Florence on the 28th of June 1500. His father ruined himself by gambling, and became a soldier in the invading army of Charles VIII. His mother dying when he was but two months old, he was suckled by a she-goat; but shortly afterwards he was taken up by his father's second wife. Perino was first apprenticed to a druggist, but soon passed into the hands of a mediocre painter, Andrea da Ceri, and, when eleven years of age, of Ridolfo Ghirlandajo. Perino rapidly surpassed his fellow-pupils, applying himself especially to the study of Michelangelo's great cartoon. Another mediocre painter, Vaga from Toscanella, undertook to settle the boy in Rome, but first set him to work in Toscanella. Perino, when he at last reached Rome, was utterly poor, and with no clear prospect beyond journey work for trading decorators. He, however, studied with great severity and spirit from Michelangelo and the antique, and was eventually entrusted with some of the subordinate work undertaken by Raphael in the Vatican. He assisted Giovanni da Udine in the stucco and arabesque decorations of the loggie of the Vatican, and executed some of those small but finely composed scriptural subjects which go by the name of "Raphael's Bible"—Raphael himself furnishing the designs. Perino's examples are: "Abraham about to sacrifice Isaac," "Jacob wrestling with the Angel," "Joseph and his Brethren," the "Hebrews crossing the Jordan," the "Fall and Capture of Jericho," "Joshua commanding the Sun to stand still," the "Birth of Christ," "His Baptism" and the "Last Supper." Some of these are in bronze-tint, while others are in full colour. He also painted, after Raphael's drawings, the figures of the planets in the great hall of the Appartamenti Borgia. Perino exhibited very uncommon faculty in the way of being able to see the two hands of Giulio Romano among the great painter's assistants. To Raphael himself he was always exceedingly respectful and attentive, and the master loved him almost as a son. He executed many other works about Rome, always displaying a certain mixture of the Florentine with the Roman style.

After Raphael's death in 1520 a troublesome period ensued for Perino, with a plague which ravaged Rome in 1523, and again with the sack of that city in 1527. Then he accepted an invitation to Genoa, where he was employed in decorating the Doria Palace, and rapidly founded a quasi-Roman school of art in the Ligurian city. He ornamented the palace in a style similar to that of Giulio Romano in the Mantuan Palazzo del Tè, and frescoed historical and mythological subjects in the apartments, fanciful and graceful arabesque work, sculptural and architectural details—in short, whatever came to hand. Among the principal works are: the "War between the Gods and Giants," "Horatius Coclès defending the Bridge," and the "Fortitude
of Mutius Scaevola." The most important work of all, the "Shipwreck of Aeneas," is no longer extant. From Genoa, Perino twice visited Pisa, and began some painting in the cathedral. Finally he returned to Rome, where Paul III. allowed him a regular salary till the painter's death. He retouched many of the works of Raphael, and laboured hard on his own account, undertaking all sorts of jobs, important or trivial. Working for any price, he made large gains, but fell into mechanical negligence. Perino was engaged in the general decoration of the Sala Reale, begun by Paul III., when his health, undermined by constant work and as constant irregularities, gave way, and he fell down dead on the 19th of October 1547. He is buried in the Pantheon.

Perino produced some excellent portraits, and his smaller oil pictures were executed with the manner of Raphael something of that of Adrea del Sarto. Many of his works were engraved, even in his own lifetime. Daniele Ricciarelli, Girolamo Siciolante da Sermoneta, Luzio Romano and Marcello Venusti (Mantovano) were among his principal assistants.

PERIN Thompson (Turk. Eski Eregli, old Heraclae), an ancient town of Thrace, on the Proponus, 22 m. W. of Selymbria, strongly situated on a small peninsula on the bay of that name. It is said to have been founded about 550 B.C. According to Tzetzes, its original name was Mytrops, after it was called Heraclae (Heraclae Thraciae, Heraclae Perinthus). It is famous chiefly for its stubborn and successful resistance to Philip II. of Macedon in 349; at that time it seems to have been more important than Byzantium itself.

PERIOD GR. περιοδος, a going or way round, circuit, perl round, and δος, way, road), a circuit or course of time, a cycle; particularly the duration of time in which a planet revolves round its sun, or a satellite round its principal, a definite or indefinite recurring interval of time marked by some special or peculiar character, e.g. in history, literature, art, &c.; it is so used as a division of geological time. Particular uses of the word are for the various phases through which a disease passes, the termination or conclusion of any course of events, the pause at the end of a completed sentence, and the mark (.) used to signify the same (see Punctuation).

PERIODICALS, a general term for literary publications which appear in numbers or parts at regular intervals of time—as a rule, weekly, monthly or quarterly. The term strictly includes "newspapers" (q.v.), but in the narrower sense usually intended it is distinguished as a convenient expression for periodical publications which differ from newspapers in not being primarily for the circulation of news or information of ephemeral interest, and in being issued at longer intervals. In modern times the weekly journal has become so much of the nature of a newspaper that it seldom can be called a periodical in this sense. The present article chiefly deals with publications devoted to general literature, literary and critical reviews and magazines for the supply of miscellaneous reading. In the article Societies (q.v.) an account is separately given of the transactions and proceedings of learned and scientific bodies. Year-books, almanacs, directories and other annuals belong to a distinct type of publication, and are not referred to here.

BIBLIOGRAPHICAL.—The first literary periodical in English was the Mercurius librorum or a Faithful Account of All Books and Pamphlets (1680), a mere catalogue, published weekly or fortnightly in London, followed by Weekly Memorials for the Ingenious (Jan. 16, 1681-1682 to Jan. 15, 1683), which was more of the type of the Journal des Savans (see under France below), whence it borrowed many contributions. Of the History of Learning (1691)—another with the same title came out in 1684—only a few numbers appeared, as the conductor, De la Lyra, had ceased to take part in the publishing. John Dunton, monthly Works of the Learned (Aug. 1691 to Apr. 1692) devoted himself exclusively to continental scholarship. The monthly Compleat Library (1692 to 1694) was a venture of John Dunton; the monthly Memoirs for the Ingenious (1693), edited by J. de la Crose, ran for 12 months, and another with the same title appeared in 1697-1712. John Ker, the Chief Justice, who was, like his father the first periodical of merit and influence was the History of the Works of the Learned (1699-1712), largely consisting of descriptions of foreign books. The Memoirs of Literature, the first English review consisting entirely of original matter, published in London from 1710 to 1714, had for editor Michel de la Roche, a French Protestant

refugee, who also edited at Amsterdam the Bibliotheca angliae (1717-1719), and subsequently Mémoires littéraires de la Grande Bretagne (1720-1724). Returning to England in 1725, he recommenced his Memoirs of Literature (1725-1728), a monthly, and in 1730 his Literary Register. He also started Bibliotheca literaria (1722-1724), to appear every two months, and was enriched with medals and antiquities as well as with literature, but only ten numbers appeared. The Present State of the Republic of Letters was commenced by Alexander Reid in January 1726, and continued in December 1736. It consisted mainly of reviews of English books but papers from the works of foreigners. Two volumes came out each year. It was successful, as also was the Historical Register (1730-1734) of Archibald Bower. The Bee, or Universal Weekly Post-Boy (1733-1735) of the unfortunate Horace Walpole, was also very short-lived, appearing only until 1734, when its place was taken by The Literary Journal (Dublin, 1744-1749), the first review published in Ireland. The Museum (1745) of R. Dodson united the character of a review with those of a literary and scientific journal. It was Whig in politics and Nonconformist in theology. The first issues ran from 1749 to December 1789, 81 vols.; the second from 1790 to 1815. 108 vols.; the third or new series from 1826 to 1830, 15 vols.; and the fourth from 1831 to 1845. 45 vols., when the magazine stopped. There is a general index (1749-1781) 3 vols., and another (1790-1816), 2 vols. The Tory party and the established church were defended in the Critical Review (1756-1760), founded by Archibald Hamilton and supported by Smollett, D. Johnson, and the royal patron. It contributed to fifteen numbers of the Literary Magazine (1758-1758). The reviews rapidly increased in number towards the end of the 18th century. Among the principal were the London Review (1775-1780), A New Review (1773-1779), the Edinburgh Review (1773-1790), incorporated in 1797 with the Analytical Review (1788-1799), the Anti-Jacobin Review and Magazine (1798-1821), and the British Critic (1793-1843), the organ of the High Church party, and first edited by Archibald Gilmore.

These periodicals had now become extremely numerous, and many of the leading London publishers found it convenient to maintain their own particular organs. It is not a complete list of the reviews in Quarterly, and the reviews of every sort of periodical have shrunk at times, but the reviews should have fallen somewhat in public estimation. The time was ripe for one which should be quite independent of the booksellers, and which should also aim at a higher level of article, with an equal amount of critical matter. L'Ami des Arts and others had produced an Edinburgh Review which only ran to two numbers, and in 1773 Gilbert Stuart and William Smellie issued during three years an Edinburgh Magazine and Review, afterwards the Edinburgh Review, established in October 1802 by Jeffrey, Scott, Horner, Brougham and Sydney Smith. It created a new era in critical periodism, and advocated a new tone and spirit of independence and self-criticism. The first editor was Sydney Smith, then Jeffrey for many years, and later editors were M'accurry Napier, William Empson, Sir G. C. Lewis, Henry Reeve and the Hon. Arthur Elliot. Its bluff and blue common sense, its belief in the duty of the critic to maintain his own independence, and its corrupting of the atmosphere of the political principles it advocated. Among its more famous contributors were Lord Brougham, Sir Walter Scott, Carlyle, Hazlitt and Macaulay. Scott, being dissatisfied with the new review, persuaded John Murray, his London publisher, to start its brilliant Tory competitor, the Quarterly Review (Feb. 1809), followed by the Edinburgh Pamphlet, then by Sir J. T. Coleridge, and subsequently by J. G. Lockhart, Rev. Whitwell Elwin, W. M. Macpherson, Sir Wm. Smith, Rowland Prothero and G. W. Prothero. Among the contributors in successive years were Canning, Scott (reviewed his life), Robert Southey,

1 Archibald Bower (1686-1766) was educated at Douai, and became a Jesuit. He subsequently professed himself a convert to the Protestant religion. He was the author of various works, and was more esteemed for his ability than for his moral character.

2 The biographers of Goldsmith have made us familiar with the name of Grifiths (1720-1803), the prosperous publisher, with his dictionary of L. D. granted by an American university, and with the quarrels between him and the poet.
Sir John Barrow, J. Wilson Croker, Isaac Disraeli, A. W. Kinglake, Lord Salisbury and W. E. Gladstone. The Westminster Review (1824), established by the followers of Jeremy Bentham, advocated radical reforms in church, state and legislation. In 1836 it was joined by the Monthly Review (1829) founded by Sir J. G. Lockhart, and then bore the name of the London and Westminster Review till 1851, when it returned to its original title. Other quarterly reviews worth mentioning are the Eclectic Review (1805-1868), edited down to 1834 by J. H. Clark; the Quarterly Review (1809-1818), founded by the Duke of Dorset; the British Review (1811-1825); the Christian Remembrancer (1819-1868); the retrospective Review (1809-1875), for old books; the Foreign Quarterly Review (1827-1840), afterwards incorporated with the Westminster; the Athenian Review (1824-1836), the Catholic organ; the Foreign and Colonial Quarterly Review (1843-1847); the Prospective Review (1845-1855), given up to theology and literature, previously the Christian Teacher (1835-1844); the North British Review (1829-1865); the successor to the British and Foreign Review (1835-1844); the New Quarterly Review (1852-1861), the Scottish Review (1853-1862), published at Glasgow; the Wescleyan London Quarterly Review (1846-1853); the Englishman (1850-1851), the Edinburgh Review (1855-1881); the Irish Quarterly Review (1851-1859), brought out in Dublin; the Home and Foreign Review (1862-1864); the Fine Arts Quarterly Review; the New Quarterly Magazine; the Catholic Times; the Caledonian Quarterly Review; the Westminster; the Anglican Church Quarterly Review (1875); Mind (1876), dealing with mental philosophy; the Modern Review (1880-1884); the Scottish Review (1882); the Asiatic Quarterly Review (1886); and since 1891 the Imperial and Asiatic Quarterly Review; and the Jewish Quarterly Review.

The monthly reviews include the Christian Observer (1802-1827), conducted by members of the established church upon evangelical principles, with Lachlan Macquarrie; the Monthly Repository (1806-1837), originally purely theological, but after coming into the hands of the Rev. W. J. Fox made entirely literary and political. The Fortnightly Review (1845), edited successively by G. H. Lewes, John Morley, T. H. Huxley; Crawford (1845-1850); the Nineteenth Century (1859), of which W. J. W. Peacock was the editor; the National Review (1847); the Westminster Review; the Nineteenth and After (in 1900), of which A. E. W. Maunder was the editor; and the Modern Quarterly Review (1888), the Indian Magazine (1871); the Irish Monthly (Dublin, 1872); the Irish Quarterly Review (1882); the African Review (1892) and the Empire Review (1899). The Monthly Review (1900-1908), edited till 1908 by W. H. B. Bynner, was for some years a notable addition to the high class literary monthlies.

The weekly reviews dealing generally with literature, science and art are the Literary Gazette (1817-1862), first edited by William Blackwood; the Athenæum (1828), edited first by Joseph W. Hodges (1838); the Examiner (1808-1881), the Spectator (1828), the Saturday Review (1855), the Scots or National Observer (1858-1859), Outlook (1898), Pilot (1900-1903), and Speaker (1899), which became the Nation.

The Westminster Journal (1723-1726), founded on the Edinburgh Review (1704-1713) dealt chiefly with politics and commerce, but the introduction in it of what its editor fittingly termed the "scandalous club," was another step nearer the papers of Steele and the periodical press afterwards. The first number of the Dublin Magazine was published in 1758, containing poems in matters of taste and manner. These little papers, rapidly thrown off for a temporary purpose, were destined to form a very important part of the literature of the 18th century, and in some respects its most marked feature. Although the frequenters of the clubs and coffee-houses were the persons for whom the essay-papers were mainly written, a proof of the increasing refinement of the age is that more and more men of letters took part. The 33rd volume of the London Magazine was published in 1758, the 34th in 1759, and the 35th in 1760, that of 1761 was devoted almost entirely to literature. There was a similar attempt in Edinburgh to found a literary periodical; the Edinburgh Magazine (1763) was published in 1764.

The Gentleman's Magazine Library, being a classified collection of the chief contents of the Gentleman's Magazine, from 1731 to 1868, is now being edited by Mr. G. L. Gomme (1883, &c., vols. 1-17).
to use the word magazine in the sense of a periodical of miscellaneous literature. The specially antiquarian, biographical and historical features, which make this magazine so valuable a storehouse for information for the period it covers, were dropped in 1868, when an entirely new series, the "Young Gentleman's Magazine," was successively edited by Gowling, Joseph Hatton and Joseph Knight.

Many other magazines were produced in consequence of the success of these two. It will be sufficient to mention the following: The Scottish Mercury, founded in 1730, lasted down to 1780. Of most lasting duration was the Royal National Magazine (1771) followed in 1771 by the Monthly Magazine (1796-1834), with which Fieschi and Godwin were originally connected. During thirty years the Monthly Magazine was edited by T. Colbourn, and John Galt and Samuel Warren. It has always remained a liberal and Conservative in politics. The New Monthly Magazine is somewhat earlier in date. It was founded in 1814 and it became, if not its chief, certainly one of its founders, Bentley’s Miscellany (1837-1868) was exclusively devoted to novels, light literature and travels. Several of Ainsworth’s romances, illustrated by Cruikshank, first saw the light in Bentley’s. The Edinburgh Magazine was written or edited by Cowper, Campbell, Theodore Hook, Bulwer-Lytton and Ainsworth. Many of Carlyle’s and Thackeray’s pieces first appeared in Fraser’s Magazine (1830), long famous for its personalities and its gallery of literary portraits. The Metropolitan Magazine was started in 1839, and was followed in 1840 by the British Monthly Magazine.

Indexes to English Periodicals. — A large number of periodicals do not preserve literary matter of permanent value, but the high class reviews and the archaeological, artistic and scientific magazines are exceptions. Many of the special indexes have become necessary to all literary workers. Lists of the separate indexes to particular series are given in H. B. Wheatley’s What is an Index? (1879). W. P. Courtney’s Register of National Libraries (1871), and E. G. Smith’s Bibliography of the Reference Library in the reading room of the British Museum (4th ed. 1910, 2 vols.).

PERIODICALS

UNITED STATES

The two earliest American miscellanies were produced almost simultaneously. Spurred by the success of the *Gentleman's Magazine* in England, Benjamin Franklin founded the *General Magazine* in 1741. Although it existed for only four years, it established the tradition of the popular periodical as a vehicle for the publication of literature, art, science, and politics.

The *American Magazine* (1743–1747), in imitation of the *London Magazine*, was edited by John Webbe, who ran it only to two numbers. Further attempts at Philadelphia by Joseph Mullaney (1727–1730) and Robert Hay (1735–1739) met with the same fate.

The pre-revolutionary periodicals were the *Boston American Magazine* (1743–1747), a collection of fugitive pieces; the *Boston American Magazine* (1747–1775); and the *Pennsylvania Magazine* (1777–1776), founded by the Provincial Congress to aid in the support of the colonies.

The *New England Magazine* (1786–1790) was continued as the *Universal Asylum* (1790–1792). Matthew Carey brought out the *American Museum* in 1787, and it lasted until 1792. Among the other magazines which ran for a short time between 1795 and 1806 were the *Philadelphia Political Censor* or Monthly Review (1795–1796) edited by William Cobbett. One of the most successful was the *Farmer's Weekly Museum* (1790–1799), supported by perhaps the most brilliant staff of writers. American periodical literature had not been brought to its heights by 1810 when the publication of the *Portfolio*, carried on to 1827 at Philadelphia.

For five years it was a weekly miscellany in quarto, and afterwards an octavo monthly; it was the first American serial which could be said to be a periodical in the modern sense. One of its chief editors was James Fenimore Cooper. Another was the *Monthly Anthology and Boston Review* (1803–1811), the former editor of the *North American Review*. In the year 1810 Thomas (Priming in America, ii. 292) informs us that 27 periodicals were issued in the United States. The first of these was the *American Magazine* (1813–1820), founded at Philadelphia by Moses Thomas, with the literary assistance of W. Irving (for some time the editor). Faulding, and the ornithologist Wilson. In spite of a large subscription list in the first year, one-third of the costly style of its production. The first southern serial was the *Monthly Register* of Charleston. New York possessed no periodical worthy of the city until 1824, when the *Atlantic Monthly* appeared, which changed its name shortly afterwards to the *New York Monthly Review*, and was supported by R. C. Sands and W. C. Bryant. N. P. Willis was one of the editors of the *New York Mirror* (1823–1842). Between 1840 and 1850 Graham's Magazine was the most influential of the many miscellaneous periodicals published; in one year a circulation of about 35,000 copies. The first western periodical was the *Illinois Monthly Magazine* (1830–1832), published, owned, edited and almost entirely written by James Hall, who lived a few miles from Keokuk, and who died in 1850. The next one to come was the *Analytic Magazine* (1831–1832), founded at Philadelphia by Moses Thomas, with the literary assistance of W. Irving (for some time the editor). Faulding, and the ornithologist Wilson. In spite of a large subscription list in the first year, one-third of the production was contributed. Equally popular was Putnam's *Monthly Magazine* (1835–1857, 1867–1869). It was revived in 1860–1861. The *Dial* (1840–1844), Boston, the organ of the transcendentalists, was first edited by Margaret Fuller, and subsequently by R. W. Emerson and C. R. Riggs. Other magazines of interest were the *Philadelphia Monthly Magazine* (1833–1838), the *Southern Literary Messenger* (1834), Richmond, the *Gentleman's Magazine* (1837–1840), and the *International Magazine* (1850–1852), edited by R. W. Griswold. The *Fate Literary Magazine* dated from 1871 and was characterized by cheapness and a chronic lack of books for the reader. The *Commercial and Financial Chronicle* in first order of date among the current monthly magazines comes the *New York Harper's New Monthly Magazine* (1850), the earliest existing illustrated American periodical. This has been followed by the *Galaxy* (1865), and the *Godey's Lady's Book and Magazine* (1860–1900), which has the distinction of being the oldest American magazine in continuous publication. The *Puck* (1872), the *Cassier's Illustrated Magazine* (1875), the *Cosmopolitan* (1888), the *Harper's Monthly* (1890), the *Saturday Review of Literature* (1873), and the *Scientific American* (1850) have given the publishers good returns for their yearly expenditure.

Many serial publications have been almost entirely made up of extracts from English sources. Perhaps the earliest example is to be found in *Select Views of Literature* (1811–1812). The *Eclectic Magazine* (1844) and *Lilient's Literary Age* (1844) may be mentioned.

In 1817 America possessed only one geological periodical, the *Journal of Mineralogy*. Professor Silliman established the journal known by his name in 1818. Since that time the *American Journal of Science* has enjoyed unceasing favour. The special periodicals dealing with mechanical engineering are: the *Popular Science Monthly*, New York; the *Boston Journal of Education*; the quarterly *American Journal of Mathematics*, Baltimore; the monthly *Cassier's Magazine* (1861), New York; the monthly *Scientific American* (1861), New York; the *Johnston's House and Garden*, Philadelphia; the monthly *Astrophysical Journal*, commenced as *Sidereal Messenger* (1882), Chicago; the monthly *American Chemical Journal*, Baltimore; the monthly *American Journal of the Medical Sciences*, Philadelphia; the *Monthly Outing*, New York; the *American Agriculturist*, New York; the quarterly *Metaphysical Magazine* (1845), New York; the bi-monthly *American Journal of the Social Sciences*, Philadelphia; the monthly *Banker's Magazine*, New York; the quarterly *American Journal of Philology* (1880), Baltimore; the *Monthly Library Journal* (1876), New York; the monthly *Public Libraries*, Chicago; the *Weekly Reader*, New York; the quarterly *American Journal of Archaeology* (1885), New York.

The number of periodicals devoted to light literature and to female readers has been, and still remains, extremely large. The earliest
in the latter class was the Lady's Magazine (1792) of Philadelphia.

The Lowell Offering (1841) was written by factory girls of Lowell (g.v.), Mass. Godey's Lady's Book was long popular, and the Ladies Home Journal (1883) and the Woman's Home Companion (1893) are now current. Children's magazines originated with the Young Misses' Magazine (1860) of Brooklyn; the New York St Nicholas (monthly) and the Boston Youth's Companion (weekly) are yearly juveniles.

The total of American periodicals mentioned in the Guide by H. O. Salton and C. H. Walsh (1909, Ann Arbor), is 5136 for the year 1908.

Indexes to Periodicals.—The contents of English and American periodicals of the last 100 years are indexed in the following publications: W. F. Poole's Index to Periodical Literature (1802-1881, revised 1903). The Workhouse (1893-1907), edited by W. I. Fletcher and W. J. Poole; W. I. Fletcher (1874), 2nd supplement, 1887-1892, by W. I. Fletcher, 3rd supplement, 1892-1896, by W. I. Fletcher and F. O. Poole, 4th supplement, 1897-1902, 5th supplement, 1903. The Workhouse (1893-1907), edited by W. I. Fletcher and M. Poole (Boston, 1901); 1st supplement, 1900-1903, (Boston, 1905); The Co-operative Index to Periodicals (1885-1894, ed. W. I. Fletcher, 1886-1894); The Annual Library Index, including Periodicals, by G. E. Bateman (New York, 1897-1902); "Index of Periodicals for 1890," in (Review of Reviews), by Miss Hetherington (13 vols., 1890-1902); O. P. Indexes; Contraceptive Subject Index to General and Periodical Literature (1900); Canadian Index to a Selected List of Periodicals, in the Canadian Periodicals Review, by W. H. Smith (1st ed., 1903) with the Reader's Guide to Periodical Literature (8 vols., 1901-1908, ed. A. L. Guthrie, Minneapolis, U.S.); Magazine Subject Index, by F. W. Faxon (Boston, 1908), continued quarterly in Bulletin of Bibliography, which in 1919 was a magazine subject index; Eclectic Library Catalogue (Minneapolis, 1908), issued quarterly.

Canada

Canadian periodicals have reached a higher standard than in any former British (2nd ed., 1896). Like that of South Africa, the press is bilingual. The first Canadian review, The Quebec Magazine (1791-1793), was published quarterly in French and English. It was followed by the British American Register (Queller, 1803), L'Abrielle canadienne (Montreal, 1816), edited by H. M. Langlois; The Montreal Gazette and the Canadian Review (Montreal, 1824-1826); La Bibliothèque canadienne (Montreal, 1825-1830), continued as L'Observateur (1830-1831), and The Magasin du Bas-Canada (Montreal, 1832), the three latter being edited by J. A. Mercier; The Literary Garland (Montreal, 1838-1840), edited by John Gibson, was for some time the only English magazine published in Canada. Later magazines were L'Echo du cabinet de lecture parissien (Montreal, 1839), 15 vols.; Le Foyer canadien (Quebec, 1836-1866), one of the most interesting French-Canadian reviews; La Revue canadienne, which was started at Montreal in 1864, and continued the best writings of contemporary French-Canadian literateurs; La Revue de Montreal (1865-1870), and Le Pèlerin (Montreal, 1875-1880), both published by the University of Montreal; Le Mercure canadien (Quebec, 1888-1891), edited by the staff of the Laval University, and Canadienne (1889-1890), were important historical and literary reviews. Contemporary magazines are the Canadian Magazine (Toronto, 1863), the Westminister, both produced at Toronto; La Nouvelle-France (Quebec), the Canada Monthly (London, Ontario), and the University Magazine, edited by Professor MacPhail, of the McGill University.

South Africa

The earliest magazine was the South African Journal, issued by the poet Pringle and John Fairbairn in 1824. It was followed by the South African Quarterly Journal (1829-1834), the Cape of Good Hope Literary Gazette (1830-1833), edited by A. J. Jardine, the Cape of Good Hope Literary Magazine (1842-1848), edited by J. L. Fitzpatrick, and the Eastern Province Monthly Magazine, published at Grahamstown in 1857-1858. A Dutch periodical called Elpis, algemeen tijdschrift voor Zuid Afrika (1857-1861) appealed to the farming community. The Eastern Province Magazine was founded at Port Elizabeth in 1861-1862, and the South African Magazine appeared in 1867-1868. The Orange Free State Magazine, the only English magazine published at Bloemfontein, was issued in 1877-1878; and the South African Magazine was founded in 1892-1897. The Cape Monthly Magazine, the most important of the periodicals, was issued from 1892 to 1897, and was again continued under the editorship of Professor Noble from 1870 to 1881. The Canadian Illustrated Monthly Magazine was founded by Professor J. G. Still in Durban the Present Century was started in 1903, and the Natal Magazine was issued at Pietermaritzburg in 1877. The weekly New Era (1904-1905) was succeeded by the South African Magazine (1906). The South African Magazine (Grahamstown, 1897) and the South African Magazine (Cape Town, 1909) are monthly reviews, while the South African Railway Magazine (1907) is of wider interest than its name denotes.

South Africa

The South African Bibliography (Sydney, 1893); G. B. Barton, Literature of N. S. W. (1860); E. A. Petherick, Catalogue of Books Relating to Australasia (1889).

Victoria.—The Port Phillip Magazines (1843) must be regarded as the first magazine of Victoria. This was followed by the Australia Felix Magazine (1849), and the Australasian Quarterly Reprint (1850-1851) both published at Geelong, the Illustrated Australian Magazine (1850-1852), the Australian Gold-Digger's Monthly Magazine (1852-1853), and the Melbourne Monthly Magazine (1855-1856). The Journal of Australasia (1856-1858), the Australian Monthly Magazine (1865-1867), which contained contributions from Marcus Clarke and was continued as the Australasian Review (1867-1869) and the Viktorian Review (1876-1885) and the Victorian Review (1876-1885) and the Victorian Review (1876-1885) may also be mentioned. The Imperial Review, apparently the work of one pen, has been published since 1879; the Pastoralist's Review appeals to the agriculturist, and the Australasian Record of Australasia was published in 1901-1902. An Australian edition of the Review of Reviews is published at Melbourne.

See Some Magazines of Early Victoria, in the Literary Record of Australia, Nos. 2-4 (1901).
Louis Auguste de Bourbon, sovereign prince of Dombes, having transferred his parliament to Trévoux, set up a printing press, and was persuaded by two Jesuits, Michel le Tellier and Philippe Lalleman, to establish the Mémoires pour servir à l'histoire des sciences et des arts (1701-1747), more famous in its day than other journals of the same period. The Progresses de la Royaume, ou les sciences, des arts (1779-1872) by the abbé Grosier.

The first legal periodical was the Journal du palais (1672) of Claude Blonay, who was Gueule, and the first devoted to medicine before the Newélles découvertes dans toutes les parties de la médecine (1679) of Nicolas de Bligny, frequently spoken of as a charlatan, a term which sometimes means simply a man of many ideas. Religious periodicals were started by the abbé Roque, to whom is also due the first medical journal (1683).

The prototype of the historico-literary periodical may be discovered in La Clef du cabinet des princes de l'Europe (1704-1706), familiarly known as Journal de Verdun, and carried on under various titles down to 1718.

Literary criticism was no more free than political discussion, and no person was allowed to trespass either upon the domain of the Journal des savants or that of the Mercure de France (see News- Paper). It is, however, certain that the first literary journal was that of the Stuart origin of the clandestine press of Holland, and it was that country which for the next hundred years supplied the ablest periodical criticism from the pens of French Protestant refugees. During that period some thirty journals were published on these themes. From its commencement the Journal des savants was pirated in Holland, and for ten years a kind of joint issue made up with the Journal des Savants appeared at Amsterdam. From 1764-1775 miscellaneous articles from different French and English reviews, and indexed to order, were published. Bayle's method was followed in an equally meritorious periodical, the Histoire des ouvrages des Savans (1687-1704) of H. Bassenge de Beauval. Another continuator of Bayle was Jean Leclerc, one of the most learned and acute critics of the 18th century, who carried on three reviews—the Bibliothèque universelle et historique (1686-1693), the Bibliothèque choisie (1703-1713), and the Bibliothèque universelle et moderne (1713-1725). This journal and its successor, entitled the same title, brought together in one body, and, besides valuable estimates of new books, include original dissertations, articles and biographies like our modern learned magazines.

The Journal littéraire (1713-1722, 1729-1736) was founded by a band of young men, who made it a rule to discuss their contributions anonymously. One of these, abbé de la Roque, carried on the Histoire des ouvrages des Savans, and was followed, in the Bibliothèque universelle et historique (1764-1778), by the Mémoires littéraires de la Grande Bretagne (1720-1724), the Bibliothèque britannique (1733-1734), and the Journal britannique (1750-1757) of Maty, a member of the Académie des Sciences. He combined the offices of editor, learned critic, and poet, under the assumed name of the sieur d'Hedouville. The prospectus promised to give an account of the chief books published throughout Europe, obituary notices, a review of the progress of science, and such legal and ecclesiastical information and other interest to cultivated persons. The criticisms, however, wounded alike authors and the clergy, and the journal was suppressed after a career of three months. Colbert, seeing the public utility of such a periodical, appealed to the minister of the royal instructions to re-establish it, an event which took place on the 4th of January 1666. It lingered nine years under the new editor, who was re-appointed in 1675 by the abbé de la Roque, and the latter in his turn by the president Cousin, in 1686. From 1701 commenced a new era for the Journal, which was acquired by the chancellor de Pontchartrain for the state and placed under the direction of a commission of learned men. Just before the Revolution it developed fresh activity, but the troubles of 1792 caused it to be dissolved. The editors desired to continue it under the same name, but for the number of 1794 new regulations had been issued. In 1816 it was definitely re-established and replaced under government patronage, remaining subject to the chancellor or garde-des-sceaux until 1857, when it was transferred to the control of the minister of public instruction. Since 1903 the organization of the publication has changed. The state subsidy having been withdrawn, the Institute voted a yearly subscription of 10,000 francs and nominated a commission of five members (see Dict. françois, each section, who managed the Journal. Since 1909, however, the various sections have left to the Académie des Inscriptions et Belles Lettres the entire direction of the Journal, while still paying the annual subsidy. It now restricts itself to publishing contributions relating to antiquities and the middle ages and Oriental studies.

1 Matthew Maty, M.D., born in Holland, 1718, died principal librarian of the British Museum, 1776. He settled in England in 1740, published several books, and wrote the preface to Gibbon's first work, Étude de la littérature.
Oriental, with the title of *Turkish Spy, Lettres chinoises, &c.* These productions were usually issued in periodical form, and, besides an immense amount of worthless tit-tattle, contain some valuable matter.

During the first half of the century France has little of importance to show in periodical literature. The *Novelles éclaustiques* (1728–1803) were first printed and circulated secretly by the Jansenists in opposition to the *Constitution aménités*. The Jesuits redoubled their attack with the *Nouvelles éclairées* (1744–1748). The promising title may have had something to do with the temporary success of the *Mémoires secrets de la république des lettres* (1744–1748) of the marquis d’Argens. In the *Observations sur le commerce* (1735–1743) Desfontaines held the gates of the new commerce opened by Diderot; his *Philosophie de la vie privée* for eight years held the disputants and the redoubtable Voltaire himself. It was continued by the *Jugements sur quelques ouvrages nouveaux* (1744–1745). The name of Fréron, perhaps the most vigorous enemy Voltaire ever encountered, was long connected with the *Lettres frangaise* (1745–1754), followed by *L’Année littéraire* (1754–1790). Among the contributors of Fréron was another manufacturer of criticism, the abbé de la Porte, who, having quarrelled with his confère, founded *Observations sur la littérature moderne* (1749–1752) and *L’Observateur littéraire* (1758–1761).

A number of special organs came into existence about this period. The first, treating of agriculture and domestic economy, was the *Journal de commerce* (1772–1773). This journal was founded in 1759; periodical biography may be first seen in the *Nécrologie des hommes célèbres de France* (1764–1782); the political economists established the *Éphémérides du citoyen* in 1765; the first *Journal des économistes* was founded in 1768; *La mode* in the same year; the theatre had its first organ in the *Journal des théâtres* (1770); in the same year were produced a *Journal de musique* and the *Encyclopédie militaire*; the sister service was supplied by *La revue de mode* in 1778. We have already noticed several journals specially devoted to one or another branch of literature. It was left to Fréron, Grimm, Prevost and others in 1754 to extend the idea to all foreign productions, and the *Journal étranger* (1754–1762) was founded for this purpose. The *Gazette littéraire* (1792–1804) and *Diderot et ses contemporains* (1766–1770), edited by Lambert among its editors, was intended to swell the small fry by criticism; the *Journal des dames* (1759–1775) was of a light magazine class; and the *Journal de monsieur* (1776–1783) had three chief architects, the duke of Chaulnes and two others. The *Mémoires secrets pour servir à l’histoire de la république des lettres* (1762–1763), better known as *Mémoires de Bachaumont*, from the name of their founder, furnish a minute account of the social and literary life of France during a period of two and six years. Of a similar character was the *Correspondance littéraire secrète* (1774–1793), to which Mètra was the chief contributor. L’Esprit des Journaux (1772–1781) forms an important literary and historical collection, which is rarely to be found complete.

The movement of ideas at the close of the century may best be traced in the *Annales politiques, civils, et littéraires* (1777–1792) of Linquet. The *Décade philosophique* (year v., 1790–1797), founded in 1790, was the first organ of the magazine class which appeared after the storms of the Revolution. The idea grew and of resurrection of good taste; under the empire it formed the sole refuge of the opposition. By a decree of the 17th of January 1800 the number of Parisian journals to thirteen, of which the *Décade* was one; all the others, with the exception of those dealing solely with science, art, commerce and advertisements, were suppressed. A report addressed to Bonaparte by Falloux, in 1801, (1802–1806) furnishes a list of fifty-one of these periodicals. In the year XI 1801 (1804–1805) only seven non-political serials were permitted to appear.

Between 1815 and 1839 there was a constant struggle between freedom of thought on the one hand and the censure, the police and the authorities on the other. It was expressed in the device of “semi-periodical” publications, of which La *Minerve française* (1818–1820) was an instance. It was the Satire Minipée of the Restoration, and was brought out four times a year at irregular intervals. La *Minerve* was followed by *La Réforme* (1820), another anti-royalist organ. The censure was re-established in 1820 and abolished in 1828 with the monopoly. It has always seemed impossible to carry on successfully in France a review upon the plan of the English *Edinburgh Review* and important, and in England. The *Revue britannique* (1825–1901) had, indeed, a short career. The short-lived *Revue française* (1828–1836), founded by Guizot, Rémusat, De Broglie, and the doctrinaires, was an attempt in the same direction. The *Annales des deux mondes* was established in 1829 by Sœur-Dupuyeron and M. de la Signorini. The paper appeared at the end of the year, and its actual existence dates from its acquisition in 1831 by François Bulot, a masterful editor,

1 The novelist and publicist Joseph Fiévé (1767–1839), known for his relations with Napoleon I., has been made the subject for a study by Sainte-Beuve (Cassiers, v. 172).

2 The remarkable man (1804–1872) began life as a shepherd. Educated through the charity of M. Naville, he came to Paris as under whose energetic management it soon achieved a world-wide reputation. The most distinguished names in French literature have been among its contributors, for whom it has been styled the "vestibule of the Academy." It was preceded by a few months by the *Revue de Paris* (1824–1845), founded by Véron, who introduced the novel to periodical literature, in 1824. It was purchased by Bulot, and brought out concurrently with his own *Revue*. While the former was exclusively literary and artistic, the latter dealt more with philosophy. The *Revue indépendante* (1841–1848), established by Montalembert and De Falloux, the *Revue contemporaine* (1852–1895), founded by the comte de Belval as a royalist organ, joined to it in 1856 the *Ateneum français*. The *Revue germanique* (1878) exchanged its exclusive name and character in 1880. The *Revue de finances* (1859) was at first subordinated, like the *Revue contemporaine*, from which it soon withdrew government favour. The *Revue nationale* (1860) appeared quarterly, and succeeded to the *Magasin de Paris* (1858).

The number of French periodicals, reviews and magazines has enormously increased, not only in Paris but in the provinces. In Paris the number of periodicals published in 1883 was 1379; at the end of 1900 there were more than 3500 of all kinds. The chief French periodicals are arranged in the following order. The list includes a few no longer published.

**Archaeology.**— *Revue archéologique* (1860), bi-monthly; *Ami des monuments* (1887); *Bulletin de numismatique* (1914); *Revue bibliographique* (1900); *Revue de l'histoire de l'art* (1877); *Revue de l'histoire des monument* (1874); *Revue de l'histoire naturelle* (1872); *Revue d'histoire des lettres et des arts* (1875); *Revue d'histoire de la Révolution française* (1876); *Revue d'histoire de la monarchie* (1874)...

**Bibliography.**— *Annales de bibliographie philologique* (1888); *Le bibliographe moderne* (1897); *Bibliographie ancienne* (1893); *Bibliographie scientifique* (1902); *Bulletin des bibliothèques publiques* (1885); *Feuille de bibliographie* (1893); *La bibliographie et la science* (1893); *La bibliographie des revues* (1894); *La bibliographie des revues modernes* (1894).

**Geography.**— *Annales de géographie* (1892)...

**History.**— *Annales de l'histoire* (1875)...

**Law and Jurisprudence.**— *Annales de droit commercial* (1877)...

**Literary Reviews.**— *La Revue de Paris*, fortnightly (1850)...

1. This remarkable man (1804–1872) began life as a shepherd. Educated through the charity of M. Naville, he came to Paris as
both serious rivals of the Revue des deux mondes; Revue française d'Édimbourg (1897); Revue germanique (1905); Le Livre (1880), dealing with bibliography and literary history, and La Revue latine (1902), no longer published; La Revue, monthly.

After editing about thirty volumes Mencke died, leaving the publication of his series in the possession of the family down to 1745, when they extended to 117 volumes, which form an extremely valuable history of the learning of the period. A selection of the dissertations and articles was published as Veröffentlichungen der Menckeschen Akademie.

The Ephemerides litterariae (1868) came out at Hamburg in Latin and French. The Nova litteraria maris Baltici et Septentriones (1698-1708) was more especially devoted to north Germany and the University of Rostock. Of the Deutsche Monatliche Unterredungen (1698-1699), supported by the Oppenheimers, and treating various subjects in dialogue form, after the death of Mencke the Bibliothek was carried on under different names. V. Weck, J. G. Krause and others, down to 1721. Of much greater importance than the above-mentioned, was the curious Bibliothek, or Curieuze Bibliothek, and treating various subjects in dialogue form. In 1692, J. G. Eccard published, and many other periodicals, edited by the Landesbibliothek, and the Guntundigena of the latter, published at Halle (1715-1723), in German by the editor, contained a miscellaneous collection of juridical, historical and theological observations and dissertations.

The rest of the departments of learning possessed their several periodicals, published at various organs of the 18th century. The Anni franciscanorum (1680) was edited by the Jesuit Siller; and J. S. Adami published, between 1690 and 1715, certain theological repertories under the name of Deliceti. Historia ecclesiastica internationalis (1710-1727), conducted by the Schulze, and supported by the foundation of its opposite, was the Monatliche Erzählungen (1689) also devoted to natural science.

To the early part of the 18th century Halle and Leipzig were the chief organs of German literature. In Germany, other centres began to feel the need of such organs of science as Hamburg had its Niedersächsische neue Zeitungen, styled from 1731 Niedersächsische Nachrichten, which came to an end in 1736, and Mecklenburg; and in England, besides others brought out at Rostock. Prussia owes the foundation of its journals, which are still in existence, to G. P. Schultze and M. Lilienthal, the former of which is called Göttingische Allgemeine Zeitung (1772), and the latter, with the Elisabettenes Preussen (1724), and was the sole editor of the Acta boeciae, and Silesia also had their special periodicals in the first quarter of the 18th century. Franconia commenced with Nova litteraria, and published under the title Kurze Historie, both in 1725. In South Germany appeared the Württembergische Göttingische Allgemeine Zeitung, founded by J. G. Krause at Leipzig and carried on by various editors down to 1797. It was the first attempt to apply the form of the weekly political journal to learned subjects, and was imitated in the Verhörrung, founded by G. F. Meier (1721), both founded by J. G. Francke in Halle. Shortly after the foundation of the university of Göttingen appeared Zeitungen von gelehrten Sachen (1739), still famous as the Göttingische gelehrte Anzeigen, which during a long life. The editorial career has been conducted by professors of that university, and among others by Haller, Heyne and Eichhorn.

Influenced by a close study of English writers, the two Swiss, Bopp, untenrichter and Breitinger, founded the Meister (1721), and by paying more attention to the matter of works than to their manner, commenced a critical method new to Germany. The system was attacked by Gottsched, who, educated in the French schools, was in the direction of the French, but German criticism of the higher sort can only be said by being ready to begin with Lessing. The Berlin publisher Nicolai founded the Bibliothek der gelehrten Wissenschaften, and afterwards handed it over to C. F. Weisse in 1759, and the periodical called die neueste Literatur betrüfend (1759-1765), carried on by the help...
of Lessing, Mendelssohn and Abt. To Nicolai is also due the Allgemeine deutsche Bibliothek (1765-1806), which embraced a much wider field and soon became extremely influential. Herder founded the Morgenblatt (1782-1787), Der deutsche Merkur (1773-1780, revived 1790-1810) of Weil und der Monat (1827-1846), which was the French school of criticism. A new era in German periodical literature began when Burtch brought out at Jena in 1785 the Hochland weekly; Wissen list the successful. With the death of Henze, it was replaced by the Jenaische allgemeine Literaturzeitung, founded by Eichstädt. Both reviews enjoyed a prosperous career down to the opening of the 19th century.

At the beginning of the 19th century we find the Erlanger Literaturzeitung (1799-1810), which had replaced a Gelehrte Zeitung (1746); the Leipziger Literaturzeitung (1800-1835); the Heidelberger Monatsblätter für Literatur und Kunst (1834); and the Wiener Literaturzeitung (1801-1805), both of which received governmental support and resembled the English Quarterly Review in their conservative politics and high literary tone. Hermes, founded at Leipzig in 1817, was conducted by W. T. Humboldt, who was to become an influential literary figure. One of the most important periodicals of the 19th century was the Deutsche Allgemeine Zeitung (1827-1846), first published by Cotta. The Holzsäckische Jahrbücher (1838-1842) were founded by Ruge and Echtermeyer, and supported by the government. The Repertorium der deutschen und ausländischen Periodische, which was established by Gerdsdorf in 1834, and known after 1843 as the Leipziger Repertorium der deutschen und ausländischen Literatur, existed for one year (1842). Another Jahrbücher founded the Literaturzeitung at Berlin in 1834. It was conducted by F. W. Eichstädt up to 1837. The principal political troubles of 1838 and 1849 were most disastrous to the welfare of the literary and miscellaneous periodicals. Gerdsdorf's Repertorium, the Monatshefte für Literatur, Wissenschaft und Kunst, the Allgemeine Monatschrift für Literatur (1850), conducted after 1851 by Nietzsche and others, continued only down to 1854; the Literarische Wochenschriften (1850) is still published. The Blätter für literarische Unterhaltung (1853), the Literarische Verzeichnisse (1851-1852), the Germanische Monatsschrift (1853) and the Zeitschrift für die Literatur der technischen Journalliteratur (1874); Theology: Theologischer Jahrbuch (1881); Bibliographie der Kirchengeschichtlichen Literatur (1877).

Austria

The most notable periodicicals of a general character have been the Wiener Jahrbücher der Literatur (1818-1848) and the Oester-

Figure 19: "Theatrical Literature: Dramaturgie: Das Hamburger Theater (1808); the Jenaische Allgemeine Theaterzeitung (1810); the Deutsche Theaterblätter (1827); the Theaterzeitungen; the Deutsche Theaterzeitung (1827)."

ITALY

Prompted by M. A. Ricci, Francesco Nazarelli, the future cardinal, established in 1668 the Giornale delle letterature upon the plan of the French Journal des savants. His collaborators each agreed to undertake the artificial one by one, and Nazarelli retained the general editorship and the analysis of the French books. The journal was continued to 1675, and another series was carried on to 1709.

In the same year, 1668, Giacomo della Porta founded the Archivio della Accademia dei Lincei at Rome, in imitation of the Accademia dei Lincei at Florence, the official organ of librarians and archivists.

of French-speaking Switzerland, the Bibliothèque universelle (1816), which has also had a scientific and a literary series. The Revue suisse (1838) was produced at Neuchâtel. Two of these have been amalgamated and appear as the Bibliothèque universelle et revue suisse (1878); it contains much on the arts and letters of Switzerland and Switzerland, and is published by the Ouest-Français.

HOLLAND

The first serial written in Dutch was the Boekhale van Europa (1602-1708, and 1715-1748), which had several changes of name

PERIODICALS
Sweden

The Svenska Argus (1733-1734) of Olof Dalin is the first contribution of Sweden to periodical literature. The next were the Tidningar om den Lärda Arbeten (1732) and the Lärda Tidsningar. The patriotic journalist C.G. Gyllenborg published about national periodicals of which the most important was the Svenska Mercator (1755-1789). Attorned and some fellow-students founded about 1810 a society for the delivery of the country from French influence, the Sällskapet för de Norska musen, which endured the period of the Napoleonic Wars. It took the name of Phosphor (1810-1813), to propagate the opinions of Schlegel and Schelling. The Sveriges Tidskrift (1813-1825) of Palmblad and the Polyphon (1810-1812) had the same objects. Among later periodicals published during the 19th century may be mentioned the Afhandlingar (1831), the Skandinaviska Studier (1835-1838), the Norske Stiftelsers Tidsskrift (1850-1869), and the Nordiska Tidningen (1868-1870), two of which first introduced wood-engraving. Representative current periodicals are: Sveriges Nya Tidningar, monthly; Elektronisk tidskrift, monthly; Norden, quarterly; and Utrikes, monthly; Ud; Norgea.

Spain

Spain owes her intellectual emancipation to the monk Benito Félyó, who in 1726 produced a volume of dissertations somewhat after the fashion of the Spectator, but on graver subjects, entitled Teatro crítico, which was continued down to 1739. J. Cartas de descanso (1732-1790); El Diario gente (1737-1742), kept up at the expense of Philip V., did not long survive court favour. Other periodicals which appeared in the 18th century were: El Mejor Mercado (1738); El Diario mercantil (1737-1742); El Correo literario (1786-1791), devoted to literature and science; and the special organs El Correo mercantil (1792-1798); and El Semanario de agricultura (1797-1805). In the 19th century were: El Correo industrial (1839); El Correo de noticias científico-militares (1839-1842); and El Correo de noticias literarias (1842-1843). Some of the distinguished Spanish authors of the 18th century include: the brothers Aquinor; Revista de Catalunya, published at Barcelona; and El Correo mercantil (1853), published at Madrid.

Norway

The first trace of the serial form of publication to be found in Norway is in the Utgave-karte Afhandling (1750-1761), a weekly periodical founded by Fr. A. B. Frisk, which contained a number of important articles on theology and literary essays. The Maattegilde Afhandling (1762), "Monthly Treatises," was supported by several writers and devoted chiefly to rural economy. These two were followed by Politik og Historie (1802), a monthly periodical conducted by T. S. F. Munch; Den norske Tidsskrift (1817-1821), a miscellany brought out at Bergen; and Hermoder (1821-1827), a weekly aesthetic journal; Fladum, (1822-1823), of the same kind but of less value, Vidar (1823-1845), a weekly literary and scientific review; and Norske Magazine (1817-1846), of the same kind; Norsk Tidsskrift for Videnskap og Literatur (1847-1855); Illustrert Nyhedskal (1851-1866), "Illustrated News"; Norske Maattegilde (1856-1860), "Monthly Review for Norway," devoted to history and philosophy; and Norden (1866), a literary and scientific periodical. Popular serials date from the Skilling Magasin (1853), which first introduced wood-engraving. Representative current periodicals are: Selskabets tidskrift, months; Elektronisk tidskrift, monthly; Natur og kunde, monthly; and Utrikes, monthly; Utrikes, monthly; and Ud; Norgea.

PORTUGAL

Portugal could long boast of only one review, the Jornal enciclopédisco de Lisboa, which was brought out at Lisbon from 1727 to 1773, and was followed by the Jornal de Coimbra (1780-1782); the Jornal de Lisboa, which was founded by Herculano; and the Revista universal ibero-americana (1841-1853), established by Castilho; the Instituto (1853) of Coimbra; the Archivo filosófico y literario (1857) of Lisbon; and the Jornal das missões dos amigos das letras. In 1860 a new periodical called Vos feminins was conducted by women, was established at Lisbon. Current periodicals include: O Arquivo portugues (1865); Jornal de ciências matemáticas e industriais; a. Jornal da literatura, de arte e de literatura; Archivo literario, de arte e de literatura; and Archivo de cultura portuguesa, montly.

GREECE

The periodical literature of modern Greece commences with "O λόγος Ερήμων," brought out at Vienna in 1811 by Anthimos Gazi, who was the first republican. It was followed in 1812 by the "Ologos" (1812-1831), edited by Moustoxis; and at Corfu, in Greek, Italian and English, the "Αντολογία" (1834). After the return of King Otho in 1833 a literary review called "Παρθένια" (1834) was commenced. Le Spectateur de l'Orient, in French, pleased the national cause before Europe for three years from 1835. A military journal was published at Athens in 1855, and two years later the archaeological periodical conducted by Pitrakis and Ranganes. For many years Παύλος (1836-1837) was the leading serial. Παύλος dealt with natural science, the Geology, and Agriculture, and with the "Ανθλογία, Ερευνήσια" (1831) and "Φαληρικά σύλλογος" (1830) appear annually, one of which is a leading serial. Παύλος dealt with natural science, the Geology, and Agriculture, and with the "Ανθλογία, Ερευνήσια" (1831) and "Φαληρικά σύλλογος" (1830) appear annually, one of which is a leading serial. Παύλος dealt with natural science, the Geology, and Agriculture, and with the "Ανθλογία, Ερευνήσια" (1831) and "Φαληρικά σύλλογος" (1830) appear annually, one of which is a leading serial.
PERIOECI—PERIPATETICS

Sochineniya (1755-1764), or "Monthly Works." In 1759 Sumarokov founded the Trudolyubivaya Pishchali, or "Industrious Bee," giving translations from the Spectator, and, for the first time, critical essays. Karamzin brought out in 1802 the Vvestnik Evropi, an important review with liberal tendencies, and in 1803 appeared The Russkoi Vvestnik (1808) was revived at Moscow in 1856 by Kattkov. The two last named are still published each month. The romantic school was supported by Sin Uchechina (1812), "Son of the Fatherland." The pechati (literary almanac) of the Russian Press grew to a monthly; and came to an end soon after 1839. One of the most successful Russian reviews has been the Biblioteka dlya Tchentia (1834) or "Library of Reading." The Russkaya Missl, "Russian Thought," published in 1837-1874, was a distinguished tutorial periodical starting in literature, and in the Russian literature of the 19th century. Among other Russian reviews may be mentioned the Dnevnik Literatury of Lemberg; the Biblioteka Warszawska (1841), monthly; Przegląd Polski (1844), monthly; Przegląd naukowy i literacki (1872), monthly; Przegląd poszewny (1848), monthly. Kumania commenced with the Magazin ilstorica pentru Dacia (1845), containing valuable historical documents; and Moldavia with Dacia Literaria (1840) and Revista Romulu, which has the Commercio, literară (1848), monthly, and Romanul, revistă literară ilustrată septembrie. The best literary review Servia has had was the Wila, edited by Novakovic.

As to the presentative periodicals of the European type of which the following are representative examples: Fudoku-Gacho (native customs); The Kokka (art); Toyoh-Gakuszę-Zasshi (science); Jogoku-Zasshi (domestic economy); Tetsusagush-Zasshi (philosophy); Keikoku-Zasshi (political economy); Tajo literature.

General Indexes to Periodicals. The latest and in the most complete collection of periodicals in all languages ever brought together is that preserved in the British Museum, and the excerpt from the printed catalogue of the library, entitled Periodical Publications (London, 1879), gives particulars for nearly every review, magazines, and other works issued periodically, with the exception of transactions and proceedings of learned societies and of British and Colonial newspapers later than 1700. The titles of those reviews which number not less than 2,000, are arranged under the town or place of their publication.

The Edinburgh and Quarterly Reviews, the Revue des deux mondes, the Revue historique, Deutsche Rundschau and others issue from time to time general indexes of their contents, while the periodical literature of special departments of study and research are noted in the various Jahresthichte published in Germany, and indexed monthly in such English and American magazines as the Engineering Magazine, Geographical Journal, English Historical Review, American Historical Review, Economic Journal (political economy), Library Journal and Library Association Record (for bibliography) and the Educational Review. The Cat. of Scientific Papers (1800-1900) of the Royal Society (1867-1898), and the Repertorium der de gographie. Complete lists are given by A. B. Kroeger (Guide to British Periodicals, and Serials, 1879-1897) for the German Patent Office, and specimens of indexes of special periodicals. There are also annual indexes such as those in the Zoological Record and Annalen de gographie. Complete lists are given by A. B. Kroeger (Guide to British Periodicals, and Serials, 1879-1897). See also bibliography of Books reviewed in American Periodicals, by G. F. Danforth (1902-1903); Book Review Digest (1906), &c.; H. C. Bolton's Cat. of Scientific and Technical Periodicals (1892); Report of the Committee of the British Association, 1897; Harrison's Int. Cat. of Scientific Lit. (1903-1904); S. H. Alcock's Index to American Serials, 1833-1870 (Cam [Harvard Univ.] 1876); Cat. of Periodicals (English and Foreign) in Bod. Lib., 1878-1880; Bibliothèque Nationale, Liste des périodiques étrangers (1866). A useful select list, including all periodicals, is J. D. Brown's Classified List of American Periodicals (1904).

PERIOECI (περιοηθικοί, those who dwell around, in the neighbourhood) in ancient Laconia the class intermediate between the Spartan citizens and the serfs or helots (νέων). Ephorus says (Strabo viii. 364 seq.) that they were the original Achaeans inhabitants of the country, that for the first generation after the Dorian invasion they shared in the franchise of the invaders, but that this was afterwards taken from them and they were reduced to a subject condition and forced to pay tribute. The term, however, came to denote not a nationality but a political status, and though the main body of the perioeci may have been Achaeans in origin, yet they afterwards included Arcadians on the northern frontier of Laconia, Dorians, especially in Cythera and in Messenia, and Ionians in Cynuria. They inhabited a large number of settlements, varying in size from important towns like Gythium to insignificant hamlets (Isocrates xii. 179); the names of these, so far as they are known, have been collected by Clinton (Fasti helenici, 2nd ed. i. 401 sqq.). They possessed personal freedom and some measure of communal independence, but were apparently under the immediate supervision of Spartan harmons (governors) and subject to the general control of the ephors, though Isocrates is probably going too far in saying (xii. 181) that the ephors might put to death without trial as many of the perioeci as they pleased. Certain it is that they were excluded not merely from all Spartan offices of state, but even from the assembly, that they were absolutely subject to Spartan orders, and that, owing to the presence of case, or the weight of marriage (αξαντηθείς) the right between the two classes was not drawn, and they were also obliged to pay the "royal tribute," perhaps a rent for domestic and military service. This last burden grew heavier as time went on; 5000 Spartiates and 5000 perioeci hoplites fought at Platea in 479 B.C., but the steady decrease in the number of the Spartiates necessitated the increasing employment of the perioeci. Perioeci might serve as petty officers or even rise to divisional commands, especially in the fleet, but seemingly they were never set over Spartiates. Yet except at the beginning of the 4th century the perioeci were, so far as we can judge, fairly contented, and only two of their cities joined the insurgent helots in 404 B.C. (Thuc. i. 101). The reason of this was that, though the land which they cultivated was very unproductive, yet the prohibition which shut out every Spartan from manufacture and commerce left the industry and trade of Laconia entirely in the hands of the perioeci. Unlike the Spartiates they might, and did, possess gold and silver and the iron and steel works from the mines of Mt Tapos, the shoes and woolen stuffs of Amyclae, and the import and export trade of Laconia and Messenia probably enabled some at least of them to live in an easy and comfort unknown to their Spartan lords.

PERIPATETICS (from Gr. περιπατεῖν, to walk about), the name given in antiquity to the followers of Aristotle (q.v.), either from his habit of walking up and down as he lectured to his pupils, or from the περιπατεῖν (covered walk) of the Lyceum. Aristotle's immediate successors,1 Theophrastus and Eudemus of Rhodes, were diligent scholars rather than original thinkers. They made no innovations upon the main doctrines of their master, and their industry is chiefly directed to supplementing his works in minor particulars. Thus they amplified the Aristotelian doctrine of logic but the theory of the hypothetical and disjunctive syllogism, based upon the first figure of the categorical syllogism, the five moods out of which the fourth figure was afterwards constructed. The impulse towards natural science and the systematizing of empirical details which distinguished Aristotle from Plato was shared by Theophrastus (q.v.). The same turn for detail is observable in his ethics, where, to judge from the imperfect evidence of the Characters, he elaborated still farther Aristotle's portraiture of the virtues.

1See Gellius, Noct. Att. xiii. 5, for the story of how Aristotle chose Theophrastus as his successor.
and their relative vicissitudes. In his doctrine of virtue the distinctive Peripatetic position regarding the importance of external goods was defended by him with emphasis against the assaults of the Stoics. He appears to have laid even more stress on this point than Aristotle himself, being doubtless led to do so, partly by the heat of controversy and partly by the importance which leisure and freedom from harassing cares naturally assumed to a man of his studious temperament. The meta-

physicai ἀρχαια of Theophrastus which have come down to us show that he was fully alive to the difficulties that beset many of the Aristotelian definitions. But we are ignorant how he proposed to meet his own criticism; and they do not appear to have suggested to him an actual departure from his master's doctrine, much less any radical transformation of it. In the difficulties which he raises we may perhaps detect a leaning towards a naturalistic interpretation. The tendency of Eudemus, on the other hand, is more towards the theological or Platonic side of Aristotle's philosophy. The 

Eudemus of Rhodes, or, Eudemonian Ethics (which, with the possible exception of the three books common to this treatise and the Nicomachean Ethics, there need be no hesitation in ascribing to Eudemus) expressly identify Aristotle's ultimate ethical ideal of theōría with the knowledge and contemplation of God. And this supplies Eudemus with a standard for the determination of the mean by reason, which Aristotle demanded, but himself left vague. Whatever furthers us in our progress towards a knowledge of God is good; every hindrance is evil. The same spirit may be traced in the author of the chapters which appear as an appendix to book i. of Aristotle's Metaphysics. They have been attributed to Paicles, the nephew of Eudemus. For the rest, Eudemus shows even less philosophical independence than Theophrastus. Among the Peripatetics of the first generation who had been personal disciples of Aristotle, the other chief names are those of Aristocles (q.v.), of Tarentum (q.v.), and Diogenes (q.v.) of Messene. Aristotle, who had formerly belonged to the Pythagorean school, maintained the position, already combatted by Plato in the Phaedo, that the soul is to be regarded as nothing more than the harmony of the body. Diacearchus agreed with his friend in this naturalistic rendering of the Aristotelian entelechy, and is recorded to have argued formally against the immortality of the soul.

The naturalistic tendency of the school reached its full expression in Strato of Lampsacus, the most independent, and probably the ablest, of the earlier Peripatetics. His system is based upon the formal denial of a transcendent deity. Cicero attributes to him the saying that he did not require the aid of the gods in the construction of the universe; in other words, he reduced the formation of the world to the operation of natural forces. We have evidence that he did not substitute an immanent world-soul for Aristotle's extra-mundane deity; he recognized nothing beyond natural necessity. He was at issue, however, with the atomistic materialism of Democritus in regard to its twin assumptions of absolute atoms and infinite space. His own speculations led him rather to lay stress on the qualitative aspect of the world. The true explanation of things was to be found, according to Strato, in the forces which produced their attributes, and he followed Aristotle in deducing all phenomena from the fundamental attributes or elements of heat and cold. His psychological doctrine explained all the functions of the soul as modes of motion, and denied any separation of the reason from the faculties of sense-perception. He appealed in this connexion to the statement of Aristotle that we are unable to think without a sense-image.

The successors of Strato in the headship of the Lyceum were Lyco, Arius of Ceos, Critoalas (q.v.), Diodorus of Tyre, and Errynus, who brings the philosophic succession down to about 100 B.C. Other Peripatetics belonging to this period are Hiero-

nymphus of Rhodes, Prytanis and Phormio of Ephesus, the delitus senex who attempted to instruct Hannibal in the art of war (Cic. De orat. ii. 18). Sotion, Hermippus and Satyrus were historians rather than philosophers. Heraclides Lembus, Agatharchides and Antisthenes of Rhodes are names to us and nothing more. The fact is that, after Strato, the Peripatetic school has no thinker of any note for about 200 years.

Early in the 1st century B.C. all the philosophic schools began to be invaded by a spirit of eclecticism. This was partly due to the influence of the practical Roman spirit. This influence is illustrated by the proconsul Lucius Gellius Publicola (about 70 B.C.), who proposed to the representatives of the schools in Athens that he should help them to settle their differences (Cic. De leg. 1. 20). This atmosphere of indifference imperceptibly influenced the attitude of the contending schools to one another, and we find various movements towards unity in the views of Boethus the Stoic, Panaeitus and Antiochus of Ascalon, founder of the so-called "Fifth Academy." Meanwhile the Peripatetic school may be said to have taken a new departure and a new lease of life. The impulse was due to Andronicus of Rhodes. His critical edition of Aristotle indicated to the later Peripatetics the direction in which they could profitably work, and the school devoted itself henceforth almost exclusively to the writing of commentaries on Aristotle, e.g. those of Boethus of Sidon, Aristot of Alexandria, Staseas, Cratippus, and Nicolaus of Damascus. The most interesting Peripatetic work of the period is the treatise De mundo, which is a good example within the Peripatetic school of the eclectic tendency which was then in the air. The admixture of Stoic elements is so great that some critics have attributed the work to a, Stoic author; but the writer's Peripateticism seems to be the more fundamental constituent of his doctrine.

Our knowledge of the Peripatetic school during the first two centuries of the Christian era is very fragmentary; but those of its representatives of whom anything is known confined themselves entirely to commenting upon the different treatises of Aristotle. Thus Alexander of Aueg, the teacher of Nero, commented on the Categories and the De caelo. In the 2nd century Aspasius (q.v.) and Adrastus of Aphrodisian wrote numerous commentaries. The latter also treated of the order of the Aristotelian writings in a separate work. Somewhat later, Herminus, Achaicus and Sosigens commented on the logical treatises. Aristocles of Messene, the teacher of Alexander of Aphrodisias, was the author of a complete critical history of Greek philosophy. This second phase of the activity of the school closes with the comprehensive labours of Alexander of Aphrodisias (Scholarchi, c. 200), the exegete par excellence, called sometimes the second Aristotle. Alexander's interpretation proceeds throughout upon the naturalistic lines which have already become familiar to us. Aristotle had maintained that the individual soul alone is real, and had nevertheless asserted that the universal is the proper object of knowledge. Alexander seeks to reconcile this by holding to the first position alone. The individual is prior to the universal, he says, not only "for us," but also in itself, and universals are abstractions which have merely a subjective existence in the intelligence which abstracts them. Even the deity must be brought under the conception of individual substance. Such an interpretation enables us to understand how it was possible, at a later date, for Aristotle to be regarded as the father of Nominalism. Form, Alexander proceeds, is everywhere indivisible from matter. Hence the soul is inseparable from the body whose soul or form it is. Reason or intellect is bound up with the other faculties. Alexander's commentaries formed the foundation of the Arabic and Scholastic history of Aristotle. Soon after Alexander's death the Peripatetic school was merged, like all others, in Ne-

platonism (q.v.).

PERIPATUS, a genus of animals belonging to the air-breathing division of the phylum Arthropoda. It differs, however, from all other Arthropoda in such important respects that a special class, equivalent in rank to the old-established Arthropod classes, had been created for its sole occupancy. This class has been named the Prototrichaeca or Oynychophora (see ARTHROPODA), and may be most appropriately placed in the system in the
neighbourhood of the Myriapoda, though it must not be forgotten that it differs from the Myriapoda more than the Myriapoda differ from other Arthropoda, and that in some respects it presents features which recall the segmented worms (Annelida).

The genus has a wide distribution (see below), but it has not been found in Europe or in North America. There is but little variety of structure in the genus, and the species are limited in number. They live beneath the bark of trees, in the crevices of rock and of rotten stumps of trees, and beneath stones. They require a moist atmosphere, and are exceedingly susceptible to drought. They avoid light, and are therefore rarely seen. They move slowly, picking their course by means of their antennae. When irritated they eject with considerable force the contents of their slime reservoirs by means of the sudden contraction of the muscular body-wall. The slime, which appears to be harmless, is extremely sticky, but it easily comes away from the skin of the animal itself. Locomotion is effected by means of the legs, with the body fully extended. Hutton describes his specimens as sucking the juices of flies, which they had stuck down with their slime, and they have been observed in captivity to devour the entrails which have been removed from their fellows, and to eat raw sheep's liver. They move their mouths in a suctorial manner, tearing the food with their jaws. They have the power of extruding their jaws from the mouth, and of working them alternately backwards and forwards. They are viviparous; the young are fully formed at birth, and differ from the adult only in size and colour. The mother does not appear to pay any special attention to her offspring, which wander away and get their own living. It has lately been stated that some of the Australian species are normally oviparous, but this has not been fully proved. Sexual differences are not strongly marked, and are sometimes absent. There does not appear to be any true copulation. In some species the male deposits small oval spermatophores indiscriminately on any part of the body of the female. It seems probable that in such cases the spermatophore makes its way from the adherent spermatophore through the body-wall into the body, and so by traversing the tissues reach the ovary. In other species which possess receptacula seminis it is probable that fertilization is effected once only in early life before any ova pass into the uterus.

External Features.—The anterior part of the body may be called the head, though it is not sharply marked off from the rest of the body (fig. 1). The head carries three pairs of appendages, a pair of simple eyes, and a ventrally placed mouth. The body is elongated and vermiliform; it bears a number of paired appendages, each terminating in a pair of claws, and all very much alike. The number varies in the different species. The anus is always at the posterior end of the body, and the generative opening is on the ventral surface, just in front of the anus; it may be between the legs of the penultimate pair, or between the legs of the last pair, or it may be subterminal. The colour varies considerably in the different species, and even in different individuals of the same species. The skin has a velvety appearance, and is thrown into a number of transverse ridges, along which wart-like papillae are placed. These papillae, which are found everywhere, are the primary papillae; they are covered with small, scale-like projections called secondary papillae, and are specially developed on the dorsal surface, less so on the ventral. Each papilla carries at its extremity a well-marked spine. Among the primary papillae smaller accessory papillae are sometimes present. The appendages of the head are the antennae, the jaws and the oral papillae. The mouth is at the hinder end of a depression called the buccal cavity, and is surrounded by an annular tumid lip, raised into papilliform ridges and bearing a few spines (fig. 2). Within the buccal cavity are the two jaws. They are short, stump-like, muscular structures, armed at their free extremities by a pair of cutting blades or claws, and are placed one on each side of the mouth. In the median line of the buccal cavity in front is placed a thick muscular protuberance, which may be called the tongue, though attached to the dorsal instead of to the ventral wall of the mouth (fig. 2). The tongue bears a row of small, chitinous teeth. The jaw-claws (figs. 3 and 4), which resemble in essential points the claws borne by the feet, and, like these, are thickenings of the cuticle, are sickle-shaped. They have their convex edge directed forwards, and their concave, or cutting edge, turned backwards. The inner cutting plate (fig. 3) usually bears a number of smaller teeth. The oral papillae are placed at the sides of the head (fig. 2). The ducts of the slime-glands open to their free end. They possess two main rings of projecting tissue, and their extremities papillae are arranged in flocks. The ambulatory appendages vary in number. There are seventeen pairs in P. capensis and eighteen in P. balfouri, while in P. jamais- censis the number varies from twenty-nine to forty-three. They consist of two main divisions, which we may call the leg and the foot (fig. 5). The leg (l) has the form of a truncated cone, the broad end of which is attached to

![Peripatus](https://example.com/peripatus.jpg)

**Fig. 1.** — *Peripatus capensis*, drawn from life. Life size.

The ventral-lateral wall of the body, of which it is a prolongation. It is marked by a number of rings of papillae placed transversely to its long axis, the dorsal of which are pigmented like the dorsal surface of the body, and the ventral like the ventral surface. At the narrow distal end of the leg there are on the ventral surface three or four (rarely five) spiniferous pads, each of which is continued dorsally into a row of papillae. The foot is attached to the distal end of the leg. It is slightly narrower at its attached extremity than at its free end. It bears two sickle-shaped claws, and at its distal end three (rarely four) papillae. The part of the leg below the claws is especially retractile, and is generally found more or less telescoped into the proximal part. The legs of the fourth and fifth pairs differ from the others in that the third pad (counting from the base) is partially distally placed very near the end of the leg carries the opening of the enlarged nephridia of these segments. In some species certain of the legs bear on their ventral sides furrows with tumid lips called secondary papillae, and are especially developed on the dorsal surface, less so on the ventral. Each papilla carries at its extremity a well-marked spine. Among the primary papillae smaller accessory papillae are sometimes present. The appendages of the head are the antennae, the jaws and the oral papillae. The mouth is at the hinder end of a depression
BREEDING.—As already stated, Peripatus is viviparous. The Australasian species come nearest to laying eggs, inasmuch as the eggs are large, full of yolk, and enclosed in a shell; but development normally takes place in the uterus, though abnormally, incompletely developed eggs are extruded. The uterus always contains a young, which are usually at different stages of development and are born at different times of the year. In most of the African species, however, the embryos of the uterus are almost of the same age and are born at a definite season. The young of P. peronatus are born in April and May. They are almost colourless at birth, excepting the antennae, which are green, and their length is 10 to 15 mm. A large female will produce thirty to forty young in one year. The period of gestation is thirteen months, that is, the ova pass into the oviducts about one month before the young of the preceding year are born.

ANATOMY.—The alimentary canal (fig. 6). The buccal cavity, as explained above, is a secondary formation around the true mouth, which is at its dorsal posterior end. It contains the tongue and the jaws, which have already been described, and into the hind end of it there open ventrally by a median opening the salivary glands. The mouth leads into a muscular pharynx, which is connected by a short oesophagus with the stomach. The stomach forms by far the largest part of the alimentary canal. It is a dilated soft-walled tube, and leads behind into the short narrow rectum, which opens at the anus. There are no glands opening into the alimentary canal. The central nervous system, the anterior part of which is shown in fig. 7, is of the 'rope-ladder' type, and the ventral cords meet over the rectum. The cuticle is a thin layer, of which the spines, jaws and claws are special developments. The surface is not, however, smooth, but is everywhere, with the exception of the perioral region, raised into minute secondary papillae, which in most instances bear at their free extremity a somewhat prominent spine. The epidermis, placed immediately within the cuticle, is composed of a single row of cells. The pigment which gives the characteristic colour to the skin is deposited in the protoplasm of the outer ends of the cells in the form of small granules. Beneath the epidermis is a thin cutis, which is followed by the muscular layers (external circular and internal longitudinal). The muscular fibres of the jaws are transversely striated, those of the oesophagus are incompletely striated, and those of the rectum are not striated. The cuticle is resting upon a musculofibrillar layer, which is divisible into a true musculature and a true epidermis, the latter composed of a single layer of cells. The periclude (fig. 8) are formed of epithelial cells, bounded towards the lumen of the pit by a very delicate cuticular membrane continuous with the cuticle covering the surface of the body. Internally it expands in the transverse plane, and from the expanded portion the tracheal tubes arise in diverging bundles. The tracheae are minute tubes exhibiting a faint transverse striation which is probably the indication of a spiral fibre. They appear to branch, but not exceptionally. The tracheal apertures are diffused over the surface of the body, but are especially developed in certain regions. The vascular system consists of a dorsal tubular heart with paired ostia leading into it from the pericardium, of the pericardium, and the various other divisions of the pericardial cavity (fig. 12, D). As in all Arthropoda, the pericardial cavity is a haemocoele, i.e. contains blood, and forms part of the vascular system. It is divided by septa into chambers (fig. 12, D), of which the most important are the central chamber containing the alimentary canal and the dorsal chamber or pericardium. Nephridia are present in all the legs. In all of them (except the first three) the following parts may be recognized (fig. 9): (1) a vesicular portion...
PERIPATUS

The development has been worked out in P. capensis, to which species the following description refers. The segmentation is peculiar, and leads to the formation of a solid gastrula, consisting of a cortex of ectoderm nuclei surrounding a central endodermal mass, which is exposed at one point—the blastopore. The enteron arises as a space in the endoderm, and an opacity—the primitive streak—appears at the hind end of the blastopore (fig. 11, B). The elongation of the embryo is accompanied by an elongation of the blastopore, which soon becomes dumb-bell shaped (fig. 11, C). At the same time the mesoblastic somites (embryonic segments of mesoderm) make their appearance in pairs at the hind end, and gradually travel forwards on each side of the blastopore to the front end, where the somites of the anterior pair soon meet in front of the blastopore (fig. 11, D). While the middle part of the blastopore has closed by a fusion of its lips, so that the blastopore is represented by two openings, the future mouth and anus. A primitive groove makes its appearance behind the blastopore (fig. 11, D). At this stage the hind end of the body becomes curved ventrally into a spiral (fig. 11, E), and at the same time the appendages appear as hollow processes of the body-wall, a mesoblastic somite being prolonged into each of them. The first to appear are the antennae, into which the praeoral somites are prolonged. The appendages appear in regular order, viz. jaw, oral papillae, legs 1-17. The full number of somites and their appendages is not, however, completed until a later stage. The nervous system is formed as an annular thickening of ectoderm passing in front of the mouth and behind the anus, and running on each side of the blastopore along the lines of the somites. The praeoral part of this thickening, which gives rise to the cerebral ganglia, becomes pitted inwards on each side (fig. 11, F, c.g.). There are five even to nine somites, and an additional ventral appendage of the suprapharyngeal ganglia of the adult (fig. 7, d). The lips are formed as folds of the side wall of the body, extending from the praeoral lobes to just behind the jaw (fig. 11, F, L). They enclose the jaws (j), mouth (M), and opening of the salivary glands (o.s.), and so give rise to the buccal cavity. The embryo has now lost its spiral curvature, and becomes completely doubled upon itself, the hind end being in contact with the mouth (fig. 11, G). It remains in this position until birth. The jaws are now even to ten mm. in length, and have at all generative stages, but the rest of the body is either quite white or of a reddish colour. This produces the curve of the adult, is the supposed glandular system and the adult in being soluble in spirit. The mesoblastic somites are paired sacs formed from the anterior lateral portions of the primitive streak (fig. 11, C). As they are formed they become placed in pairs on each side of the blastopore. The somites of the first pair eventually obtain an opening in the neural groove and appear from it. Each of the ventral parts acquires an opening to the exterior, just outside the nerve-cord,
and becomes entirely transformed into a nephridium (fig. 12, D, 2'). The dorsal part shifts dorsally and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somite it dwindles and disappears, but in the posterior part it unites with the dorsal somites of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connexion with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears: the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the pericentral cavity develop as a series of spaces between the ectoderm and endoderm, and later in the mesoderm. The mesoderm seems to be formed entirely from the proliferation of the cells of the mesoblastic somites. It thus appears that in *Peripatus* the coelom does not develop a perivisceral portion, but gives rise only to the renal and reproductive organs.

The genus *Peripatus* was established in 1826 by L. Guilding, who first obtained specimens of it from St Vincent in the Antilles. He regarded it as a mollusc, being no doubt deceived by the slug-like appearance given by the antennae. Specimens were subsequently obtained from other parts of the neotropical region, and from South Africa and Australia, and the animal was variously assigned by the zoologists of the day to the Annelida and Myriapoda. Its true place in the system, as a primitive member of the group Arthropoda, was first established in 1874 by H. N. Moseley, who discovered the trachea. *Peripatus* is an Arthropod, as shown by (1) the presence of appendages modified as jaws; (2) the presence of paired lateral ostia perforating the wall of heart and putting its cavity in communication with the pericardium; (3) the presence of a vascular body cavity and pericardium (haemocoelic body cavity); (4) absence of a perivisceral section of the coelom. Finally, the tracheae, though not characteristic of all the classes of the Arthropoda, are found nowhere outside that group, and constitute a very important additional reason for uniting *Peripatus* with it. *Peripatus*, though indubitably an Arthropod, differs in such important respects from all the other established Arthopod classes, that a special class, equivalent in rank to the others, and called Protostomata or Onychophora, has, as we have seen, to be created for its sole occupancy. This unlikeness to other Arthropoda is mainly due to the Annelidan affinities which it presents, but in part to the presence of the following peculiar features: (1) the number and diffusion of the tracheal apertures; (2) the restriction of the jaws to a single pair; (3) the disposition of the generative organs; (4) the texture of the skin; and (5) the simplicity and similarity of all the segments of the body behind the head. The Annelidan affinities are superficially indicated in so marked a manner by the thinness of the cuticle, the dermo-muscular body-wall, the hollow appendages, that, as already stated, many of the earlier zoologists who examined *Peripatus* placed it among the segmented worms; and the discovery that there is some solid morphological basis for the determination constitutes one of the most interesting and striking facts in recent work on the genus. The Annelidan features are (1) the paired nephridia in every segment of the body behind the first two (Saenger, Balfour); (2) the presence of cilia in the generative tracts (Gaffron). It is true that neither of these features is absolutely distinctive of the Annelida, but when taken in conjunction with the Annelidan disposition of the chief systems of organs, viz. the central nervous system, and the main vascular trunk or heart, they may be considered as indicating affinities in that direction.

### Synopsis of Species.

**Peripatus** (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of oral papillae, and a varying number of claw-bearing ambulatory legs. Dorsal surface arched and more deeply pigmented than the flat ventral surface. Skin transversely ridged and beset by wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of lateral abdominal vessels and small lateral hollow appendages; ventral cords widely divericatad, without distinct ganglia. Alimentary canal simple, uniciliated. Segmentally arranged paired nephridia are present. Nephridial bladder is in the same cavity as the body cavity, and there is no nephridial duct in the cloaca. The nephridial orifice does not communicate with the paired nephridia. Heart tubular, with paired ostia. Respiration by means of tracheae. Dioecious; males smaller and generally less variable than the females; females typically two-segmented, with the genital tubes continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula and in Sumatra?.

The genus *Peripatus*, so far as adult conformation is concerned, is a very homogeneous one. It is true, as was pointed out by Sedgwick, that the species, even in the same part of the world resemble one another more closely than they do species from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certain that one does not desire to divide them into generic or subgeneric groups, as has been done by some zoologists. (The following genera have been proposed: *Peripatus* for the neotropical species, *Periptedoides* for the Australasian, *Peripatopsis* and *Opisthopatus* for the *Peripatoides*, *Porperipatus* for the New Britain, *Eopetopatus* for the Australian, *Paraperipatus* for the New Britain, *Eopetopatus* for the Mexican species, and *Oopetopatus* for the supposed ovoiparous species of Australia and New Zealand.)

The colour is highly variable in all species from all regions, it is perhaps more constant in the species from the neotropical region. The legs, the position of the generative tracts, the presence of a receptaculum seminis and a receptaculum ovoorum, the arrangement of the primary papillae on the distal end of the feet, and above all the early development.

**South African Species.**—With three spinous pads on the legs,
and feet with two primary papillae on the anterior side and one on the posterior side; outer jaw with one minor tooth at the base of the main tooth, inner jaw with no interval between the large teeth and the series of small ones; last fully developed leg of the male has in its anterior surface a gland-like organ, the duct of which runs on its ventral surface; coxal organs absent; the nephridial openings of the 4th and 5th pairs of legs are placed in the proximal spinaud pad. Genital opening subterminal, behind the last pair of forefeet. Oviducts and receptaculum seminis from about one quarter to one third the length of the body. Ova of considerable size, but with only a small quantity of yolk. The embryos in the uterus are all nearly of the same age, except for a month or two before birth, when two broods overlap.

The following species are aberrant in respect of these characters: *Peripatus* (Opisthopatus) *cinetines*, Perroll (Cape Colony and Natal), presents a beautiful view of the species. On each ovipositor, some of the legs are provided with well-developed coxal organs, the feet have one anterior, one posterior and one dorsal papilla, and the successive difference in the ages of the embryos in the uterus, though nothing like that found in the neotropical species, is slightly greater than that found in the investigated African species. Several pairs of legs in the middle region of the body are provided with enlarged cranial glands which open on a large papilla. Male with four accessory glands, opening on each side of and behind the genital aperture. *P. tholoni*, Bovier, (Equatorial West Africa [Gaboon]), shows some neotropical features; there are 24 to 25 pairs of legs, the genital opening is between the penultimate and ultimate legs, and the last two pairs of legs have a coxal organ present. The nephridial openings of the 4th and 5th legs are proximal to the 3rd leg, coxal organs are present, and the jaws are of the neotropical type; the oviducts have receptacula seminis. The following South American species may be observed with 17 (rarely 18) pairs of claw-bearing legs; *P. balfouri* (Sedgw.) with 18 (rarely 19) pairs; *P. moleyati* (Wood-M.,) with 20 to 24 pairs.

Australasian Species.—With 14, 15 or 16 pairs of claw-bearing ambulatory legs, with three spinous pads on the legs, and nephridial opening of the 4th and 5th legs on the proximal pad; feet with one anterior, one posterior and one dorsal primary papilla; inner jaw with hook-shaped, with one minor tooth at the base of the dentition. The male with or without a large white papilla on its ventral surface for the opening of a gland, and marked papillae for the cranial glands are sometimes present on other legs of the male; some species have the mouthparts armed with teeth, the venous system is similar to that of the Malayan species. The genital aperture is between the legs of the last pair; oviducts with receptacula seminis, without receptaculum seminum; the terminal portion of the vesicula deferens long and complicated; the accessory male glands open between the genital aperture and the anus, near the latter. Ova large and heavily charged with yolk, and provided with a stout shell. The uterus appears to contain embryos of different ages. Specimens are recorded from West Australia, Queensland, New South Wales, Victoria and New Zealand.

Neotropical Species.—With three to five spinous pads on the legs, nephridial opening of the 4th and 5th legs usually proximal to the 5th leg; feet with one anterior and one posterior, or two on the anterior side and one on the posterior, or with two on the anterior and two on the posterior; outer jaw with small minor tooth and teeth at the base of the main tooth, inner jaw with diastema. A variable number of legs have a genital opening with one or two large papillae carrying the openings of the cranial glands; well-developed coxal organs present on most of the legs. The primary papillae usually divided into two series, the smaller one situated on the inner side of the leg; the oviducts provided with receptacula seminis and ovum; unpaired part of vas deferens long and complicated; accessory organs of male opening at the sides of the anus. Ova minute, with a thin shell. The number of legs usually not always variable in the same species; the usual number is 28 to 32 pairs, but in some species 40 to 43 pairs are found. The neotropical species appear to be limited to South America, South Africa, and the islands of the Andes, which inhabit the high plateau or Pacific slope of the Andes; in these there are 4 (sometimes 5) pedal papillae, and the nephridial openings of the 4th and 5th legs are on the third pad; and (2) the Carabean species, viz., the remaining neotropical species, there are 3 papillae on the foot and the nephridial openings of the 4th and 5th legs are between the 3rd and 4th pads. The Andean species are *P. eisenii* (Wh.), *P. tuberculatus* (Bouv.), *P. lankesteri* (Bouv.), *P. quenstieni* (Schm.), *P. crocodili* (Cam.), *P. cameronii* (Bouv.) and *P. balsi* (Cam.). Of the remaining species, which only inhabit the Island of New Zealand, viz., *P. jamaisensis* (Gr. and Cock), *P. trinidadiensis* (Sedgw.), *P. forjanum* (Kern.), *P. philenii* (Schl.).
PERIPTERAL (Gr. περιπτερα, round, and περιφορα, a wing), in architecture, the term applied to a temple or other structure where the columns of the front portion are returned along its sides as wings at the distance of one or two intercolumniations from the walls of the naos or cela. Almost all the Greek temples were peripteral, whether Doric, Ionic, or Corinthian (see TEMPLE).

PERISSODACTyla (i.e. odd-toed), the name proposed by Sir R. Owen for that division of ungulate mammals in which the toe corresponding to the middle (third) digit of the human hand and foot is symmetrical in itself, and larger than those on either side (when such are present). The Perissodactyla have been brigaded with the Artiodactyla (q.v.) to form the typical group of the ungulates, under the name of Diplarthra, or Ungulata Vera, and the features distinguishing the combined group from the less specialized members of the order Ungulata will be found under the heading of that order.

The following are the leading characteristics by means of which the sub-order Perissodactyla is distinguished from the Artiodactyla. The cheek-teeth (premolars and molars) form a continuous series, with quadrature, transversely ridged or complex crowns—the posterior premolars usually resembling the molars in structure. Crown of the last lower molar commonly bilobed. Dorsal-lumbar vertebrae never fewer than twenty-two, usually twenty-three in the existing species. Nasal bones expanded posteriorly. An alisphenoid canal. Femur with a third trochanter. The middle or third digit on both fore and hind feet larger than any of the others, and symmetrical in itself, the free border of the terminal phalanx being evenly rounded (see fig. 1). This may be the only functional toe, or the second and fourth may be subequably developed on each side. In the tarsi and many extinct forms the fifth toe also remains on the fore-limb, but its presence does not interfere with the symmetrical arrangement of the remainder of the foot on each side of the median line of the third or middle digit. The astragulus has a pulley-like surface above for articulation into the tibia, but its lower surface is flattened and unites to a much greater extent with the navicular than with the cuboid, which bone is of comparatively less importance than in the Artiodactyls. In existing forms the calcaneum does not articulate with the lower end of the fibula. The stomach is simple, the caecum large and capacious, the placenta diffused, and the teats inguinal.

The Perissodactyla may be divided into the four following sections, namely the extinct Titanotheridea, the Hippoidea, represented by the horse tribe and their ancestors, the Tapiridea, typified by the tapirs, and the Rhinocerotoidea, which includes the modern rhinoceroses and their forerunners.

1. Titanotheria.—In the Titanotheridea the dentition may be expressed by the formula \( \text{C}, 3; \text{P} \times 4, 1; \text{M} \times 3, 3 \). There is usually a short gap between the canine and first premolar; the upper molars are short-crowned and transitional between the bunodont (tubercular) and selodont (crenate) types, with two outer concave tubercles and two inner conical ones; while the lower molars are crescentic, with three lobes in the last of the series. The skull is elongated, with the orbit not separated from the temporal fossa and the nasals, which may or may not carry horns, or horn bases, as in Paraceratherium (see PALAEOERTHEA). The post-glenoid, post-typanic and paroccipital processes of the skull are large, and there is an alisphenoid canal. There are four functional toes in front and three behind; while the calcaneum, usually divided in the front, is divided on the fifth (i.e. innermost) side of the fibula. The group is represented by the families Palaeotheriidae and Titanotheriidae in the Tertiary deposits of North America. Both families are described under the heading TITANOTHERIA.

2. Horse Group.—In the Hippoidea there is generally the full series of 44 teeth, but the first premolar, which is always small, is often deciduous or even absent in the lower or in both jaws. The incisors are chisel-shaped, and the canines tend to become reduced, so as in the more primitive species to occupy a more or less midway position in a longer or shorter gap between the incisors and premolars. In the upper molars the two outer columns or tubercles of the primitive tubercular molar coalesce to form a crest, which in some cases proceeds two crescentic transverse ridges. The connexion between the crests and the wall being slight or imperfect, and the crests themselves sometimes tubercular. Each of the lower molars carries two crescentic ridges. In the earlier forms the cheek-teeth are low-crowned, but in the higher types they are high-crowned; the number of front teeth in the latter varies from four to one, and of hind ones from three to one. The post-glenoid, post-typanic and paroccipital processes of the skull are large; the second of these being always distinct. Nasals long, normally without traces of horns.

The section is divisible into the families Equidae and Palaeoertoidea, of which the latter is extinct.

In the Equidae the premolars are generally \( 4 \) or \( 3 \). In the earlier short-crowned forms these teeth are unlike the molars, and the first of the series is separated by a gap from the second. In the high-crowned types, as well as in some of the intermediate ones, they become molar-like, and roots are not developed in the whole cheek-fractions. The number of the innermost premolars is generally divisible by three; and the ridges of lower cheek-teeth terminating in large loops. Front toes 4, 3 or 1, hind; 3 or 1. (See Equidae and Horse.)

In the Palaeotheriidae the premolars may be \( 5 \) or \( 4 \), and are generally molar-like, while the first (when present) moves closer to the second; all the cheek-teeth short-crowned and rooted, with or without cement. Outer walls of upper cheek-teeth W-shaped, and transverse crests oblique. Orbit open behind; and ridges of lower cheek-teeth generally terminating in small loops. Feet always 3-toed. (See Palaeotherium.)

3. Tapir Group.—In the Tapiridea the dentition may be either the full 44, or lack the first premolar in the lower or in both jaws. The incisors are chisel-shaped, and (unlike the earlier Hippoidea) either the premolars are not developed, or the first premolar is high-crowned. The number of front teeth in the latter varies from four to one, and of hind ones from three to one. The post-glenoid, post-typanic and paroccipital processes of the skull are large; the second of these being always distinct. Nasals long in early, but shorter in later forms, hornless; orbit open behind. Front toes 4, 3 or 1, hind.

This group is also divided into two families, the Tapiridae and Lophiodontidae, the latter extinct.

In the Tapiridae the dentition may be reduced below the typical 44, but never below \( 4 \) Harmony of the premolars is either simple or molar-like. Outer columns of upper molars similar, the hinder ones not flattened; ridges of lower molars oblique or directly transverse, a third ridge to the last molar in the earlier forms. The Lophiodontidae, which date from the Eocene, come in a high-crowned horse-like type of Lophiodon, in which the horse-like characters are more definitely marked by the authority of American palaeontologists that the division of these early forms into equoids and tapiroids is attempted. In North America the earliest representative of the group is Systemodon of the Eocene, a type of enigmatic and unpalatable animal, which is quite simple; while the molars are of a type which would readily develop into that of the modern tapir, both outer columns being conical and of equal size. The absence of a gap between the canine and first premolar, and the lower molar, is regarded as an essentially tapir-like feature. Lophiodoncorchoes apparently represents this stage in the European Lower Eocene; 1sectolophus, of the American Middle Eocene, represents a distinct second species from the Upper Eocene is still more advanced; while the third lobe is, however, retained in the last lower molar. In the
Oligocene of both hemispheres appears Protoceras, which ranges well into the Miocene, and is essentially a tapir, having lost the third lobe of the last lower molar, and being in process of acquiring molar-like upper premolars, although none of these teeth have two cusps. Finally, there are three upper premolars, makes its appearance in the Upper Miocene, and continues till the present day. The characters of the genus may be expressed as follows in a more detailed manner.

The incisors are not, as in Protoceras, some upper incisors the first and second are nearly equal, with short, broad crowns, the third is large and conical, considerably larger than the canine, which is separated from it by an interval. Lower incisors diminishing in size from the first to the last; the whole group, is associated with the third incisor, large and conical, working against (and behind) the canine-like third upper incisor. In both jaws there is a long space between the canines and the commencement of the teeth. The cheek teeth, which are quite delicate in structure, is a premolar with a triangular crown narrow in front owing to the absence of the anterior inner column. The other upper premolars and molars all forced on the same plan and of nearly the same size, with four roots and quadrants, in the same manner, wider transversely than from before backwards, each having four columns, connected by a pair of transverse ridges anterior and posterior. The first lower premolar compressed in front; the others composed of a single pair of transverse crests, with a small anterior and posterior basal ridge. Skull elevated and compressed; with the orbit and temporal fossa widely continuous, there being no true post-orbital process from the frontal bone. Nasal apertures very large, and extending high above the orbits, the outer surface of the latter is concave; the nasal is fused to the frontal bone. Nasals. The inferior maxillae are very large, resembling those of the right or left a large rhinoceros. The inferior maxillae is essentially the lophodont type of Lophiodon, but the last two upper premolars have become molar-like. Finally, in the Oligocene Colodon the last three upper premolars are like the molars, and the first pair of lower premolars is lost. In Europe the group is represented by the long-known and typical genus Lophiodon with three premolars in each jaw, of which the upper are simpler than the molars. The species is especially characteristic of the Miocene and Pliocene, and some of the species attained the size of a rhinoceros.

4. Rhinoceros Group.—The last section of the Perissodactyla is that of the Rhinocerotoidea, represented by the modern rhinoceroses and their extinct allies. In this group the incisors and canines are very short, the number of the upper incisors is reduced, separated by only a short gap from the outer incisor (when present), but by a long one from the first premolar, which is in contact with the second. The second and third premolars, which are always present, are usually of the lophodont type. All the lower molars are essentially the lophodont type of Lophiodon, but the last upper molar assumes a more or less triangular form, with an oblique outer wall, and there are certain complications in the structure of all three. The incisors, although molar-like, may be either short or long, and usually two or more in number. The anterior incisors have, unlike those of the Tapiridae, crescentic ridges, which have not the loops at their extremities characteristic of the advanced Hipparion; the lower lower molar has no third lobe. The facial process of the maxilla is always open; and the premaxillae tend to be reduced and fused with the nasals. Front toes, 3 or 4; hind toes, 3.

The most primitive group is that of the American Hylodontidae, represented by the family Hylodonte, in which the incisors are long and slender, and the incisors are large and small. The upper molar have a cusp and a crook (fig. 2). The skull is high, with the facial and cranial portions approximately equal. There are only three front toes, and the limbs are long and adapted for running.

In the Amynodontidae, represented by the North American Middle Eocene Amynodon and Metamyodon, the premolars may be either 4 or 5, making the total number of teeth either 44 or 40. The incisors tend to become lateral, the canines are elongated, and the last upper molar is sub-quadrangular. The upper molars have a cusp but no crook (fig. 2). As in the last family, the post-glenoid process of the skull is broad; the upper limb being depressed with a shortened facial portion. The fore-foot is five-toed and spreading; indicating that the members of the family were swamp-dwelling animals.

Finally, there is the family Rhinocerotidae, which includes the existing representatives of the group. In this family the dentition has undergone considerable reduction, and may be represented inclusive of all the variations, by the formula i 1 m 2 l 2 m 1 l 2 m 2 3 m 3. The first upper incisor, when present, has an antero-posteriorly elongated crown, but the second is small; when fully developed, the lower canine is a large forwardly directed tusk-like tooth with sharp cutting-edges, and biting against the first upper incisor. The third upper molar is triangular, and most of the teeth of the upper check-series have both crook and cusps. The post-glenoid process is small, and the facial and cranial portions of the skull are approximately equal length. Usually there are three, but occasionally four front toes; and the limb-bones are short.

The number of representatives of the group are known from the Old World. The dentition is undifferentiated in the later ones in the development of dermal horns over the nasal bones, either in laterally placed pairs as in some of the early forms, or in a single line, as in the type, or it may even be absent. The horns of Lophiodon became extinct before the close of the Pliocene period; but in the Old World, although their geographical distribution has become greatly restricted, at least five well-marked species survive. The ancestors of the family were四个自信.

As regards the dentition of the existing species, the check-series consists of the four premolars and three molars above and below, all in contact and closely resembling each other, except the first, which is much smaller than the rest and often deciduous; the

FIG. 2.—Grinding Surface of moderately worn Right Upper Second Molars of Rhinoceroses.

PERISTYLE—PERITONITIS

Limbs stout, and of moderate length. Three completely developed toes, with distinct broad rounded hoofs on each foot. Teats two, inguinal. Eyes small. Ears of moderate size, oval, erect, prominent, placed near the occiput. Skin very thin, in many species thrown into a more or less conical mass by the inward pressure of the median horns on the face. When one is present it is situated over the conjoined nasal bones; when two, the hinder one is over the frontals. These horns, which are of a more or less conical form and usually recurved, and often grow to a great length (through the pressure is sometimes massive enough to cause epidermic cells growing from a cluster of long dermal papillae. The cells formed on each papilla constitute a distinct horny fibre, like a thick hair, and the whole is cemented together by an intermedium substance, and through interspaces between the papillae. It results from this that the horn has the appearance of a mass of aggregated hairs, which, in the newly growing part at the base, readily fray out on destruction of the softer intermediate substance; but as the horn grows, it takes on the appearance of a free papilla of the derm, and not within a follicular involution of the same. Considerable difference of opinion exists with regard to the best classification of the family, some authorities including most of the species in the typical genus; this group below belongs to another, and recognizes quite a number of sub-families and still more genera. Here the family is divided into two groups: Rhinocerotinae and Elasmotheriinae, the latter including only Elasmotherium, and the former all the rest. In the Lower Oligocene of Europe we have Ronzolherium and in that of America Leptaceratherium (Trigonius), which were primitive species with persistent upper canines and three-toed forefeet. Possibly they belonged to the Amarynodontidae, but they may have been related to the Upper Oligocene Dicerotherium (Dicertherium), whose lower teeth seem to resemble those of the genus Rhinoceros to commence; these species constituting the subgenus Teleoceras. The living R. (Diceros) sumatrensis of south-eastern Asia indicates another subgenus, represented in the European Oligocene by Soricotherium, and in the Lower Pliocene of America by R. platyrhinus, in which two horns are combined with the presence of upper incisors and lower canines. Next we have the living African species, representing the subgenus Diceros, in which there is but a single horn for each forefoot. This group belongs to the genus Rhinoceros, and is represented in the European Oligocene by Aceratherium, in which the roots were reduced to the vertebrae of the frenulum and the clefts were formed by the calcaneous bone. A horn on the forehead probably indicates the existence of a large frontal horn.

PERISTYLE (Gr. περίπλοξ, round, and στόλος, column), in architecture, a range of columns (whether rectangular or circular on plan) in one or two rows, enclosing the sanctuary of a temple; the term is also applied to the same feature when built round the court in which the temple is situated and in Roman houses to the breathing space round which the private rooms of the family were arranged, which were entered from the covered colonnade round the court.

PERITONITIS, inflammation of the peritoneum—the serous membrane which lines the abdominal and pelvic cavities and gives a covering to their viscera. It may exist in an acute or a chronic form, and may be either localized or diffused. Acute peritonitis may be brought on, like other inflammations, by exposure to wet or cold, or in connexion with injury to, or disease of, some abdominal organ, or with general feebility of health. It is an occasional result of hernia and of obstruction of the bowels, of wounds penetrating the abdomen, of the perforation of viscera, as ulcer of the stomach, and of the intestine in typhoid fever, of the bursting of abscesses or cysts into the abdominal cavity, and also of the extensions of inflammatory action from some abdominal or pelvic organ, such as the appendix, the uterus, or bladder. At first localized, it may afterwards become general. The changes effected in the peritoneum are similar to those undergone by other serous membranes when inflamed. Thus, there are congestion; exudation of lymph in greater or less abundance, at first greyish and soft, thereafter yellow, becoming tough and causing the folds of the intestine to adhere together; effusion of fluid, either clear, turbid, bloody or purulent. The tough, plastic lymph connecting adjacent folds of intestine is sometimes drawn out like spun-glass by the movements of the intestines, forming bands and loops through or beneath which a piece of bowel may become fatally snared.

The symptoms of acute peritonitis usually begin by a shivering fit or rigor, together with vomiting, and with pain in the abdomen of a peculiarly severe and sickening character, accompanied with extreme tenderness, so that pressure, even of the bed-clothes, causes aggravation of suffering. The patient lies on the back with the knees drawn up, the abdomen being too firm to be easily depressed. Hair becoming curiously thick, and more so under the hands, is performed by movements of the chest only, the abdominal muscles remaining quiescent—unlike what takes place in healthy respiration. The abdomen becomes swollen by flatulent distension of the intestines, which increases the distress. There is usually constipation. The skin is hot, although there may be perspiration; the pulse is small, hard and wiry; the urine is scanty and high coloured, and is passed with pain. The face is pinched and anxious. These symptoms may pass off in a day or two; if they do not the case is apt to go on to a fatal termination. In such event the abdomen becomes more distended; hiccough, and the vomiting of brown or blood-coloured matter occur; the temperature falls, the face becomes cold and clammy; the pulse is exceedingly rapid and feeble, and death takes place from collapse, the mental faculties remaining clear till the close. When the peritonitis is due to perforation—as may happen in the case of gastric ulcer or of ulcers of typhoid fever, or in the giving way of a loop of strangulated bowel—the above-mentioned symptoms and the fatal collapse may all take place in from twelve to twenty-four hours. The disease, if untreated, is almost always fatal; on the contrary, if it is treated, it is not usually fatal. The actual cause of death is the absorption of the poisonous inflammatory products which have been poured out into the peritoneal cavity, as well as of the toxic fluids which have remained stagnant in the paralysed bowel.

Perhaps the commonest cause of septic peritonitis is the escape of, micro-organisms (bacillus coli) from the ulcerated, mortified or inflamed appendix (see APPENDICITIS). A generation or so ago deaths from this cause were generally placed under the single heading of "peritonitis," but at the present time the primary disease is shown upon the certificate which too often runs thus: appendicitis five days, acute peritonitis two days. Chronic peritonitis may occur as a result of the acute attack, or as a tuberculous disease. In the former case, the gravest symptoms have subsided, some abdominal pain continues, and there is considerable swelling of the abdomen, corresponding to a thickening of the peritoneum, and to the absence of fluid in the peritoneal cavity. This kind of peritonitis may also develop slowly without there having been any preceding acute attack. There is a gradual loss of strength and of weight. The disease is essentially chronic; it is not usually fatal.

Tuberculous peritonitis occurs either alone or in association with tuberculous disease of a joint or of the lungs. The chief symptoms are abdominal discomfort, or pain, and distension of the bowels. The patient may suffer from either constipation or diarrhoea, or each alternately. Along with these local manifestations there may exist the usual phenomena of tuberculous disease, viz. high fever, with rapid emaciation and loss of strength. But some cases of tuberculous peritonitis present symptoms which are not only obscure, but actually misleading.
PERIZONIUS—PERJURY

There may be no abdominal distension, and no pain or tenderness. The patient may lie quietly in bed, with the legs down straight, and he will have a marked elevation of temperature. There may be no vomiting and no constipation or diarrhoea. In some cases, the neighbouring coils of intestine having been glued together, a collection of serous fluid takes place in the midst of the mass, and, being walled in by the adhesions, forms a rounded tumour, dull on percussion, but not tender or painful. Such cases, especially when occurring in women, are apt to be mistaken for cystic disease of the ovary.

As regards the treatment of acute peritonitis, the first thing that the surgeon has to do is to assure himself that the disease is not due to a more internal cause, and, if it is due to that cause itself, it should be dealt with, to a septic disease of appendix or Fallopian tube, for instance, or to a toxic condition of the uterus, the result, perhaps, of a criminal or innocent abortion, or to a perforated ulcer of stomach or intestine. In many obscure cases the safest treatment is likely to be afforded by an exploratory abdominal section. If the patient is well made up his mind that the question of exploration is not to be entertained—a decision which should be arrived at only after most deliberate consultation—the best thing will be to apply fomentations to the abdomen, and to administer small and repeated doses of morphia by the skin—½ or ¼ grain—repeated every hour or so until the physiological effect is produced. As regards other drugs, it may be a question as to whether calomel or Epsom salts should be prescribed. As regards food, the only thing that can be safely recommended is a little hot water taken in sips. A bed-cradle should be placed over the patient in order to keep the weight of the bed-clothes from the abdomen. (E. O. *)

PERIZONIUS (or Accinctus), the name of Jakob Voorbroek (1651-1715), Dutch classical scholar, who was born at Appingedam in Groningen on the 26th of October 1651. He was the son of Anton Perizonius (1626-1672), the author of a once well-known treatise, De ratione studii theologici. Having studied at the university of Utrecht, he was appointed in 1682 to the chair of eloquence and history at Franeker through the influence of J. C. Graevius and Nicolaus Heinsius. In 1693 he was promoted to the corresponding chair at Leiden, where he died on the 6th of April 1715. The numerous works of Perizonius entitle him to a very high place among the scholars of his time. Special interest attaches to his edition of the Minerva of Francisco Sanchez or Sanctius of Salamanca (1st ed., 1587; ed. C. L. Bauer, 1793-1801), one of the last developments of the study of Latin grammar in its pre-scientific stage, when the phenomena of language were still regarded as for the most part disconnected, conventional or fortuitous. Mention should also be made of his Animadversiones historiae (1685), which may be said to have laid the foundations of historical criticism, and of his treatises on the Roman republic, alluded to by Niebuhr as marking the beginning of that new era of historical study with which his own name is so closely associated.

The article on Perizonius in Van der Aa's Biographisch Woordenboek der Nederlanden contains full biographical and bibliographical particulars; see also F. A. Eckstein in Ersch and Gruber's Allgemeine Encyklopädie.

PERJURY (through the Anglo-Fr. perjurie, modern perjury, Lat. perjurium, a false oath, perjurare, to swear falsely), an assertion upon an oath duly administered in a judicial proceeding before a competent court of the truth of some matter of fact, material to the question depending in that proceeding, which assertion the assessor does not believe to be true when he makes it, or on which he knows himself to be ignorant (Stephen, Digest of the Criminal Law, art. 135). In the early stages of legal history perjury seems to have been regarded rather as a sin than as a crime, and so subject only to supernatural penalties. The injury caused by a false oath was supposed to be done not so much to society as to the Divine Being in whose name the oath was taken (see Oath). In Roman law, even in the time of the empire, the perjurier fell simply under divine reprobation, and was not dealt with as a criminal, except where he had been bribed to withhold true or give false evidence, or where the oath was by the genius of the emperor. In the latter case punishment was no doubt inflicted more for the insult to the emperor than for the perjury. False testimony leading to the conviction of a person for a crime punishable with death constituted the offence of homicide rather than of perjury. In England, perjury, as being a sin, was originally a matter of ecclesiastical cognisance. At a later period, when it had become a crime, the jurisdiction of the spiritual courts became gradually confined to such perjury as was committed in ecclesiastical proceedings, and did not extend to perjury committed in a temporal court. The only perjury which was for a long time noticed at common law was the perjury of jurors. Attaint of jurors (see Attaint, Writ of) who were originally rather in the position of witnesses than of judges of fact, incidentally subjected them to punishment for perjury. Criminal jurisdiction over perjury by persons other than jurors seems to have been first assumed by the Star Chamber, acting under the powers supposed to have been conferred by an act of Henry VII. (1487). After the abolition of the Star Chamber by the Long Parliament in 1641 and the gradual diminution of the authority of the spiritual courts, perjury (whether in the strict sense of the word or the taking of a false oath in non-judicial proceedings) practically fell entirely within the jurisdiction of the ordinary criminal tribunals. At common law only a false oath in judicial proceedings is perjury. But by statute the perjury of perjurers has been extended to extra-judicial matters e.g., false declarations made for the purpose of marriage (The Marriage and Registration Act 1836), and false affidavit under the Bills of Sale Act 1878. False affirmation by a person permitted by law to affirm is perjury (The Evidence Further Amendment Act 1869; The Evidence Amendment Act 1879).

In order to support an indictment for perjury the prosecution must prove the authority to administer the oath, the occasion of administering it, the taking of the oath, the substance of the oath, the matter of the matter sworn, the falsity of the matter sworn, and the corrupt intention of the defendant. The indictment must allege that the perjury was willful and corrupt, and must set out the false statement or statements on which perjury is assigned, subject to the provisions of the Prosecutions for Perjury Act 1740 (which also applies to subornation of perjury). By that act it is sufficient to set out the substance of the offence, without setting forth the bill, answer, &c., or any part of the record and without setting forth the commission or authority of the court before whom the perjury was committed. The main point to be proved must be one of fact and not of mere belief or opinion. It is not homicide, as is Roman law, to procure the death of another by false evidence, but the Criminal Code, ss. 118, 164, proposed to make such an offence a substantive crime of greater gravity than ordinary perjury, and punishable by penal servitude for life. It is a rule of evidence, founded upon obvious reasons, that the testimony of a single witness is insufficient to convict on a charge of perjury. There must be corroboration of his evidence in some material particular. Perjury is a common law misdemeanour, not triable at quarter-sessions. Most persons in a judicial position have the right of directing the prosecution of any witness, if it appears to them that he has been guilty of perjury (The Criminal Procedure Act 1857). The provisions of the Venetian Indictments Act 1859 extend to perjury and subornation of perjury. By that Act no indictment for either of such offences can be preferred unless the prosecutor or accused is bound by recognizance, or the accused is in custody, or the consent of a judge is obtained, or (in the case of perjury) a prosecution is directed under the act of 1851.

Subornation of perjury is procuring a person to commit a perjury which he actually commits in consequence of such procurement. If the person attempted to be suborned do not take the oath, the person inciting him, though not guilty of subornation, is liable to fine and corporal punishment. Perjury and subornation of perjury is punishable at common law with fine and imprisonment. By the combined operation of the Perjury Act 1728 and later statutes, the punishment at present appears to be penal servitude for any term, or imprisonment or without hard labour for a term not exceeding seven years (see Stephen, Digest, art. 148). The punishment at common law was whipping, imprisonment, fine and pillory.
Perjury or prevarication committed before a committee of either House of Parliament may be dealt with as a contempt or breach of privilege as well as by prosecution. As to false oaths not perjury, it is a misdemeanor at common law, punishable by fine and imprisonment, to swear falsely before any person authorized to administer an oath upon a matter of common concern, under such circumstances that the false swearing, if committed in judicial proceedings, would have amounted to perjury. There are some cases of making false declarations which are punishable on summary conviction, e.g., certain declarations under the Registration of Births and Deaths Act 1874, and the Customs Consolidation Act 1876.

In Scotland the law, as a general rule, agrees with that of England. Perjury as defined by the statute is punished as a misdemeanor, as well as by a witness. A witness making a false affirmation is guilty of perjury (The Affirmation [Scotland] Act, 1865). The acts of 1851 and 1859 do not extend to Scotland. The trial, though usually by the court of justiciary, may be by the court of session if the perjury is committed in the course of an action before that court. The punishment is penal servitude or imprisonment at the discretion of the court. Formerly a person convicted of perjury was disabled from giving evidence in future; this disability was abolished by the Administration of Justice (Scotland) Act, 1862.

In the United States the common law has been extended by most states to embrace false affirmations and false evidence in proceedings not judicial. Perjury in a United States court is dealt with by an act of 1872. The offense of Malicious Perjury is punishable as a crime where the perjury is committed in the course of an action before that court. Statutory provisions founded upon the English act of 1749, have been adopted in some states. In the states which have not adopted such provisions, the indictment must set out the offense with the necessary particulars of time and place.

On the continent of Europe perjury is also regarded as an offence of gravity punishable by imprisonment for varying periods. In Germany, as in England, it was at one time a matter for the spiritual courts. The jurisdiction was transferred from the church courts to the civil courts in 1870–1871. In France, the perjury is punished as a fine of 2000 francs or imprisonment for not more than five years. Jurisdiction to punish perjury committed in the state courts belongs to the states, as the Constitution did not expressly delegate this power to the Federal government. Statutory provisions founded upon the English act of 1749, have been adopted in some states. In the states which have not adopted such provisions, the indictment must set out the offence with the necessary particulars of time and place.

**PERKIN, SIR WILLIAM HENRY** (1838–1907) English chemist, was born in London on the 12th of March 1838. From an early age he determined to adopt chemistry as his profession, although his father, who was a builder, would have preferred him to be an architect. Attending the City of London School he devoted all his spare time to chemistry, and on leaving, in 1853, entered the Royal College of Chemistry, then under the direction of A. W. Hofmann, in whose research laboratory he was in the course of a year or two promoted to be an assistant. Devoting his evenings to private investigations in a rough laboratory fitted up at his home, Perkin was fired by some remarks of Hofmann’s to undertake the artificial production of quinine. In this attempt he was unsuccessful, but the observations he made in the course of his experiments induced him, early in 1856, to try the effect of treating aniline sulphate with bichromate of potash. The result was a precipitate, aniline black, from which he obtained the colouring matter subsequently known as aniline blue or mauve. He lost no time in bringing this substance before the managers of Pullee’s dye-works, Perth, and they expressed a favourable opinion of it, if only it should not prove too expensive in use. Thus encouraged, he took out a patent for this process, and leaving the College of Chemistry, a boy of eighteen, he proceeded, with the aid of his father and brother, to erect works at Greenford Green, near Harrow, for the manufacture of the newly discovered colouring matter, and by the end of 1857 the works were in operation. That date may therefore be reckoned as that of the foundation of the coal-tar industry, which has since attained such important dimensions—in Germany, however, rather than in England, the country where it originated. Perkin also had a large share in the introduction of artificial alizarin (q.v.), the red dye of the madder root. C. Graebe and C. T. Liebermann in 1868 prepared that substance synthetically from anthracene, but their process was not practicable on a large scale, and it was left to him to patent a method that was commercially valuable. This he did in 1867, thus securing for the Greenford Green works a monopoly of alizarin manufacture for several years. About the same time he also carried out a series of investigations into kindred substances, such as anthraquinone. About 1874 he abandoned the manufacture of coal-tar colours and devoted himself exclusively to research in pure chemistry, and among the discoveries he made in this field was that of the reaction known by his name, depending on the condensation of aldehydes with fatty acids (see CINNAMIC ACID). Later still he engaged in the study of the relations between chemical constitution and rotation of the plane of polarization in a magnetic field, and enunciated a law expressing the variation of such rotation in bodies belonging to homologous series. For this work he was in 1889 awarded a Davy medal by the Royal Society, which ten years previously had bestowed upon him a Royal medal in recognition of his investigations in the coal-tar colours. The Chemical Society, of which he became secretary in 1869 and president in 1883, presented him with its Longstaff medal in 1889, and in 1890 he received the Albert medal of the Society of Arts. In 1906 an international celebration of the fiftieth anniversary of his invention of mauve was held in London, and in the same year he was made a knight. He died near Harrow on the 14th of July 1907.

His eldest son, WILLIAM HENRY PERKIN, who was born at Sudbury, near Harrow, on the 17th of June 1860, and was educated at the City of London School, the Royal College of Science, and the universities of Würzburg and Munich, became professor of chemistry at the Heriot-Watt College, Edinburgh, in 1887, and professor of organic chemistry at Owens College, Manchester, in 1892. His chief researches deal with the poly-methylene compounds, the alkaldoids, in particular hydrastine and berberine, and the camphors and terpenes (q.v.). He received the Davy medal from the Royal Society in 1904.

**PERKINS, CHARLES CALLAHAN** (1822–1886), American artist and author, was born in Boston and educated at Harvard, subsequently studying art in Rome and Paris. Returning to Boston, he helped to found the Museum of Fine Arts, of which he was honorary director, and for many years he played a leading part in artistic circles as a cultured critic and writer. His chief publications were *Tuscan Sculptors* (1864) and *Italian Sculptors* (1868) — replaced in 1883 by *The Historical Handbook of Italian Sculptors—Art in Education* (1870), and *Sepulchral Monuments in Italy* (1885).

**PERKINS, JACOB** (1766–1840), American inventor and physicist, was born at Newburyport, Massachusetts, in 1766, and was apprenticed to a goldsmith. He soon made himself known by a variety of useful mechanical inventions, and in 1818 came over to England with a plan for engraving bank-notes on steel, which ultimately proved a signal success, and was carried out by Perkins in partnership with the English engraver Heath. His chief contribution to physics lay in the experiments by which he proved the compressibility of water and measured it by a piezometer of his own invention (see Phil. Trans., 1830). He retired in 1834, and died in London on the 30th of July 1840.

His second son, ANGIER MARCH PERKINS (1799–1881), also born at Newburyport, went to England in 1827, and was the author of a system of warming buildings by means of high-pressure steam. His grandson, LOFTUS PERKINS (1834–1891), most of whose life was spent in England, experimented with the application to steam engines of steam at very high pressures, constructing in 1880 a yacht, the “Anthracite,” whose engines worked with a pressure of 500 lb to the sq. in.

**PERLEBERG,** a town of Germany, in the Prussian province of Brandenburg, on the Stepenitz, 6 m. N.E. from Wittenberg by the railway to Neustrelitz. Pop. (1905), 9502. It contains a fine Gothic Evangelical church, a Roman Catholic church, a synagogue and several schools, and has a town-hall, dating from the 15th century, and a Roland column. Its chief manufactures are machinery, soap, blacking and clogs.

PERLES—PERM

PERLES, JOSEPH (1835–1894), Jewish rabbi, was born in Hungary in 1835, and died at Munich in 1894. He was one of the foremost trained at the new type of seminary (Breslau). Perles' most important essays were on folklore and custom. There is much that is striking and original in his history of marriage (Die jüdische Hochzeit in nachthblicher Zeit, 1866), and of mourning customs (Die Leichenfeierlichkeiten in nachthblicher Judenreich, 1861), his contributions to the sources of the Arabian Nights (Zur rabbinischen Sprach- und Sagenkunde, 1873), and his notes on rabbinic antiquities (Beitrage zur rabbinischen Sprach- und Allertumskunde, 1863). Perles' essays are rich in suggestive, and have been the starting-point of much fruitful research. He also wrote an essay on Nachmanides, and a biography and critical appreciation of Rashba (1863).

I. A.

PERLITE, or PERLSTONE, a glassy volcanic rock which, when struck with a hammer, breaks up into small rounded masses that often have a pearly lustre. The reason for this peculiarity is obvious in microscopic sections of the rock, for many small cracks may be seen traversing the glassy substance. These mostly take a circular course, and often occur in groups, one within another. The circular cracks bound the little spheres into which the rock falls when it is struck, and the concentric fissures are the cause of the pearly lustre, by the reflection of light from enclosed films of air. Longer straight cracks run across the sections separating areas in which the circular fissures preponderate. By decomposition the fissures may be occupied by deposits of limonite, which make them more obvious, or by other secondary minerals. The glass itself often undergoes change along the cracks by becoming finely crystalline or devitrified, dull in appearance and slightly opaque in section. In polarized light the perlitic glass is usually quite isotropic, but sometimes the internal part of some of the spheres has a slight double refraction which is apparently due to strain. The glass found on the waste-heaps of glass-furnaces is sometimes very coarsely perlitic.

Perlitic structure is not confined to glass, but may be seen also in that variety of opal which is called hyalite. This forms small transparent rounded masses like drops of gum, and in microscopic section exhibits concentric systems of cracks. Hyalite, like perlite obsidian, is amorphous or non-crystalline. It is easy to imitate perlitic structure by taking a little Canada balsam and heating it on a slip of glass till most of the volatile matters are driven out; then drop it in a basin of cold water and typical perlitic structure will be produced. The reason is apparently the sudden contraction when the mass is chilled. In the glaze on tiles and china rounded or polygonal systems of cracks may often be seen which somewhat resemble perlitic structure but are less perfect and regular. Many rocks which are cryptocrystalline or felsitic, and not glassy, have perfect perlitic structure, and it seems probable that these were originally vitreous obsidians or pitchstones and have in process of time been changed to a finely crystalline state by devitrification. Occasionally in olivine and quartz rounded cracks not unlike perlite may be observed in obsidian.

Many perlitic rocks contain well-developed crystals of quartz, feldspar, augite or magnetite, &c., usually more or less corroded and rounded, and in the fine glassy base minute crystallites often abound. Some of the rocks have the resinosus lustre and the high percentages of combined water which distinguish the pitchstones; others are bright and fresh obsidians, and nearly all the older examples are dull, cryptocrystalline felsites. According to their chemical compositions they range from very acid rhyolites to trachytes and andesites, and the dark basaltic glasses or tachylites are sometimes highly perlitic. It is probable that most perlites are of intrusive origin, and the general absence of steam cavities in these rocks would support this conclusion, but some perlitic Hungarian rhyolites are believed to be lavas.

Very well known rocks of this kind are found in Meissen, Saxony, as dikes of greenish and brownish pitchstone. Other examples are furnished by the Tertiary igneous rocks of Hungary (Tokai, &c.), the Euganean Hills (Italy) and Ponza Island (in the Mediterranean). In mineralogical collections rounded nodules of brown glass varying from the size of a pea to that of an orange may often be seen labelled Marekanite. They have long been known to geologists and are found at Ocketsk, Siberia, in association with a large mass of perlitic obsidians. These globular bodies are, in fact, the more coherent portions of a perlite; the rest of the rock falls down in a fine powder, setting free the glassy spheres. They are subject to considerable internal strain, as is shown by the fact that when struck with a hammer or sliced with a lapidary's saw they often burst into fragments. Their behaviour in this respect closely resembles the balls of rapidly cooled, unannealed glass which are called Prince Rupert's drops. In their natural condition the marekanite spheres are doubly refracting, but when they have been heated and cooled under pressure the property and no longer exhibit any tendency to sudden disintegration.

In Great Britain Tertiary vitreous rocks are not common, but the pitchstone which forms the Scuir of Eigg is a dark andesitic porphyry with perlitic structure in its glassy matrix. A better example, however, is provided by a perlitic dacitic porphyry that occurs near the Tay Bridge in Fifeshire. The tachylytic basalt dikes of Mull are occasionally highly perlitic. At Sandy Braes in Antrim a perlitic obsidian has been found, and the Lea Rock, near Wellington in Shropshire, a devitrified obsidian which shows perlitic cracks and the remains of spherulites.

PERM, a government of east Russia, bounded S. by the governments of Orenburg and Ufa, W. by Vyatka, N.W. by Vologda, and E. by Tobolsk (Siberia). It has an area of 138,173 sq. m. Though administratively it belongs entirely to Russia in Europe, its eastern part (about 57,000 sq. m.) is situated in Siberia, in the basin of the Ob. The government is traversed from north to south by the Ural Mountains, 30 to 45 m. in width, thickly clothed with forests, and deeply excavated by rivers. The highest summits do not rise above 3600 ft. in the northern section of the range (the Vogulian Ural); in the central portion, between 50° and 60° 30' N., they once or twice exceed 5000 ft. (Denezhkin, 3560 ft.); but the chain soon sinks towards the south, where it barely attains an elevation of 3000 ft. Where the great Siberian road crosses it the highest point is 1400 ft.

The government is very well drained by rivers belonging to the Pechora, Tobol (affluent of the Ob) and Kama systems. The Pechora itself rises in the northern corner of the government, and its tributary the Volosnitsa is separated by a distance of less than a mile from the mouth of the Voulika, a tributary of the Kama, a circumstance of some commercial importance. The chief river of Perm, however, is the Kama, whose navigable tributaries the Chusovaya, Sylva and Kolva are important channels for the export of heavy iron goods to Russia. The government is dotted with a great number of lakes of comparatively trifling size, their total area being 720 sq. m., and with marshes, which are extensive in the hilly tracts of the north. Granites, diorites, porphyries, serpentines and Laurentian gneisses and limestones, containing iron, copper and zinc ores, constitute the main axis of the Ural chain; their western slope is covered by a narrow strip of Huronian crystalline slates, which disappear in the east under the Post-Tertiary deposits of the Siberian lowlands, while on the west narrow strips of Silurian limestones, quartzites and slates, and separate islands of Devonian deposits, appear on the surface. These in their turn are overlain with Carboniferous clays and sands, containing Coal Measures in several isolated basins. Perm may be divided into three, the Ural ridge, over these last, and covered with the so-called "variegated marls," which are considered as Triassic, and appear only in the western corner of the territory.

Perm is the chief mining region of Russia, owing to its wealth in iron, silver, platinum, copper, nickel, lead, chrome ore, manganese and auriferous alluvial deposits. Many rare metals, such as iridium, osmiridium, rhodium and ruthenium, are found along with the above, as also a great variety of precious stones, such as diamonds, sapphires, jaspers, tourmalines, beryls, phencatites, chrysoberyls, emeralds, aquamarines, topazes, ametysts, jades, malachite. Salt-springs occur in the west; and the mineral waters, though still little known, are worthy of mention. No less than 70% of the total area is occupied with forest; but the forests are distributed very unequally, covering 55% of the area in the north and only 25% in the south-east. Firs, the pine, cedar, larch, birch, alder and lime are the most common; the oak appears only in the south-west. The flora of
Perm presents a mixture of Siberian and Russian species, several of which have their north-eastern or south-western limits within the government. The climate is severe, the average temperature at different places being as follows:—

The estimated population in 1906 was 3,487,100, and consists chiefly of Great Russians, besides Bashkirs (including Meshcher- yaks and Teptyars), Permians or Permians, Tatars, Cheremisses, Syryenians, Votyaks and Voguls. Agriculture is the general occupation; rye, oats, barley and hemp are raised in all parts, and wheat, millet, buckwheat, potatoes and flax in the south. Cattle-breeding is specially developed in the south-east among the Bashkirs, who have large numbers of horses. Mining is developing steadily though slowly. The ironworks employ nearly 200,000 persons (chiefly in the Imperial iron works), and their aggregate output reaches an estimated value of 65,000,000 annually. The annual production of gold is valued at nearly half a million sterling, and of platinum at approximately a quarter of a million, the output of platinum being equal to 95% of the world's total output. Coal and coke to the extent of 300,000 to 500,000 tons, salt to 300,000 tons, asbestos and other minerals are also obtained. The first place among the manufacturing industries is taken by flour-mills. The cutting of precious stones is extensively carried on throughout the villages on the eastern slope of the Ural Mountains, the chief market for them being at Ekaterinburg. An active trade, greatly favoured by the easy communication of the chief centres of the mining industry with the market of Nizhny Novgorod on the one side and with the network of Siberian rivers on the other, is carried on in metals and metal wares, minerals, timber and wooden wares, tallow, skins, cattle, furs, corn and linseed. Large caravans descend the affluent of the Kama every spring, and reach the fairs of Laishev and Nizhny Novgorod, or descend the Volga to Samara and Astrakhan; while Ekaterinburg is an important centre for the trade with Siberia. The fairs at Irbit, second in importance only to that of Nizhny Novgorod (in the district of Shadrinsk) are centres for supplying Siberia with groceries and manufactured wares, as also for the purchase of tea, of furs for Russia, and of corn and cattle for the mining districts. The chief commercial centres are Ekaterinburg, Irbit, Perm, Kamyshlov, Shadrinsk and Cherdyn.

Perm is more largely provided with educational institutions and primary schools than most of the governments of central Russia. Besides the ecclesiastical seminary at Perm there is a mining school at Ekaterinburg. The Perm semestvo or provincial council is one of the most active in Russia in promoting the spread of education and agricultural knowledge among the peasants.

The government is intersected by a railway from Perm eastwards across the Ural, and thence southwards along their eastern slope to Ekaterinburg, Chelyabinsk (main Siberian trunk line) and Tyumen; also by a railway from Perm to Kotlas, at the head of the Northern Dvina.

History.—Remains of palaeolithic man, everywhere very scarce in Russia, have not yet been discovered in the upper basins of the Kama and Ob, with the exception, perhaps, of a single human skull found in a cavern on the Kama, and a small cave containing bones of Ursus spelaeus. Neolithic remains are met with in immense quantities on both Ural slopes. Still larger quantities of implements belonging to an early Finnish, or rather Ugrian, civilization are found everywhere in the basin of the Kama. Herodotus speaks of the richness of this country inhabited by the Ugrians, who kept up a brisk traffic with the Greek colony of Olbia near the mouth of the Dnieper, and with the Bosporus by way of the Sea of Azov and the Volga. The precise period at which the Ugrians left the district for the southern steppes of Russia (the Lebedia of Constantine Porphyrogenitus) is not known. In the 8th century, if not earlier, the Norsemen were acquainted with the country as Bjarmeland, and Byzantine annalists knew it as Permia. Nestor describes it as a territory of the Perm or Permians, a Finnish people.

The Russians penetrated into this region at an early date. In the 11th century Novgorod levied tribute from the Finnish inhabitants, and undertook the colonization of the country, which in the treaties of the 13th century is dealt with as a separate territory of Novgorod. In 1471 the Novgorod colonies in Perm were annexed to Moscow, which in the following year erected a fort to protect the Russian settlers and tradesmen against the Voguls, Ostiaks and Samoyedes. The mineral wealth of the country attracted the attention of the Moscow princes, and in the end of the 15th century Ivan III., sent two Germans to search for ores; these they succeeded in finding south of the upper Pechora. The Stroganovs in the 16th century founded the first salt- and ironworks, built forts, and colonized the Ural region. The rapidly-growing trade with Siberia gave a new impulse to the development of the country. This trade had its centres at Perm and Solikamsk, and later at Irbit. (F. A. K.; J. T. Be.)

PERM, a town of Russia, capital of the government of the same name, stands on the left bank of the Kama, on the great highway to Siberia, 1130 m. by rail and river N.E. of Moscow. Pop. (1879), 32,350; (1897), 45,403. During summer it has regular steam communication with Kazan, 803 m. distant, and it is connected by rail (311 m.) with Ekaterinburg on the east side of the town. The town is mostly built of wood, with broad streets and wide squares, and has a somewhat poor aspect, especially when compared with Ekaterinburg. It is the seat of a bishop of the Orthodox Greek Church, and has an ecclesiastical seminary and a military school, besides several scientific institutions (the Ural society of natural sciences, archives committee, technical society), and a scientific museum. Its industries develop slowly, but the chief works being ship-building yards, tanneries, chemical works, saw-mills, brickfields, copper foundries, machinery works, soap and candle factories and rope works. The government has a manufactory of steel guns and munitions of war in the immediate neighbourhood of the town.

The present site of Perm was occupied, as early as 1568, by a settlement named Brukhanova, founded by one of the Stroganovs; this settlement seems to have received the name of Perm in the 17th century. A copperworks was founded in the immediate neighbourhood in 1573, and in 1781 it received officially the name of Perm, and became an administrative centre both for the country and for the mining region.

PERMEABILITY, MAGNETIC, the ratio of the magnetic induction or flux-density in any medium to the inducing magnetic force. In the C.G.S. electromagnetic system of units the permeability is regarded as a pure number, and its value in empty space is taken as unity. The permeability of a metal belonging to the ferromagnetic class—iron, nickel, cobalt and some of their alloys—is a function of the magnetic force, and also depends upon the previous magnetic history of the specimen. As the force increases from zero the permeability of a given specimen rises to a maximum, which may amount to several thousands, and then gradually falls off, tending to become unity when the force is increased without limit. Every other substance has a constant permeability, which differs from unity only by a very small fraction; if the substance is paramagnetic, its permeability is a little greater than 1; if diamagnetic, a little less. The conception of permeability (Lat. per, through, and mea, to measure) was first given by Ampère, in 1821, who spoke of it as "conducting power for magnetism." (Experim. Researches, xxviii., and the term now in use was introduced by W. Thomson (Lord Kelvin), in 1872, having been suggested by a hydrokinetic analogy (Reprint of Papers on Electrostatics and Magnetism, xxx., xxiii.). It is generally of importance that the iron employed in the construction of electrical machinery should possess high permeability under the magnetic force to which it is to be subjected. (See ELECTROMAGNETISM and MAGNETISM.)
PERMEAMETER—PERMIAN

PERMEAMETER, an instrument for rapidly measuring the permeability of a sample of iron or steel with sufficient accuracy for many commercial purposes. The name was first applied by S. P. Thompson to an apparatus devised by himself in 1860, which indicates the mechanical force required to detach one end of the sample, arranged as the core of a straight electromagnet, from an iron yoke of special form; when this force is known, the permeability can be easily calculated. (See Magnetism.)

PERMIAN, in geology, the youngest and uppermost system of strata of the Palaeozoic series, situated above the Carboniferous and below the Trias. The term “Permain” (derived from the Russian province of Perm, where the rocks are extensively developed) was introduced in 1841 by Sir R. I. Murchison. In England the series of red sandstones, conglomerates, breccias and marls which overlie the Coal Measures were at one time grouped together in one great formation as the “New Red Sandstone,” in contradistinction to the Old Red Sandstone below the Carboniferous: they were likewise known as the Polkitive series (from Gr. polkitois, mottled) from their mottled or variegated color. They are now divided into two systems or groups of formations: the lower portion being included in the Palaeozoic series under the name Permian, the upper portion being relegated to the Mesozoic series and termed Trias. In Germany the name Dys was proposed by J. Marcou for the rocks of this age on account of the twofold nature of the series in Thuringia, Saxony, &c. The intimate stratigraphical relationship that exists in many quarters between the Permian rocks and the Carboniferous beds, and the practical difficulties in the way of drawing a satisfactory base-line to the system, have led to the adoption of the term Permo-carboniferous in South Africa, southern Asia, America, Australia and Russia, for strata upon this horizon: C. W. von Gümblen used “Post-carbon” in this sense. In a similar manner Permo-triassic has been employed in cases where a stratigraphical passage from rocks with Permian fossils to others bearing a Triassic fauna is apparent.

The Permian system in England consists of the following subdivisions:

1. Upper...
   3. Upper...
   2. Middle...
   1. Lower...

From the thicknesses here given it is evident that the Permian rocks have a very different development on the two sides of England. On the east side, from the coast of Northumberland southwards to the plains of the Trent, they consist chiefly of a great central mass of limestone. But on the west side of the Pennine Chain, and extending southwards into the central counties, the calcareous zone disappears, and we have a great accumulation of red, arenaceous and gravely rocks.

The lower subdivision attains its greatest development in the vale of the Eden, where it consists of brick-red sandstones, the “Pearth sandstone” being a typical member of calcareous; conglomerates, or breccia, locally known as “brockam,” derived from the waste of the Carboniferous Limestone. These red rocks extend across the Solway into the valleys of the Nith and Annan, in the south of Scotland, where they lie on the Silurian rocks. Their breccias consist of fragments of the adjacent Silurian greywackes and shales, but near Dumfries some calcareous breccias or “brockam” occur. These brecciated masses have evidently accumulated in small lakes or narrow fords. Much farther south, in Staffordshire, and in the districts of the Clent and Atherley Hills, the brecciated conglomerates in the Permian series attain a thickness of 100 ft. They have been shown by Sir A. C. Ramsay to consist in large measure of volcanic rocks, grits, slates and limestone, which can be identified with rocks on the borders of Wales. Some of the stones are 3 ft. in diameter and show distinct striation. The same writer pointed out that these Permian drift-beds cannot be distinguished by any essential character from modern glacial drifts; on the other hand, the formations extend over very different terrains.

The middle subdivision is the chief repository of fossils in the Permian system. Its strata are not red, but consist of a lower zone of hard brown shale with occasional thin limestone bands (Mali Slate) and an upper thick mass of dolomite (Magnesian Limestone). The latter is the chief feature in the Permian development of the east of England. It corresponds with the Zechstein of Germany, as the Marl Slate does with the Kupfer-schiefer. It is a very variable rock in its lithological characters, being sometimes dull, earthy, fine-grained and fossiliferous, crystalline, and composed of globular, reniform, botryoidal, or other irregular concretions of crystalline and frequently internally radiated dolomite. Though the Magnesian Limestone runs as a thick persistent zone deep into the east of England, it is represented on the Lancashire and Cheshire side by bright red and variegated sandstone covered by a thin group of red marls, with numerous thin courses of limestone, containing Schizodus, Bakkenellia and other characteristic fossils of the Magnesian Limestone.

Concerning the rocks classed as Permian in the central counties of England there exists some doubt; for recent work tends to show that the lower parts are clearly related to the Carboniferous rocks by their fossils, while the upper is more conclusively associated with the higher beds from the Trias. Similarly in south Devon, where red sandstones and coarse breccias are well exposed, it has been found difficult to say whether the series should be regarded as one or two, though the prevailing tendency is to retain them in the latter system.

The “Dyas” type of the system is found in enormous masses of strata flanking the Harz Mountains, and also in the Rhine provinces, Saxony, Thuringia, Bavaria and Bohemia. In general, the series is said to consist of a calcareous conglomeratic subception above the higher one more calcareous; the former is known as the Rothleitena, the latter as the Zechstein. On the south side of the Harz Mountains the following subdivisions are recognized:

The name Rothleitena or Rothlidiitena (red-dead-layer) was given by the miners because their ores disappeared in the red ore. The general term Kupfer-schiefer, Kupfer-schiefer, although so thin, has been worked in the Mansfield district for a long period; it contains abundant remains of fish (Palaoniscus, Platyomus) and plants (Ulmannia). The beds of rock-salt in the German Zechstein are the greatest in the Bavarian-Upper Rhine valley; at Speyerberg near Berlin it has been penetrated to a depth of 4000 ft. Associated with the salt, gypsum and anhydrite are numerous...
potassium and magnesium salts, including carnallite, kieserite, and polyhalite, are exploited at Stassfurt and are the only important potassium deposits known. Permian rocks of the Rothliegende type are scattered over a wide area in France, where the lower beds are usually conformable with the Carboniferous. In the upper beds occur the bituminous or "Baghse" shale of Autun. In Russia strata of this age cover an enormous area, in the Urals region, in the governments of Perm, Kazar, Kostroma, and in Armenia. The upper beds overlie the Carboniferous, and are overlain by the Kanguzer limestones and dolomites. These are followed by red freshwater sandstones, which come in an important series of copper-bearing sandstones and conglomerates. Above this, in Kostroma, Vyatka and Kazar there is a calcareous and dolomitic series, the so-called "Russian Zechstein" with marine fossils; the uppermost beds are red marls, with few freshwater fossils, the "Tartarian" beds.

The character of the fossils in the Permian of the Mediterranean and south-east Europe—well exemplified in the deposits of Sicily—goes together with their more generally calcareous nature, indicating a more open sea and more stable marine conditions than obtained farther north. The sea is traceable across south-east Russia into the middle region through the Baltic Sea, and into the Salt Range of India, where the Permian deposits may be seen, as representatives of the normal marine plan of Permian times. Southwards, however, of the Norrlands River another and quite distinct flora and fauna, of the "Upper Permian" type, viz., the lower portion of the great fresh-water Gondwana system. The coarse Talchir conglomerates at the base are succeeded by the sandstones and shales of the Karakhari group, with numerous coal-bearing beds. The "Upper Permian" type of rocks, which are very simple, are noted for their vast areas of the Gondwana, the Great coal measures, and marine beds, of which the Upper Permian of New Zealand (in the Tauranga basin) is a notable type, and the Lower Permian of New South Wales; of the Tauranga basin, the Bowen River beds of Queensland, and of the Pacific and present-day area, in the North Island of New Zealand (in the Tauranga basin), and in the Pacific and present-day area, in the North Island of New Zealand (in the Tauranga basin), and in the Prince Edward Island in the south, where they succeed the Carboniferous rocks very regularly. West of the Mississippi, in Texas (7000 ft.) including the Witches' wells, Clear Fork and the Eagle Ford, and the Big Bend of the Rio Grande, the Permian is more extensive and on the whole is more readily separable from the Carboniferous. Here the lower beds are marine and contain many limestone and dolomite; the higher beds are mainly red sandstones and marls with gypsum; in Texas it is of interest to note the occurrence of copper-stained strata. These upper"Bed" are often not clearly distinguishable from the Trias.

*Note: The table above provides a simplified representation of the Permian stratigraphy, showing the approximate correlations between different regions and formations.*

PERNAMBUCO, a north-eastern state of Brazil, bounded N. by Ceará and Paraíba, E. by the Atlantic, S. by Alagoas and Bahia, and W. by Piauí. Area, 49,733 sq. m.; pop. (1900), 1,718,150. It comprises a comparatively narrow coastal zone, a high inland plateau, and an intermediate zone formed by the terraces and slopes between the two. Its surface is much broken by the remains of the ancient plateau which has been worn down by erosion, leaving escarpments and ranges of flat-topped mountains, called chapadas, capped in places by horizontal layers of sandstone. Ranges of these chapadas form the boundary lines with three states—the Serras dos Irmãos and Vermelha with Piauí, the Serra do Araripe with Ceará, and the Serra do Cariri with Bahia. The climate is hot, humid climate, relieved by some extent by the south-east trade winds. This region is locally known as the matts (forests). The middle zone, called the caatinga or agreste region, has a drier climate and lighter vegetation. The inland region, called the sertão, is high, stony, and dry, and frequently devastated by prolonged droughts (secas). The climate is characterized by hot days and cool nights, and is considered healthy, though the daily change tends to provoke bronchial, tachyphylactic and inflammatory diseases.

There are two clearly defined seasons, a rainy season from March to June, and a dry season for the remaining months. The rivers of the state include a number of small plateau streams flowing southward to the São Francisco River, and several large streams in S. eastern part, flowing eastward to the Atlantic. The former are the Moxotó, Emu, Pajéú, Terra Nova, Brígida, Bôa Vista and Pontal, and are dry channels the greater part of the year. The largest of the coastal rivers is the Goiana, which is formed by the confluence of the Trancunhaém and Capibaribe-mirim, and drains a rich agricultural region in the north-east part of the state; the Capibaribe, which has its source in the Serra de Jacarará and flows eastward to the Atlantic at Recife with a course of nearly 300 m.; the Ipojuca, which rises in the Serra de Aldeia Velha and reaches the coast south of Recife. The Serinhaém and the Una. A large tributary of the last—the Rio Jacuípe, forms part of the boundary line with Alagoas.

Pernambuco is chiefly agricultural, the lowlands being devoted to sugar and fruit, with coffee in some of the more elevated localities and cotton with the most of the superior lands and better beds and stock, and the sertão to grazing and in some localities to cotton. Sugar, molasses, rum (gwerdente or cachaca), tobacco and fruit are largely exported. Coco-nuts, cacao, bananas, mangos and other tropical fruits are produced in profusion, but the production of foodstuffs (beans, Indian corn, mandioca, &c.) is not sufficient for local consumption. Mangleira rubber is collected to a limited extent, and piassava fibre is an article of export. Orchids are also collected for export in the districts of Garanhuns and Timbába. Coton-weaving and cigar-making are the principal manufacturing industries, after the large engenhos devoted to the manufacture of sugar and rum. The railways of the state are the Recife and São Francisco (77 m.), Central de Pernambuco (132 m.) and Sul de Pernambuco (120 m.)—the government properties leased to the Great Western of Brazil Railway Co., Ltd., since 1901. Besides these there are the line from Recife to Limoero and Timbába (112 m.), with an extension from Timbába to Pilar (24 m.). All these lines concentrate at the port of Recife. The capital of the state is Recife, commonly known among foreigners as Pernambuco. There are a number of large towns in the state, but the census returns include their populations in those of the municipios (communes) to which they belong. The most important are: Bezerrós (17,484), Bom Jardim (40,160), Brejo da Madre de Deus (13,653), a town of the higher agreste region, Cabo (13,337), Caruarú (17,844), Escada (9331), Garanhuns (37,288, covering six towns and villages), Glória de Goytá (24,554), Goyanna, Limoero (21,756), Olinda (8080), the old colonial capital and episcopal see, Rio Formosa (6608), Timbába (9514) and Pernova (3242).

Pernambuco was first settled in 1526 by Christóvão Jacques, who founded and settlement on the Rio Igarassú that was afterwards abandoned. The first permanent settlement was made by Duarte Coelho Pereira at Olinda in 1530, and four years later he was granted a capitania of 50 leagues extending from the mouth of the São Francisco northward to that of the Igarassú. Adjacent to this grant on the north was the capitania of Itamaracá, granted to Pero Lopes de Souza, which covered the remainder of the present state. The capitania of Pernambuco was ably governed and took an active part in the expulsion of the French from the trading posts established along the coast northward to Maranhão, and in establishing Portuguese colonies in their places. In 1630 Pernambuco was occupied by the Dutch and continued under their rule until 1654. Although an active guerrilla warfare went on, the Dutch, among a large part of the colonists, were not as much to promote the agricultural and commercial interests of the colony, especially under the wise administration of Maurice of Nassau. In 1817 Pernambuco was the scene of a revolutionary outbreak, which resulted in the separation of the present states of Alagoas and Rio Grande do Norte, Ceará and Paraíba having been detached in 1799. There was another insurrection in 1822 when the Portuguese captain-general, Luiz de Rego, and his garrison was expelled, and in 1824 dissatisfaction with the arbitrary proceedings of Dom Pedro I. at Rio de Janeiro led to a separatist revolution for the formation of a new state, to be called the Federação do Equador. There was another outbreak in 1831 and frequent disorders down to 1848, when they culminated in another unsuccessful revolution. The population of the Pernambuco sertão has always been noted for its turbulent, lawless character, due partly to distance from the coast where the bulk of the population is concentrated, partly to difficult means of communication, and partly to the fact that this remote region has long been the refuge of criminals from the coast towns.

Pernau (in Russ. Pernov and in Esthonian Pernolin), a seaport and watering-place of western Russia, in the government of Livonia, 155 m. N. of Riga, on the left bank of the Pernau or Perno, which about half a mile farther down enters the Bay of Perno, the northern arm of the Gulf of Riga. Pop., 12,856. The harbour is usually free from ice from the end of April to the middle of December.

Founded on the right side of the river in 1255 by one of the bishops of Livonia, Osela, this port soon became a flourishing place. In the 16th century it was occupied in succession by the Swedes, the Poles and the Teutonic Knights. After 1599 the Poles transferred the town to the left side of the river; and in 1642 the Swedes, who had been in possession since 1617, strengthened it with regular fortifications. In 1710 it was taken by the Russians, and the fortress is now demolished.

Perne, Andrew (c. 1519-1580), vice-chancellor of Cambridge University and dean of Ely, born about 1519, was son of John Perne of East Bilney, Norfolk. He was educated at St John's college, Cambridge, graduating B.A. in 1539, B.D. in 1547 and D.D. in 1552. He was elected fellow of Queens' in 1540, and vice-president in 1551, and was five times vice-chancellor; but he owes his notoriety to his remarkable versatility, and, like the vicar of Bray, he was always faithful to the national religion, whatever it might be. In April 1547 he advocated Catholic doctrines, but recanted two months later, and his
PERONNE—PERPENDICULAR PERIOD

Protestant faith was strengthened during Edward VI.'s reign; he was appointed a royal chaplain and canon of Windsor. Soon after Mary's accession, however, he received the error of his ways and was made master of Peterhouse in 1554 and dean of Ely in 1557. He preached the sermon in 1556 when the bodies of Bucer and Fagius were disinterred and burnt for heresy, and also in 1557 when these proceedings were reversed and the dead heretics were rehabilitated. In Elizabeth's reign he subscribed the Thirty-nine Articles, denounced the pope and tried to convert Abbot Feckenham to Protestantism; and in 1584 Whigfield in vain recommended him for a bishopric. He died on the 26th of April 1589. He was selected as the type of Anglican prelate by the authors of the Martin Mar-prelate tracts and other Puritans, who nicknamed him "Old Andrew Turncoat," "Old Andrew," "Old Father Palinode." Cambridge wits, it was said, translated "perno" by "I turn, I rat, I change often"; and a coat that had often been turned was said to have been "perned." (A. F. P.)

PERONNE, a town of northern France, capital of an arrondissement of the department of Somme, on the right bank of the Somme at its confluence with the Cologne, 35 m. E. by N. of Amiens by rail. Pop. (1906), 36,068. The church of St Jean (1509-1525) was greatly damaged during the bombardment of 1870-71, but has since been restored. The castle of Peronne still retains four large conical-roofed towers dating from the middle ages, one of which is said to have been the prison of Louis XI. in 1468, when he was forced to agree to the "Treaty of Péronne." Péronne has a sub-prefecture, a tribunal of first instance and a communal college. Its trade and industry are of little importance.

The Frankish kings had a villa at Péronne, which Clovis II., gave to Erchinoalda, mayor of the palace. The latter founded a monastery here, and raised in honour of St Fursy a collegiate church, which was a wealthy establishment until the Revolution; it is the burial-place of Charles the Simple, who died of starvation in a dungeon in Péronne, into which he had been thrown by the count of Vermandois (929). After the death of Philip of Alsace, Péronne, which he had inherited through his wife, escheated to the French Crown in the reign of Philip Augustus, from whom in 1206 it received a charter. By the treaty of Arras (1435) it was given to the Burgundians; it was recovered by Louis XI., it passed again into the hands of Charles the Bold in 1465. On the death of Charles, however, in 1477, Louis XI. resumed possession. In 1536 the emperor Charles V. besieged Péronne, but without success; in its defence a woman called Marie Fouré greatly distinguished herself. A statue of her stands in the town; and the anniversary of the raising of the siege is still celebrated annually. It was the first town after Paris at which the League was proclaimed in 1577. Péronne's greatest misfortunes occurred during the Franco-German War. It was invested on the 27th of December 1870, and bombarded from the 28th to the 9th of the following January, upon which date, on account of the sufferings of the civil population, among whom small-pox had broken out, it was compelled to capitulate.

PEROVSKITE, or PEROFSKITE, a mineral consisting of calcium tinate, CaTiO₃, usually with a small proportion of the calcium replaced by iron. The crystals found in schistose rocks have the form of cubes, which are sometimes modified on the edges and corners by numerous small plates; others are prismatic, the crystals occurring as an accessory constituent of eruptive rocks are octahedral in form and microscopic in size. Although geometrically cubic, the crystals are always doubly refracting, and they sometimes show evidence of complex mictic twinning; their structure as shown in polarized light is very similar to that of the mineral boricite, and they are therefore described as pseudo-cubic. There are distinct cleavages parallel to the faces of the cube. The colour varies from pale yellow to blackish-brown and the lustre is adamantine to metallic; the crystals are transparent to opaque. The index of refraction is high, the hardness 5½ and the specific gravity 4½. The mineral was discovered at Achmatovsk near Zlatomst in the Urals by G. Rose in 1839, and named in honour of Count L. A. Perovsky; at this locality large cubes occur with calcite and magnetite in a chlorite-schist. Similar crystals are also found in talc-schist at Zermatt in Switzerland. The microscopic octahedral crystals are characteristic of mellite basalt and nepheline basalt; they have also been found in peridotite and serpentinites.

PEROWNE, JOHN JAMES STEWART (1823-1904), English bishop, was born, of Huguenot ancestry, at Burdwan, Bengal, on the 13th of March 1823. He was educated at Norwich and at Corpus Christi College, Cambridge, becoming a fellow in 1849. After holding a chair in King's College, London, he was appointed vice-principal at St David's College, Lampeter (1862-1872). In 1868 he was Hulsean lecturer, taking as his subject Immortality. He was elected canon of Llandaff in 1869, dean of Peterborough in 1878, and in 1891 succeeded Henry Philpott as bishop of Worcester. Perowne was a good Hebrew scholar of the old type and sat on the Old Testament Revision Committee. He is best remembered as the general editor of the Cambridge Bible for Schools and Colleges. His chief works were a Commentary on the Book of Psalms (2 vols., 1864-1868) and a life of Bishop Thirlwall (1877-1878). He resigned his see in 1901, and died on the 6th of November 1904.

PEROT (Pérotins, Priscus, fr. 33; Perese, Procop. Pers. i. 3 and Agath. i. 27; the modern form of the name is Peresz, cf. Firuzabad), Sassanian king of Persia, A.D. 437-484, son of Vazdegerd II. He rebelled against his brother Homiæl III., and in 459 defeated and killed him with the help of the Ephthalites, or White Huns, who had invaded Bactria. He also killed most of his other relatives, and persecuted the Christians. But he favoured the introduction of Nestorianism, in opposition to the orthodox creed of Byzantium. With the Romans he maintained peace, but he tried to keep down the Ephthalites, who began to conquer eastern Iran. The Romans supported him with subsidies; but all his wars were disastrous. Once he was himself taken prisoner and had to give his son Kavadh as hostage till after two years he was able to pay a heavy ransom. Then he broke the treaty again and advanced with a large army. But he lost his way in the eastern desert and perished with his whole army (484). The Ephthalites invaded and plundered Persia for two years, till at last a noble Persian from the old family of Karen, Zarmîhr (or Sukhra), restored some degree of order. He raised Balah, a brother of Perész, to the throne.

PERPENDICULAR PERIOD, the term given by Thomas Rickman to the third period of Gothic architecture in England, in consequence of the great predominance of perpendicular lines. In the later examples of the Decorated period the omission of the circles in the tracery had led to the employment of curves of double curvature which developed into flamboyant tracery, and the introduction of the perpendicular lines was a reaction in the contrary direction. The mullions of the windows (which are sometimes of immense size, so as to give greater space for the stained glass) are carried up into the arch mould of the windows, and the upper portion is subdivided by additional mullions. The buttresses and wall surface are likewise divided up into vertical panels. The doorways are frequently enclosed within a square head over the arch mouldings, the spandrels being filled with quatrefoils or tracery. Inside the church the diagonal, or its place is filled with panelling, and greater importance is given to the clerestory windows which constitute the finest features in the churches of this period. The mouldings are flatter and less effective than those of the earlier periods, and one of the chief characteristics is the introduction of large elliptical hollows. The finest features of this period are the magnificent timber roofs, such as those of Westminster Hall (1395), Christ Church Hall, Oxford, and Crosby Hall.

The earliest examples of the Perpendicular period, dating from 1360, are found at Gloucester, where the masons of the cathedral would seem to have been far in advance of those in other towns. Among other buildings of note are the choir and tower of York Cathedral (1389-1407), the nave and western transepts of Canterbury Cathedral (1378-1411), and the tower...
PERPENT—PERPETUAL MOTION

(towards the end of the 15th century); New College, Oxford (1380–1386); the Beauchamp Chapel, Warwick (1381–1391); the nave and aisles of Winchester Cathedral (1390–1410); the transept and tower of Merton College, Oxford (1424–1450); Manchester Cathedral (1422); the central tower of Gloucester Cathedral (1454–1457), and that of Magdalen College, Oxford (1475–1480). To those examples should be added the towers at Wrexham, Coventry, Evesham, and St Mary’s at Taunton, the first being of exceptional magnificence.

PERPENT, or PARPENT STONES, in architecture, bond or “through stones,” the diastres of the Greeks and Romans, long stones going right through walls, and tying them together from face to face. The O. Fr. parpain, modern parpaing, from which this word is derived, is obscure in origin. It may be from a supposed Lat. perpago, perpagnis, formed like compago, a joint, from the root of tangere, to fasten, and meaning “something fastened together,” or from some popular corruption of Lat. perpendicularum, plummet or plum-line (pir or pendre, to hang), referring to the smooth perpendicular faces of the stone.

PERPETUAL MOTION, or PERPETUUM MOBILE, in its usual significance, not simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed. Briefly, a perpetual motion usually means a machine which will create energy.

The earlier seekers after the “perpetuum mobile” did not always appreciate the exact nature of their quest; for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat. Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding corn, and so on. Like the exact quadrature of the circle, the transmutation of metals and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest. Just as some of the most interesting branches of modern pure mathematics sprang from the problem of squaring the circle, as the researches of the alchemists developed into the science of modern chemistry, so, as the result of the vain search after the perpetual motion, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreatable and indestructible in the ordinary course of nature; even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master’s work; and it was just as reasonable to suppose that a structure of wood, brass and iron could be found to work under like conditions. The disproof is in both cases alike. No such spirit has ever existed, save in the imagination of his describer, and no such machine has ever been known to act, save in the fancy of its inventor.

The principle of the conservation of energy, which in one sense is simply denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment only dates from the middle of the 19th century, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been shown to accord with it, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to trace its power to some hidden source of a kind already known; or in the last resort he would seek for a source of energy of a new kind and give it a new name. Any assertion of creation of energy by means of a mere machine would have to be authenticated in many instances, and established by long investigation, before it could be received in modern science. The case is precisely as with the law of gravitation; if any apparent exception to this was observed in the case of some heavenly body, astronomers, instead of denying the law, would immediately seek to explain the occurrence by a wider application of it, say by including in their calculations the effect of some disturbing body hitherto neglected. If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, and, provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays. The interest of such cases is that attaching to the morbid anatomy of the human mind. Perhaps the most striking feature about them is the woful sameness of the symptoms of their madness. As a body perpetual-motion seekers are ambitious, lovers of the short path to wealth and fame, but wholly superficial. Their inventions are very rarely characterized even by mechanical ingenuity. Sometimes indeed the inventor has simply bewildered himself by the complexity of his device; but in most cases the machines of the perpetual motionists are of child-like simplicity, remarkable only for the extraordinary assertions of the inventor concerning them. Wealth of ideas there is none; simply assertions that such and such a machine solves the problem, although an identical contrivance has been shown to do no such thing by the brutal test of standing still in the hands of many previous inventors. Hosts of the seekers for the perpetual motion have attacked their insoluble problem with less than a schoolboy’s share of the requisite knowledge; and their confidence as a rule is in proportion to their ignorance. Very often they get no further than a mere prospectus, on the strength of which they claim some imaginary reward, or offer their precious discovery for sale; sometimes they get the length of a model which wants only the last perfection (already in the inventor’s brain) to solve the great problem; sometimes fraud is made to supply the motive power which their real or pretended efforts have failed to discover.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the “perpetuum mobile” was an impossibility. We find the Paris Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they class with solutions of the duplication of the cube, the trisection of an angle and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his Principia states, as far as ordinary mechanics are concerned, a principle which virtually amounts to the same thing.

The famous proof of P. de la Hire simply refers to some of the more common gravitational perpetual motions. The truth is, as we have said already, that, if proof is to be given, or considered necessary, it must proceed by induction from all physical phenomena.
PERPETUAL MOTION

It would serve no useful purpose here to give an exhaustive historical account of the vagaries of mankind in pursuit of the "perpetual motion." The reader may refer to Henry Dirck's Perpetuum Mobile (2 vols., 1861-69), from which, for the most part, we select the following facts.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids. We have not read of any actual proposal of the kind, but the most obvious thing to imagine in this line is a ball made of a substance which intercepts gravitational attraction. If this could be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work; then, removing the plate, we could allow the body to fall and do work. Moreover, we think it is highly probable that the invention of the gravitation interpolter, beholding a perpetual motion complete. The great difficulty is that no one has found the proper material for an interpolter.

First, it represents one of the most ancient and often-repeated of gravitational perpetual motions. The idea is that the balls rolling in the compartments between the felloe and the rim of the wheel will, by the laws of motion, so comport themselves that the moment about the centre of those on the descending side counteracts the moment of those on the ascending side. Endless devices, such as curved spokes, levers with elbow-joints, eccentric weights, etc., have been put forth for effecting this impossibility. The student of dynamics at once convinces himself that no machinery can effect any such result, because if the wheel is a complete turn, so that each ball returns to its original position, the whole work done by the ball will, at the most, equal that done on it. We know that in each step the kinetic energy given to the whole system of wheels and balls is equal to that taken from the potential energy of the balls less what is dissipated in the form of heat by frictional forces. The potential energy of the balls and balls be the kinetic energy—save that the friction in both cases leads to dissipation. So that, whatever the system may lose, it can, after it is left to itself, never gain energy during its motion.

Of the two famous perpetual motions of history, viz. the wheels of the marquis of Worcester (d. 1667) and of Councillor Orffyreus, were probably of this type. The marquis of Worcester gives the following account of his machine in his Century of Inventions (art. 56):

"To provide and make that all the Weights of the descending side of a Wheel shall be perpetually from the Centre than those of the mounting side, and yet in number and heft to one side as the other. A most incredible thing, if not seen but tried before the late king (of Olney Memory), in which there were two Extraordinary Embassadors accompanying His Majesty, and the Duke of Richmond, and Duke Hamilton, with most of the Court, attending him. The Wheel was 14. Foot over, and 40. Weights of 50. pounds apiece. Sir William Balfour, then Lieutenent of the Tower, can justify it, with several others. They all saw that no sooner these great Weights passed the Diameter-line of the lower side, but they hung a foot further from the Centre, nor so sooner passed the Diameter-line of the upper side but they hung a foot nearer. Be pleased to judge the consequence."

Orffyreus (whose real name was Johann Ernst Elias Bessler) (1680-1745) also obtained distinguished patronage for his invention. His last wheel, for he appears to have constructed more than one, was 12 ft. in diameter and 1 ft. 2 in. broad; it consisted of a light fragment of wood, covered with oilcloth so that the interior was concealed, and was mounted on an axle which had no visible connexion with any external mover. It was examined and approved of by the landgrave of Hesse-Cassel, in whose castle at Weissenstein it is said to have gone for eight weeks in a sealed chamber. The most remarkable thing about this machine is that it evidently imposed upon the mathematician W. J. 'sGravesande, who wrote a letter to Newton giving an account of his examination of Orffyreus's wheel undertaken at the request of the landgrave, that it was a perpetual motion, in the way of the earlier notions of the possibility of perpetual motion, and indicates his opinion that the invention of Orffyreus is worthy of investigation. He himself, however, was not allowed to examine the interior of the machine, as he himself says, because he had destroyed it, as a result of the circumstance. It was a story that he did so on account of difficulties with the landgrave's government as to a licence for it; another that he was annoyed at the examination by 'sGravesande, and wrote on the wall of the room during the interview the word 'Perpetual Motion.'

The overbalanced wheel perpetual motion seems to be as old as the 13th century. Dircks quotes an account of an invention by the architect whose sketchbook is still preserved in the Écoles des Chartes at Paris. De Honecort says, "Many a time have skilful workmen tried to contrive a wheel that shall turn of itself; here is a way to do it by means of an uneven number of mallots, or by quicksilver." He thereupon gives a rude sketch which he says is joined to its circumference. It would appear from some of the manuscripts of Leonardo da Vinci that he had worked with similar motions. Another scheme of the perpetual motionist is a water-wheel which shall feed its own motion. This notion is as old as the first miller who experienced the difficulty of a dry season. One form is figured in the Mathematica Magic (1648) of Bishop Wilkins (1614-1672); the essential part of it is the water-wheel with a mechanism like the machines of this class. Some of the later ones dispense with even the subtility of the water-wheel, and boldly represent a water-wheel pumping the water upon its own buckets.

In several monographs on the hydrostatical paradox are not uncommon; Denis Papin exposes one of these in the Philosophical Transactions for 1688. The most naive of these devices is that illustrated in fig. 2, viz. the idea of which is, that by the quantity of water in the wider part of the vessel, the smaller quantity in the narrower part, so that the vessel shall run over at C, and so on continually.

Capillary attraction has also been a favourite held for the vain quest; for, if by capillary action fluids can be made to displace the law of gravitation, the sum of their own weight, what so easy as to produce a continual ascent: and overflow, and thus perpetual motion? Various schemes of this kind, involving the endless land which would raise more water by its capillary action on one side than on the other, have been proposed. The most celebrated is that of Sir William Congreve (1772-1828). EFG (fig. 3) is a inclined plane over pulleys; at the top and bottom track the fragments of his model that he had devised an endless band of heavy weights jointed together. The whole was made to descend, and the capillary action rises the water in ab, whereas the same thing cannot have proceeded from the water in the part ad, since the weights squeeze the water out. Hence, inch inch of the ab is heavier than ad; but we know that if ab were only just as heavy as inch for inch, then it would be in equilibrium, if the heavy chain be also uniform; therefore the extra weight of ab would cause the chain to move in the direction of the arrow, and this will go on continually.

The more recent ideas of the exoric vehicles, or bodies that are of energy, such as electricity and magnetism, are more seldom drawn upon by perpetual-motion inventors than might perhaps be expected. William Gilbert, in his treatise De Magnete, alludes to some of them, and Bishop Wilkins mentions among others a machine wherein a loadstone is so disposed

---

1 We may here notice, so far as more recent times are concerned, the claim of an American enthusiast, who, having worked a Hampson plant for liquefying air, stated that 3 lb. of liquid air sufficed to liquefy ten, and of these ten seven could be employed as a source of motive power, whilst the remaining three would produce another 10 lb. of the liquid gas. There was thus available an inexhaustible supply of energy. The absurdity of the proposition is obvious to any acquainted with the laws of thermodynamists. James Watt (1736-1819) and Henry Cavendish (1731-1810) are questioned by the Hon. R. J. Strutt. This consists of a vacuum vessel from the top of which a short tube containing a fragment of a radioactive substance. At the lower end of this tube there are two gold leaves as in an electroscope. Fused into the sides of the vessel are two large cylinders, one containing a radioactive substance described by the Hon. R. J. Strutt. This consists of a vacuum vessel from the top of which a short tube containing a fragment of a radioactive substance. At the lower end of this tube there are two gold leaves as in an electroscope. Fused into the sides of the vessel are two large cylinders, one containing a radioactive substance described by the Hon. R. J. Strutt. This consists of a vacuum vessel from the top of which a short tube containing a fragment of a radioactive substance.
that it shall draw unto it on a reclined plane a bullet of steel, which, still, as it ascends near to the loadstone, may be contrived to fall through some hole in the plane and so to return unto the place whence at first it began to move, and being there, the loadstone will again attract it; and, if the place and manner of this hole, it will fall down again, and so the motion shall be perpetual. The fact that screens do exist whereby electrical and magnetic action can be cut off would seem to open a door for the perpetual-motion seeker. Unfortunately, and rightly so, the present writer believes that these screens involves in all cases that gain or loss of work which is demanded by the law of the conservation of energy. A shoemaker of Linlithgow called Spence pretended that he had found a black substance which intercepted magnetic attraction and, when he produced two machines which were moved, as he asserted, by the agency of permanent magnets, thanks to the black substance. The fraud was speedily exposed, but it is worthy of remark that Sir David Brewster thought that its inventor had been given to the "Annales de chimie" (1818), wherein he states that Mr Playfair and Captain Kater have inspected both of these machines and are satisfied that they resolve the problem of perpetual motion.

The present writer has sent an elaborate draft of a locomotive engine which was to be worked by the agency of permanent magnets. He forgets the details, but it was not so simple as the plan represented in fig. 4, where I have shown the permanent magnet and the attraction is "screened" by the wooden blocks A and B from the upper left and lower right quadrants of the soft iron vessels M and N. It is, therefore, in a round in the same direction by both M and N, and thus goes on for ever.

One more page from this chapter of the "booming" of perpetual motion; the author is famous Jean Bernoulli the elder. We translate his Latin, as far as possible, into modern phraseology. In the first place there is the following fig. (1) If there be two fluids of different densities whose densities are in the ratio of G to L, the height of equiponderating cylinders on equal bases will be the inverse of the ratio (2) Accordingly, if the height AC of one fluid, contained in the vase AD, be in the ratio to the height EF of the other liquid, which is in a tube open at both ends; the mixture of that liquid will remain at rest. (3) Wherefore, if AC be the greater ratio than L to G, the liquid in the tube will ascend; or if the tube be sufficiently long the liquid will flow at the orifice E (this follows from hydrostatic principles). (4) It is possible to have two liquids of different density that will mix. (5) It is possible to have a filter, colander, or other separator, by means of which the lighter liquid mixed with the heavier may be separated again therefrom.

Construction.—These things being presupposed (says Bernoulli), I thus construct a perpetual motion. Let there be taken in any (if you please, in equal) quantities two liquids of different densities mixed together (which may be had by hyp. 4.); and let the density of the heavier be first determined, and be the heavier to the lighter as G to L, then with the mixture let the vase AD be filled up to A. Then let the lighter liquid be at both ends, be taken of such a length that AC:EF=2L:G+L; but the orifice F of this tube be stopped, or rather covered with the filter of the material separating the lighter liquid from the heavier (which may also be had by hyp. 5.) now let the tube thus provided be turned over to the vessel CD; I say that the liquid will continually ascend through the orifice F of the tube and overflow by the orifice E into the vessel below.

Demonstration.—Because the orifice F of the tube is covered by the filter (by constricting which) separates the lighter liquid from the heavier, it follows that, if the tube be turned over to the vessel, the lighter liquid alone which is mixed with the heavier ought to rise through the filter into the tube, and that, too, higher than the surface of the surrounding liquid (by hyp. 2.); so that AC:EF=2L:G+L; by which it necessarily follows (by hyp. 3.) that the lighter liquid will flow over by the orifice E into the vessel below, and there will meet the heavier and be again mixed with it; and it will then penetrate the filter, again ascend the tube, and be a second time driven through the upper orifice. Thus, therefore, will the flow be continued for ever.—Q.E.D.

Bernoulli then proceeds to apply this theory to explain the perpetual rise of water to the mountains, and its flow in rivers to the sea, which others had falsely attributed to capillary action—his idea being that it was an effect of the different densities of salt and fresh water.

One really is at a loss with Bernoulli's wonderful theory, whether to admire most the conscientious statement of the hypothesis, the prim logic of the demonstration, so carefully cut according to the pattern of the ancients, or the weighty structure built on so frail a foundation. Most of our perpetual motions were clearly too little known; surely this one was one of too much.

(2. Gan.)

PERPETUITY (Lat. perpetuus, continuous), the state of being perpetual or continuing for an indefinite time; in law the tying-up of an estate for a lengthened period, for the purpose of preventing alienation. It is being opposed to the interest of the state and individual effort, the notion of perpetuity has been considerably curtailed, and the rule against perpetuities in the United Kingdom now forbids the making of an executory interest unless beginning within the period of any fixed number of existing lives and an additional period of twenty-one years (with a few months added, if necessary, for the period of gestation). The rule applies to dispositions of personal property (see ACCUMULATION) as well as of real property. There are certain exceptions to the rule, as in the case of limitations in mortmain and to charitable uses, and also in the case of a perpetuity created by act of parliament (e.g. the estate of Blenheim, settled on the duke of Marlborough, and Strathfieldsaye on the duke of Wellington). In the United States the English common-law rule against perpetuities obtains in many of the states; in others it has been replaced or reinforced by statutory rules (see Gray on Alienation, § 42). Charities may be established in perpetuity, and provisions may be made for an accumulation of the funds for a reasonable time, e.g. for 100 years (Woodruff v. Marsh, 63 Conn. Rep. 125; 38 Amer. St. Rep. 346). The general tendency of American legislation is to favour tying up estates to a greater extent than was formerly approved.

PERPIGNAN, a town of south-western France, capital of the department of Pyrénées-Orientales, on the right bank of the Têt, 7 m. from the Mediterranean and 42 m. S. by W. of Narbonne by rail. Pop. (1906), town, 32,683; commune, 38,888. The north-west quarter of the town is traversed by the Basse, a tributary of the Têt, while to the south it is overlooked by a citadel enclosing a castle (13th century) of the kings of Majorca. The chapel is remarkable as being a mixture of the Romanesque, Pointed and Moorish styles. The ramparts surrounding the town are 13 ft. thick and 17 ft. high. The work was begun by Charles V. and Vauban. The sculptures and caryatides still to be seen on the gateway of the citadel were placed there by the dukes of Alava. The cathedral of St Jean was begun in 1324 and finished in 1509. The most noteworthy feature in the building is an immense reredos of white marble (early 17th century) by Bartholomew Soler of Barcelona.

In the north of the town commanding the gateway of Notre-Dame (1451) there stands a curious machicolated stronghold known as the Castillet (14th and 15th centuries), now used as a prison. The buildings of the old university (18th century) contain the library and the museum, the latter possessing the first photographic proofs executed by Daguerre and a collection of sculptures and paintings. Statues of François Arago, the astronomer, and Hyacinthe Rigaud, the painter, stand in the squares named after them.

Perpignan is a fortified place of the first class, and seat of a prefect, a bishop and a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce, a branch of the Bank of France, a communal college for boys, a school of music and training colleges for both sexes. The higher tribunal of Andovici sits at Perpignan. Trade is in wine, iron, wool, oil, cork and leather.

Perpignan dates at least from the 10th century. In the 11th and 12th centuries it was a capital of the counts of Roussillon, from whom it passed in 1172 to the kings of Aragon. Philip the Bold, king of France, died there in 1285, as he was returning from an unsuccessful expedition into Aragon. At that time it belonged to the kingdom of Majorca, and its sovereigns resided there until, in 1344, that small state reverted to the possession of the
kings of Aragon, who in 1349 founded a university at Perpignan. When Louis XI. occupied Roussillon as security for money advanced by him to the king of Aragon, Perpignan resisted the French arms for a considerable time, and only yielded through stress of famine (March 15, 1475). Roussillon was restored to Aragon by Charles VIII. and Perpignan was again besieged in 1542 under Francis I., but without success. Later on, however, the inhabitants, angered by the tyranny and cruelty of the Spanish governor, surrendered the town to Louis XIII. The citadel held out until the 9th of September 1642, and the place has ever since belonged to France, to which it was formally ceded by the treaty of the Pyrenees (1659). In 1662 the bishopric of Elne was transferred to Perpignan.

See P. Vidal, Perpignan depuis les origines jusqu'à nos jours (Paris, 1868).

PERQUISIT (Lat. perquisitum, that which has been acquired by careful search; perquirere, to search diligently), a term properly used of the profits which accrue to the holder of an office over and above the regular emoluments; also, in law, the casual profits, such as accrue by heriots, fines, reliefs, &c., to a lord of a manor above the yearly revenue from the copyholds. The word is used generally of the casual profits allowed by custom to servants or other employes from superfluous articles which the employer has enjoyed the use of or which are supposed not to be needed.

PERRAULT, CHARLES (1628-1703), French author, was born in Paris on the 12th of January 1628. His father, Pierre Perrault, was a barrister, all of whose four sons were men of some distinction: Claude (1613-1688), the second, was by profession a physician, but became the architect of the Louvre, and translated Vitruvius (1673). Charles was brought up at the Collège de Beauvais, until he chose to quarrel with his masters, after which he was allowed to follow his own bent in the way of study. He took his degree of licencié en droit at Orleans in 1651, and was almost immediately called to the Paris bar, where, however, he practised for a very short time. In 1654 his brother became receiver-general of Paris, and made Charles his clerk. After nearly ten years of this employment he was, in 1663, chosen by Colbert as his secretary to assist him in matters relating to the arts and sciences, not forgetting literature. He was controller-general of the department of public works, member of the commission that afterwards developed into the Académie des inscriptions, and in 1671 he was admitted to the Académie française. Perrault justified his election in several ways. One was the orderly arrangement of the business affairs of the Academy, another was the suggestion of the custom of holding public séances for the election of candidates. Colbert's death in 1683 put an end to Perrault's official career, and he then gave himself up to literature, beginning with Saint Paulin évêque de Nole, avec une épître chrétienne sur la pénétration, et une ode aux nouveaux convertis. The famous dispute of the ancients and moderns arose from a poem on the Siècle de Louis le Grand (1687), read before the Academy by Perrault, on which Boileau commented in violent terms. Perrault had ideas and a will of his own, and he published (4 vols., 1688-1690) his Parallèle des anciens et des moderns. The controversy that followed in its track enraged hotly in France, passed thence to England, and in the days of Antoine Houdart de la Motte and Fénelon broke out again in the country of its origin. As far as Perrault is concerned he was inferior to his adversaries in learning, but decidedly superior to them in wit and politeness.

It is not known what drew Perrault to the composition of the only works of his which are still read, but the taste for fairy stories and Oriental tales at court is noticed by Mme de Sevigné in 1676, and at the end of the 17th century gave rise to the fairy stories of Mlle L'Héritier de Villaudon, whose Bigartures ingénieuses appeared in 1690, of Mme d'Aulnoy and others, while Antoine Galland's translation of the Thousand-and-One Nights belongs to the early years of the 18th century. The first of Perrault's contes, Grisélidis, which is in verse, appeared in 1661, and was reprinted with Peau d'âne and Les Souhaits ridicules, also in verse, in a Recueil de pièces curieuses—published at the Hague in 1694. But Perrault was no poet, and the merit of these pieces is entirely obscured by that of the prose tales, La Belle au bois dormant, Petit chaperon rouge, La Barbe bleue, Le Chat botté, Les Fées, Cendrillion, Riquet à la houppe and Le Petit poucet, which appeared in a volume with 1697 on the title-page, and with the general title of Histoires ou contes du temps passé avec des moralités. The frontispiece contained a placard with the inscription, Contes de ma mère l'oie. In 1786 Paul Lacroix attributed the stories to the authorship of Perrault's son, P. Darmancour, who signed the dedication, and was then, according to Lacroix, nineteen years old. Andrew Lang has suggested that the son was a child, not a young man of nineteen, that he really wrote down the stories as he heard them, and that they were then edited by his father. This supposition would explain the mixture of naïveté and satire in the text. Perrault's other works include his Mémoires (in which he was assisted by his brother Claude), giving much valuable information on Colbert's ministry; an Entête travestie written in collaboration with his two brothers, and Les Hommes illustres qui ont paru en France pendant ce siècle (2 vols., 1669-1700). He died on the 10th of May 1703, in Paris. His son, Perrant d'Arma-Court, was the author of a well-known book, Contes des fées, containing the story of Cinderella, &c.

Except the tales, Perrault's works have not recently been reprinted. Of these there are many modern editions, e.g. by Paul Lacroix (1876), and by A. Levêbre ("Nouvelle collection Janett," 1875); also Perrault's Popular Tales (Oxford, 1888), which contains the French text edited by Andrew Lang, with an introduction, and an examination of the sources of each story. See also Hippolyte Rigault, Hist. de la querelle des anciens et des modernes (1856).

PERRERS (or DE WINDSOR), ALICE (d. 1400), mistress of the English king Edward III., belonged probably to the Hertfordshire family of Perrers, although it is also stated that she was of more humble birth. Before 1366 she had entered the service of Edward's queen, Philippa, and she appears later as the wife of Sir William de Windsor, deputy of Ireland (d. 1384). Her intimacy with the king began about 1366, and during the next few years she received from him several grants of land and gifts of jewels. Not content with the great influence which she obtained over Edward, Alice interfered in the proceedings of the courts of law in favour of her friends, or of those who had purchased her favour: actions which induced the parliament of 1376 to forbid all women from practising in the law courts. Alice was banished, but John of Gaunt, duke of Lancaster, allowed her to return to court after the death of Edward the Black Prince in June 1376, and the parliament of 1377 reversed the sentence against her. Again attempting to pervert the course of justice, she was tried by the peers and banished after the death of Edward III. in June 1377; but this sentence was annulled two years later, and Alice regained some influence at court. Her time, however, was mainly spent in lawsuits, one being with William of Wykeham, bishop of Winchester, and another with her dead husband's nephew and heir, John de Windsor.

PERRON, PIERRE CUILIER (1755-1834), French military adventurer in India, whose name was originally Pierre Cuiller, was born in 1755 at Château du Loire in France, the son of a cloth merchant. In 1772 he went out to India as a sailor on a French frigate, despatched on the Malabar coast, and made his way to upper India, where he enlisted in the rana of Gohad's corps under a Scotsman named Sangster. In 1790 he took service under De Boigne, and was appointed to the command of his second brigade. In 1795 he assisted to win the battle of Kardala against the nizam of Hyderabad, and on De Boigne's retirement became commander-in-chief of Sindhia's army. At the battle of Malpura (1800) he defeated the Rajput forces. After the defeat of Ujjain (1801) he refused to send his troops to the aid of Sindhia. His treachery on this occasion shook his position, and on the outbreak of war between Sindhia and the British in 1803 Perron was superseded and fled to the British camp. In the battles of Delhi, Laswari and Assaye, Perron's battalions were completely destroyed by Lord Lake and
Sir Arthur Wellesley. He returned to France with a large fortune, and died in 1834.

See H. Compton, European Military Adventurers of Hindustan (1892).

PERRON (a French word meaning properly a "large stone," Ital. petra, from Lat. petra, Fr. pierre, stone), in architecture, a term applied to a raised platform reached by steps in front of the entrance to a building. The grand flight of external steps entering the mansions of the medieval nobility or high officials was considered in itself a mark of jurisdiction, as it is said that sentence was there pronounced against criminals, who were afterwards executed at the foot of the steps—i.e., at the Giant's Stairs of the Doge's palace at Venice.

PERRONE, GIOVANNI (1794-1876). Italian theologian, was born at Chieri (Piedmont) in 1794. He studied theology at the University of Turin, and in his twenty-first year went to Rome, where he joined the Society of Jesus. In 1816 he was sent as professor of theology to Orvieto, and in 1823 appointed to a similar post in the Collegium Romanum. From Ferrara, where he was rector of the Jesuit College after 1820, he returned to his teaching work in Rome, being made head of his old college in 1850. He took a leading part in the discussions which led up to the promulgation of the dogma of the Immaculate Conception (1854), and in 1869 was prominent on the Ultramontane side in the Vatican Council. His numerous dogmatic works are characteristic of orthodox modern Roman theology. They include Praelectiones theologicae (9 vols., Rome, 1835 sqq.), Praelectiones theologicae in compendium redactae (4 vols., Rome, 1845), II Hermesianum (Rome, 1838), II Protestantismus e la regula di fede (3 vols., 1853), De divinitate D. N. Jesu Christi (3 vols., Turin, 1870). He died on the 26th of August 1876.

PERROT, SIR JOHN (c. 1537-1592), lord deputy of Ireland, was the son of Mary Berky, who afterwards married Thomas Perrot, a Pembroke-shire gentleman. He was generally reputed to have been descended from Henry VIII, and as his father, William Paulet, 1st marquis of Winchester. He was in this way brought to the notice of Henry VIII, who died, however, before fulfilling his promises of advancement, but Perrot was knighted at the coronation of Edward VI. During Mary's reign he suffered a short imprisonment on the charge of harbouring his uncle, Robert Perrot, and other heretics. In spite of his Protestantism he received the castle and lordship of Carew in Pembroke-shire, and at the beginning of Elizabeth's reign he was entrusted with the naval defence of South Wales. In 1570 Perrot reluctantly accepted the newly created post of lord president of Munster. He landed at Waterford in February of the next year, and energetically set about the reduction of the province. In the course of two years he hunted down James Fitzmaurice Fitzgerald, whose submission he received in 1572. Perrot resented the reinstatement of Gerald Fitzgerald, 13th earl of Desmond, and after vainly seeking his own recall left Ireland without leave in July, 1573, and protesting himself at court was allowed to resign his office, in which he was succeeded by Sir William Drury. He returned to his Welsh home, where he was fully occupied with his duties as vice-admiral of the Welsh seas and a member of the council of the marches. Although in 1578 he was accused by the deputy-admiral, Richard Vaughan, of tyranny, subversion of justice and of dealings with the pirates, he evidently retained the royal confidence, for he was made commissioner for piracy in Pembroke-shire in 1578, and in the next year was put in command of a squadron charged to intercept Spanish ships on the Irish coast.

The recall of Arthur Grey, Lord Grey de Wilton, in 1582, left vacant the office of lord deputy of Ireland, and Perrot was appointed to it early in 1584. Sir John Norris became lord president of Munster and Sir Richard Bingham went to Connacht. Perrot's chief instructions concerned the plantation of Munster, where the confiscated estates, too 600,000 acres in extent, of the earl of Desmond were to be given to English landlords at a nominal rent, provided that they brought with them English farmers and labourers. Before he had had time to embark on this enterprise he heard that the Highland clans of Maclean and MacDonnell were raiding Ulster at the invitation of Sorley Boy MacDonnell, the Scoto-Irish constable of Dunluce Castle. He marched into Ulster, but Sorley Boy escaped him, and crossed to Scotland, only to return later with reinforcements. The lord deputy was roundly abused by Elizabeth for undertaking a "rash, unadvised journey," but Sorley Boy was reduced to submission in 1586. In 1585 Perrot succeeded in completing the "composition of Connought," a scheme for a contract between Elizabeth and the landholders of the province by which the queen should receive a small quitrent. During his career as lord deputy he had established peace, and had deserved well of Elizabeth. But a rash and violent temper, coupled with unspiring criticism, not to say abuse, of his associates, had made him numerous enemies. A hastily conceived plan for the conversion of the revenues of St Patrick's Cathedral, Dublin, to provide funds for the erection of two colleges, led to a violent quarrel with Adam Loftus, archbishop of Armagh. Perrot had, in a former session, instigated an act of parliament to give the interests of Connought, and in May 1587 he actually struck Sir Nicholas Bagenal, the knight marshal, in the council chamber. Elizabeth decided to supersede him in January 1588, but it was only six months later that his successor, Sir William Fitzwilliam, arrived in Dublin. After his return to England his enemies continued to work for his ruin, and a forged letter purporting to be from him to Philip II of Spain gave colour to an accusation of treasonable correspondence with the queen's enemies, but when he was tried before a special commission in 1592 the charge of high treason was chiefly based on his alleged contemptuous remarks about Elizabeth. He was found guilty, but died in the Tower in September 1592. Elizabeth was said to have intended his pardon.

A life of Sir John Perrot from a MS. dating from the end of Elizabeth's reign was printed in 1728. Sir James Perrot (1571-1637), writer and politician, was his illegitimate son.

PERRY, MATTHEW CALBRAITH (1794-1858), American naval officer, was born in South Kingston, Rhode Island, on the 10th of April 1814. He became a midshipman in 1809, and served successively in the schooner "Revenge" (then commanded by his brother, Oliver H. Perry) and the frigate "President." In 1813 he became a lieutenant, and during the War of 1812 served in the frigate "United States" (which, when abandoned by Perry, was blockaded in the harbour of New London, Connecticut), the "President" and the "Chippewa." Soon after the war Perry was assigned to the Brooklyn (New York) navy yard, where he served till 1819. He became a commander in 1826, and during 1826-1830 was in the recruiting service at Boston, where he took a leading part in organizing the first naval apprentice system of the United States navy. He was promoted in 1837 to the rank of captain (then the highest actual rank in the United States navy), and in 1839-1840 commanded the "Fulton II," the first American steam war vessel. He also planned the "Missouri" and the "Mississippi," the first steam frigates of the United States navy, and was in command of the Brooklyn navy yard from June 1841 until March 1843, when he assumed command of a squadron sent to the African coast by the United States, under the Webster-Ashburton treaty, to aid in suppressing the slave trade. This command of a squadron entitled him to the honorary rank of commodore. On the 23rd of October 1846, during the Mexican War, Perry, in command of the steam vessels "Vixen" and "McLane," and four schooners, attacked and captured Frontera, at the mouth of the Tobasco river, then pushed up on the river and (on the 24th) captured the town of Tobasco, thereby cutting off Mexico from Yucatan. He relieved Commodore David Conner at Vera Cruz on the 21st of March 1847, and after a two days' bombardment by a battery landed from the ships the city wall was breached sufficiently to admit the entrance of troops.

Commodore Perry's distinctive achievement, however, was his negotiation in 1854 of the treaty between the United States and Japan, which opened Japan to the influences of western civilization. Perry sailed from Norfolk, Virginia, on the 24th of November 1852, in the "Mississippi." He reached Hong-Kong...
of the 7th of April and on the 8th of July dropped anchor off the city of Urage, on the western shore of the Bay of Yedo with the "Susquehanna," his flagship, the "Mississippi," and the sloops-of-war "Saratoga" and "Plymouth." On the 14th of July, accompanied by his officers and escorted by a body of armed marines and sailors (in all about 300 men), he went ashore and presented to commissioners especially appointed by the shogun to receive them, President Fillmore's letters to the emperor, and his own credentials. A few days later the American fleet sailed for Hong-Kong with the understanding that Perry would return in the following spring to receive the emperor's reply. On the 11th of February, accordingly, he reappeared in the Bay of Yedo with his fleet — this time composed of the "Susquehanna," "Powhatan," and "Mississippi," and the sailing vessels "Vandalia," "Lexington" and "Southampton," and despite the protests of the Japanese selected an anchorage about 12 m. farther up the bay, nearly opposite the present site of Yokohama, and within about 10 m. of Yedo (Tokyo). Here, on the 31st of March 1854, was concluded the first treaty (ratified at Simoda, on the 21st of February 1855, and proclaimed on the 22nd of June following) between the United States and Japan. The more important articles. The treaty provides for this trade to be carried on by Japanese companies authorized to purchase, by a joint venture, vessels of the United States, the port of Hakodate, in the principality of Matsmai, were constituted ports for the reception of American ships, where they could buy such supplies as they needed; that Japanese vessels should assist American vessels driven ashore on the coasts of Japan, and that the crews of such vessels should be properly cared for at one of the two treaty ports; that shipwrecked and other American citizens in Japan should be as free as in other countries, within certain prescribed limits; that ships of the United States should be permitted to trade at the two treaty ports under temporary regulations prescribed by the Japanese, that American ships should use only the ports named, except under stress of weather, and that privileges granted to other nations thereof must also be extended to the United States. Commodore Perry died in New York City on the 4th of March 1858.

PERRY, OLIVER HAZARD (1785-1819), American naval officer, was born at South Kingston, Rhode Island, on the 23rd of August 1858. He entered the navy as midshipman (1799) with his father, Christopher Raymond Perry (1761-1818), a captain in the navy, and saw service against the Barbary pirates. At the beginning of the War of 1812 he was in command of a flotilla at Newport, but was transferred (Feb. 1813) to the Lakes. He served with Commodore Chauncey, and then was sent from Lake Ontario to Lake Erie, where he took up the chief command at the end of March 1813. With the help of a strong detachment of officers and men from the Atlantic coast he equipped a squadron consisting of one brig, six frigates, and one vessel of the class of the "Constitution" at Presque Isle (now Erie), where he concentrated the Lake Erie fleet in July. When Captain Perry appeared off Amherstburg, where Captain Robert Heriot Barclay (d. 1837), the British commander, was lying with his squadron, he had a very marked superiority. Captain Barclay, after a hot engagement—the Battle of Lake Erie—in which Captain Perry's flagship the "Lawrence," a brig, was so severely shattered that he had to leave her, was completely defeated. Perry commanded the "Java" in the Mediterranean expedition of 1815-1816, and he died at Port of Spain in Trinidad on the 23rd of August 1819, of yellow fever contracted on the coast of Brazil.

occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at Nakshi Rustam is expressly declared in its inscription to be the tomb of Darius Hystaspis, concerning whom Ctesias relates that his grave was in the face of a rock, and could only be reached by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persians kings, either that their remains were brought "to the Persians," or that they died there. Now we know that Cyrus was buried at Pasargadae (q.v.) and if there is any truth in the statement that the body of Cambyses was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at Nakshi Rustam are probably, besides Darius, Xerxes I., Artaxerxes I. and Darius II. Xerxes II., who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sogdianus (Seyyedun). The two completed graves behind Takhti Jamshid would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Arsies, who reigned at the longest two years, or, if not his, then that of Darius III. (Codomannus), who is one of those whose bodies are said to have been buried at Persepolis in the inscription, fig. 6d. Another small group of ruins in the same style is found in the village of Hajjlabad, on the Pulwar, a good hour's walk above Takhti Jamshid. These formed a single building, which was still intact 900 years ago, and was used as the mosque of the then existing city of Istakhr.

Since Cyrus was buried in Pasargadae, which moreover is mentioned in Ctesias as his own city, and since, to judge from the inscriptions, the buildings of Persepolis commenced with Darius I., it was probably under this king, with whom the sycamore passed to a new branch of the royal house, that Persepolis became the capital (see Persia: Ancient History, V. 2) of Persia proper. As a residence, however, for the rulers of the empire, a remote place in a difficult alpine region was far from convenient, and the real capitals were Susa, Babylon and Ecbatana. This accounts for the fact that the Greeks were not acquainted with the city until it was taken and plundered by Alexander the Great. Ctesias must certainly have known of it, and it is possible that he may have named it simply Hêpoas, after the people, as is undoubtedly done by certain writers of a somewhat later date, and after they had been expelled from Persia. The name of the people and the country is another question. It is extremely hazardous to assume, with Sir H. Rawlinson and J. Oppert, that the words and Pārsa, "in this Persia," which occur in an inscription on the gateway built by Xerxes (D. l. 14), signify "in this city of Pārsa," and consequently prove that the name of the city is identical with the name of the country. The form Persepolis (with a play on παρασ, destruction) appears first in Cleitarchus, one of the earliest, but unfortunately one of the most imaginative annalists of the exploits of Alexander.

It has been universally admitted that "the palaces" or "the palace" (τά Βασίλεια) burned down by Alexander are those now in ruins at Takhti Jamshid. From Stolze's investigations it appears that at least one of these, the castle built by Xerxes, leaves evident traces of having been destroyed by fire. The locality described by Diodorus after Cleitarchus corresponds in important particulars with Takhti Jamshid, for example, in being supported by the

1 This statement is not made in Ctesias (or rather in the extracts of Photius) about Darius II., which is probably accidental; in the case of Sogdianus, who as a usurper was not deemed worthy of honorable burial, there is a good reason for the omission.

2 Arrian. 22

3 Cf. also in particular Plutarch, Aris., iii., where Pasargadae is distinctly looked on as the sacred dradle of the dynasty.

4 The story of Aelian (H. A. l. 59), who makes Cyrus build his royal palace in Persepolis, deserves no attention.

5 So Arrian (l. i. 18, 1. 10), or rather his best authority, King Ptolemey. So, again, the Babylonian Berosus, shortly after Alexander. See Clemens Alex., Admon. ad gentes, c. 5, where, with Georg Hoffmann (Pers. Martyr., 137), παρασ is to be inserted before ἡποας, and this to be understood as the name of the metropolis.

mountain on the east. There is, however, one formidable difficulty. Diodorus says that the rock at the back of the palace containing the royal sepulchres is so steep that the bodies could be raised to their last resting-place only by mechanical appliances. This is not true of the graves behind Takhti Jamshid, to which, as F. Stolze expressly observes, one can easily ride up; on the other hand, it is strictly true of the graves at Nakshi Rustam. Stolze accordingly started the theory that the royal castle of Persepolis stood close by Nakshi Rustam, and has sunk in course of time to shapeless heaps of earth, under which the remains may be concealed. The vast ruins, however, of Takhti Jamshid, and the terrace constructed with so much labour, can hardly be anything else than the ruins of palaces; as for temples, the Persians had no such thing, at least in the time of Darius and Xerxes. Moreover, Persian tradition at a very remote period knew of only three architectural wonders in that region, which it attributed to the fabulous queen Humāi (Khumāi)—the grave of Cyrus at Murgab, the building at Hājjābād, and those on the great terrace. It is safest therefore to identify these last with the royal palaces destroyed by Alexander. Cleitarchus, who can scarcely have visited the place himself, with his usual recklessness of statement, confounded the tombs behind the palaces with those of Nakshi Rustam; indeed he appears to imagine that the royal sepulchres were at the same place. This will make Persepolis (probably a Persian name) a province of the great Macedonian Empire (see Diod. xii. 11. sec. 46; probably after Hieronymus of Cardia, who was living about 310). The city must have gradually declined in the course of time; but the ruins of the Achae-menidae remained as a witness to its ancient glory. It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About A.D. 200 we find there the city Istakhr (properly Stakhr) as the seat of the local governors. There the foundations of the second great Persian Empire were laid, and Istakhr acquired special importance as the centre of priestly wisdom and orthodoxy. The Sassanian kings have covered the face of the rocks in this neighbourhood, and in part even the Achaemenian ruins, with their sculptures and inscriptions, and must themselves have built largely here, although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis — and this in spite of the fact that for four hundred years the Sassanians maintained relations, friendly or hostile, with the empire.

At the time of the Arabian conquest Istakhr offered a desperate resistance, but the city was still a place of considerable importance in the 1st century of Islam (see Caliphate), although its greatness was speedily eclipsed by the new metropolis Shiraz. In the 10th century Istakhr had become an utterly insignificant place, as may be seen from the descriptions of Istakhr, a native (c. 950), and of Mukaddasi (c. 985). During the following centuries Istakhr gradually declines, until, as a city, it ceased to exist. This fruitful region, however, was covered with villages till the frightful devastations of the 15th century; and even now it is, comparatively speaking, well cultivated. The "castle of Istakhr" played a conspicuous part several times during the Moughmedan period as a strong fortress. It was the middlemost and the highest of the three steep crags which rise from the valley of the Kur, at some distance to the west or north-west of Nakshi Rustam. We learn from Oriental writers that one of the Buyid (Buwañid) sultans in the 10th century of the Flight constructed the great cisterns, which may yet be seen, and have been visited, amongst others, by James Morier and E. Flandin. W. Ouseley points out that this castle was still in use in the 16th century, at least as a state prison. But when Pietro della Valle was there in 1621 it was already in ruins.

6 The name of this mountain too, Μαρσαλάκας, is identical with Shākhak, which is at least tolerably well established by W. Ouseley (l. ii. 417) as a synonym of Kūh Ra mắt.

7 See especially Hama z. 18, 38; 'Tabari, i. 690, 816 (cf. T. Nöldeke, Geschichte der Perser . . . aus. . . 'Tabari, p. 8). The ruins at Takhti Jamshid are alluded to as the work of Humāi, in connexion with an event which occurred shortly after A.D. 200.
PERSEUS-PERSIA 187

PERSEUS, in Greek legend, son of Danaë and Zeus. When Perseus was grown to manhood Polydectes, king of Seriphus, cast his eye on Danaë; and, in order to rid himself of the son, exacted of him a promise that he would bring him the head of the Gorgon Medusa. The Gorgons dwelt with their sisters the Graeae (the grey women) by the great ocean, far away in the west. Guided by Hermes and Athena, Perseus came to the Graeae. They were three hags, with but one eye and one tooth between them. Perseus stole the eye and the tooth, and would not restore them till the Graeae had guided him to the Nymphs, from whom he received the winged sandals, a wallet (ēidōros, resembling a gamekeeper's bag) and the helmet of Hades, which rendered him invisible. Thus equipped and armed by Hermes with a sharp sword like a sickle, he came upon the Gorgons as they slept, and cut off Medusa's head, while with averted eyes he looked at her reflection which Athena showed him in the mirror of her shield. Perseus put the Gorgon's head in his wallet and fled, pursued by Medusa's sisters, to Ethiopia, where he delivered and married Andromeda (q.v.). With her he returned to Seriphus in time to rescue his mother and Dictys from Polydectes, whom he turned to stone with all his court by showing them the Gorgon's head. The island itself was turned to stone, and the very frogs of Seriphus (so ran the proverb) were dumb (Aelian, Nat. anim. iii. 37). Perseus then gave the head of Medusa to Athena, and, with Danaë and Andromeda, hastened to Argos to see his grandfather, Acrisius, once more. But before his arrival Acrisius, fearing the oracle, had fled to Larissa in Thessaly. Thither Perseus followed him, and at some funeral games held in honour of the king of that country unawares discovered his grandfather by the throw of a quoit, which struck him on the foot. Ashamed to return to Argos, Perseus gave his kingdom to Megapentes (Acrisius's nephew), and received from him Tyrins in exchange. There he reigned and founded Midea and Mycenae, and became the ancestor of the Persids, amongst whom were Eurytheus and Heracles.

The legend of Perseus was localized in various places. Italy claimed that the chest containing Danaë and Perseus drifted ashore on the Italian coast (Virgil, Aen. vii. 372, 410). The Persian kings were said to have been descended from Perseus a son of Perseus, and, according to Pausanias of Damascus, he taught the Persians to worship fire, and founded the Magian priesthood. His cult was transferred to the kings of Pontus, for on coins of Amisus he is represented with the features of Mithradates Eupator. Like Andromeda, Hesione, the daughter of Laomedon, king of Troy, was rescued by Heracles from a sea-monster, and both stories have been interpreted of the sun, slaying the darkness. Andromeda and Hesione being the moon, which the darkness is about to devour. In one version of the story of Hesione, Hesione is said to have spent three days, like Jonah, in the belly of the beast, and it is noteworthy that the Greek representations of Andromeda's monster were the models for Jonah's fish in early Christian art. Its bones and Andromeda's chains were shown on a rock at Joppa. Perseus appears on coins of Pontus and Cappadocia, and of Tarsus in Cilicia, which he was said to have founded. The legend of St George was influenced by the traditions current regarding Perseus in Syria and Asia Minor.

For the slaying of the Medusa, see F. H. Knapps, Quomodo Perseus fabulam artifices graeci et romani tractaverint (1893); and, on the whole story, E. S. Hartland, The Legend of Perseus (1894-1896).  

PERSEUS, in astronomy, a constellation of the northern hemisphere, called after the Greek legendary hero. It is mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.).

Author of a history of Antioch; he is quoted by John Malalas, Chronographia, pp. 37-38, ed. Bonn (1831). Nothing further is known of him (see C. W. Müller, Fragmenta historiorum graecorum, iv. 467).

Ptolemy and Tycho Brahe catalogued 29 stars, Hevelius 46. The most important member of this constellation is β Persei or Algol (q.v.), a famous variable star. ω Persei is a triple star, composed of one 4th magnitude star and two of the 10th magnitude; η Persei is an irregular variable, with a range in magnitude of 3.4 to 4.1. Nova Persei is a "new" star discovered in 1887; and subsequently recognized on Harvard plates by Mrs Fleming in 1895; another new star was discovered by Anderson on the 21st of February 1901, which, after increasing in magnitude, gradually became fainter and ultimately disappeared. There is a nebula surrounding Nova Persei (1901) which was photographed at Yerkes observatory in September 1901; a pair of star clusters, appearing as a bright patch in the Milky Way; and the meteoric swarm named the Perseids, which appear in August and have their radiant in Perseus. (See Meteor.)

PERSEUS OF MACEDONIA (b.c. 212 B.C.), the last king of Macedon, eldest son of Philip V. He had his brother Demetrius killed, and thus cleared his way to the throne in 179. War broke out with Rome in 171 B.C. when P. Licinius Crassus was sent to attack him. Perseus defeated Crassus at Callinicus in Thessaly, but in 168 he was annihilated at Pydna by L. Aemilius Paulus. He was led in triumph through Rome, and died in captivity at Alba Fucens. (See Macedonia.)

PERSHORE, a market town in the Evesham parliamentary division of Worcestershire, England, 113 m. W.N.W. of London and 7 S.E. of Worcester by the Great Western railway. Pop. (1901), 3348. The station is 1 1/2 m. from the town. Market gardening and fruit-growing (especially plums) are carried on and agricultural implements are manufactured. The churches of the two parishes of Holy Cross and St Andrew face one another across a road. Holy Cross is a remnant of a mitred abbey of Benedictines, said to have been founded about 970 by King Edgar, on the site of a Mercian religious settlement. There remain only the fine Early English choir, with Decorated additions, the Norman tower, and the medieval Decorated tower; while slight fragments of a Norman nave are seen.

PERSIA, a kingdom of western Asia, bounded on the N. by the Caspian Sea and the Russian Transcaucasian and Trans- caspian territories, on the E. by Afghanistan and Baluchistan, on the S. by the Arabian Sea and the Persian Gulf, and on the W. by Turkish territory. Long before the Christian era the satrapies of Darius comprehended roughly an immense range of territory, from the Mediterranean to the Indus and from the Caucasian chain and Jaxartes to the Persian Gulf and Arabian Ocean. In the 17th and 18th centuries A.D. the conquests of ' Abbas and Nadir kept up these boundaries more or less on the east, but failed to secure them on the west, and were limited to the Caucasus and Oxus on the north. Persia of the present day is not only, in the matter of geographical definition, far from the vast empire of Sacred Writ and remote history, but it is not even the less extensive dominion of the Safawi kings and Nadir Shah. It may be said, however, to comprise now quite as much settled and consolidated territory as at any period of its political existence of which we can speak with authority.

Boundaries.—The region of Ararat presents a good starting point for the definition of the western and northern frontiers of Persia. A line 20 m. in length from a point on the river Aras, in 39° 45' N. and 44° 40' E. to Mt Ararat, in the south-westly direction, divides Persia from Russia. Southwards from Mt Ararat the Perso-Turkish frontier extends about 700 m. to the mouth of the Shatt el Arab in the Persian Gulf in 36° N. and 48° 40' E., but is undefined with the exception of the western boundary of the little district of Kotur. A mixed commission was appointed in 1843 for the settlement of the Perso-Turkish frontier. The labours of this commission resulted in the Edwards treaty of 1847, by which both powers abandoned some lands and agreed to appoint commissioners to define the frontier. The commissioners met in 1849, 1850 and 1851 at Bagdad and Muhamarah without arriving at any result. In 1851 Lord Palmerston proposed that the general line of frontier should be traced by the agents of Turkey and Persia at Constantinople, assisted by the
PERSIA

Commissioners, in conformity with the treaty of Erzerum, leaving doubtful localities to be settled in future. The Russian government agreed to this proposal, and the work of surveying the country from Mt Ararat to the Persian Gulf was then undertaken. When this was done the preparation of a map, embracing territory 700 m. in length by 20 to 40 m. broad, was

unsettled, and disputes have frequently arisen between the Turkish and Persian governments with regard to their respective claims to land (Hertslet, Persian Treaties). In the autumn of 1907 Turkish troops occupied not only “doubtful localities” but also adjoining lands which were indisputably Persian territory. The want of a determined line of demarcation

put in hand, and this work lasted from November 1857 till March 1865, when the Porte was informed in May of that year that “in the opinion of the mediating Powers, the future line of boundary between the respective dominions of the sultan and the shah was to be found within the limits traced on the map; that the two Mahommedan governments should themselves mark out the line; and that in the event of any differences arising between them in regard to any particular locality, the points in dispute should be referred to the decision of the governments of England and Russia.” This boundary has remained

between the two countries may have political advantages, but is inconvenient to the geographer and most unfavourable to the cause of order and good government.

From the point on the Aras River 20 m. north-east of Mt Ararat, the river forms the northern boundary down to 48° E. The frontier line then runs about 35 m. in a south-easterly direction through the Moghan steppe to Pilsowar on the Bulgharu River and then south with a bend to the west to the Astara River and the port of Astara in 38° 27' N. and 48° 53' E. From Astara eastwards the boundary
PHYSICAL FEATURES

PERSIA

is formed by the shore of the Caspian until it touches the Bay of Hasan Kul north of Asmab. East of the Caspian Sea and beginning at Has a Kuli Bay to Sverdek and the frontier as far as Chat. It then extends east and south-east to Serrakhs on the Tejen River in 36° 40' N. and 61° 40' E. The distance from Mt Ararat to Serrakhs in a straight line is about 930 m. The frontier from Mt Ararat to Astara was defined by the treaty of Turkmanchay (Feb. 22, 1828), and a convention of the 8th of July 1893. The frontier east of the Caspian was defined by the Akhl-Khorasan Boundary Convention of the 21st of December 1881 and the frontier convention of the 8th of July 1893.

The eastern frontier extends from Serrakhs to near Gwetter on the Arabian Sea in 25° N. and 61° 30' E., a distance of about 800 m. From Serrakhs to near Kuhans the boundary is formed by the Tejen River (called Hari Rud, or river of Herat, in its upper course); it then runs almost due south to the border of Seistan in 31° N., and then through Seistan follows the line fixed by Sir Frederick Goldsmith and Mr. McMahon's commissions in 1872 and 1902-1905 to Kuhali. The frontier north of this point, which separates Persia territory from British Baluchistan and runs south-east to Kuhak and then south-west to Gwetter. This last section was determined by Sir Frederick Goldsmith's commission in 1871.

The southern boundary is the coast line of the Arabian Sea and the Persian Gulf from Gwetter to the mouth of the Shatt al Arab, a distance of about 870 m., comprised between 48° 40' E. and 61° 30' E. The islands situated close to the northern shore of the Persian Gulf are Persian territory; they are, from east to west, Hormuz (Ormus), Larak, Chishma, Furur, Kish (Kais), Hindarabi, Shaikh-Shu'lab, Jibrin, Kharkar, Kharkou (Khorgu).

Physical Geography.—Modern Persia occupies the western and larger half of the great Iranian plateau which, rising to a height of from 8000 to 9000 ft. between the valleys of the Indus and Tigris, covers more than a million square miles. Taking the greater part of the Indus valley or Kopet Dagh to form the northern scarp of this plateau east of the Caspian, we find a prolongation of it in the highlands north of the political frontier on the Aras, and even in the Caucasus itself. Only the extreme south-west of Persia is united by the highlands of Armenia to the mountains of Asia Minor; on the north-west the Paropamisus and Hindu Kush connect it with the Himalayas. The lines of boundary on the western and eastern faces are to be traced amid high ranges of the Taurus and Elburz, broken and diversified by great valleys.

These ranges lie for the most part north-east and south-east, as these lie with the Mediterranean, with the Caspian, and in the west to Khorasan. In the east, stands with the Persians only for the 60 or 70 m. of mountain north and north-east of Teheran, including the cone of Demavend. The great central range, which extends, almost unbroken, for nearly 800 miles from the Caspian to the Arabian Sea, in the east to Khorasan in the west, may be called the Central Range, with peaks from 9000 to 10,000 ft. in height, and some of its summits rise to an elevation of 11,000 ft. near Kermân of nearly 13,000 ft. (3,962 m.).

There are a number of ranges and peaks west of the Central Range, as for instance those of Mahabad and Jalal, which rise to an elevation of 5000 to 6500 ft.; those within the range, as Jasp, Ardahal, So, Pariz, are about 1000 ft. higher, and those of it that extend northwards, in elevation of 5000 to 6000 ft. down to the depressions of the central plain, are to the east of Kurn to the south and Kermân to 1350 to 1700 ft. above the sea-level. Some of the ranges west of the Central Range, which form the highlands of Kurdistan, Loristan, Bakhtiari and Fars, are parallel to its main axis, as the Zagros, or Zag Dagh, on the Caspian side of Armenia,

The rivers that flow from the Russian frontier pass of Cheragh to the river forms the border between Persia and the Russian Transcaucasia.

The drainage of the rivers that have no outlet to the sea and form inland lakes and swamps (kavirs) may be estimated at 350,000 sq. m., including the drainage of Lake Urmia, which is about 26,800 sq. m., Lake Mohurr, Lake Chai, Saf Chai, Murdi Chai and Jaghatu from the east, the Tatu (Titava) from the south, and nine smaller rivers from the west. During heavy rains and when the snows on the hills melt, thousands of torrents rise from the slopes of the highlands of inner Persia, or help to swell the perennial rivers which have no outlet to the sea. These are few in number, and some of them barely suffice for purposes of agricultural irrigation, and in summer widen into small rivers. The perennial streams which help to form the kavirs (salt swamps) east of Kum and Kashan are the Hableh-rud, rising east of Demavend, the Jujrud,
rising north of Teheran, the Kend and Kerej rivers, rising north-west of Teheran, the Shurche-rud (also called Abhar-rud), rising near Sultanieh on the road between Kazvin and Tabriz, and the Karu-rud, which rises near Hamadan and is joined by the Zarind-rud (also called the Kirm-rud), the rain in winter, the Jzirah-rud, the Kur-rud, the Jneh-rud, and the Kum-rud. The river of Isfahan, Zendeh-rud, i.e. “the great river” from Persian sendeh (Pehlevi, sendek), great, but now generally known as Zayendeh-rud, i.e. “the great stream,” is one of the alluvial swamps east of Isfahan. In Fars the Kur with its affluents forms the lake of Bakttegan (also known as Lake of Niraz), and in its lower course, is generally called Bandarim (made famous by the Persian Gulf in the day of the Sultanieh, for the Aram (Prince) Asad-ed-dowleh in the 19th century. “Note on the Kur in Fars,” Proc. Royal Geog. Soc., London, 1891.)

The rivers flowing into the Persian Gulf and Arabian Sea diminish in importance by degrees westward, and sink in barren wastes; the great outfall of the Babylonian rivers is that of the Tigris and Euphrates. The Tigris, flowing into the Tigris from the hills of Kurdistan; the Abi Diz and Karun which unite below Shush, and reach the Shatt al Arab at Mahassan; and the Jazrah and Tab, which with the Karun form the delta of Persian Arabistan, the most extensive and fertile plain in Persia. There are many streams which are affordably at most seasons (some of them are often quite dry) are unfavourable for the rains. Two of these may be mentioned here, viz. the Manid and the Minab, which St John (loc. cit. p. 9) considers as providing most of the water which lead the observer to suppose.” The former, after a run of over 300 m. from its sources in the hills west of Shiraz, debouches at Khor-i-Zirat about 60 m. south of Bushire. It is mentioned by the early geographers as issuing from the mountains of the missap Sackan, and is the Sitakos of Ariand and the Sitiqonas of Pliny. In its upper course it is now known as the Kara-aghach (Wych-elm) River (cf. Notes on the River Mand in Southern Persia, by Asa B. Douglas, London, 1890). It has two outlets into the Persian Gulf, one the Khor-i-Minab, a salt-water creek into which the river overflows during the rains, about 30 m. east of Bandar Abbas, the other the true Minab, at Khor-i-Shad. The course of the latter rises in the mountains of the south-east, and in March 1884, the water flowing past the town was 100 yds. in width and 2 ft. deep (Preece, Proc. Royal Geog. Soc., January 1885). In ordinary seasons very little water of the river runs into its original bed, and the canal, which has been constructed on the banks near Shahabad, the custom-house, about 7 m. inland, for vessels of 20 tons burden.

The “Great desert region of Persia,” writes Le Strange (Lands of the Eastern Caliphate, 1905), “stretches right across the high plateau of Irun going from north-west to south-east, and dividing the fertile provinces of the land into two groups; from it the borders of the Persian Gulf to the Aral and Elburz mountains, that to the north overlook the Caspian, to the arid regions of Markan, which border the Persian Gulf. Thus it measures nearly 800 m. in length, but the breadth varies considerably. As the desert is a result of the steppe or steppe-like vegetation, the most interesting fact at this point is that the area of an hour-glass with a narrow neck, measuring only some 100 m. across, dividing Kermán from Seistan, while both north and south of this the breadth expands and in places reaches to over 200 m. At the west end of the desert, Kuh-i-Taftan, the salt swamps and the dry salt area being more particularly known as the Dasht-i-Kavir, the term Kavir being also occasionally applied to the desert as a whole.

A three-wire telegraph line on iron rods, completed in March 1907, passes through this region, and it is the uneventful lot of some Englishmen stationed at Bam and Nusretabad Ispí (Isbíí, of medieval Arab geographers) on the confines of the desert to report interesting events.

Geology.—Persia consists of a central region covered by Quaternary deposits and bounded by the north, west and south by a raised rim composed of older rocks. These older rocks also occur on the borders of the desert, forming fertile tracts such as the Dasht-i-Lüt, the salt swamps separated by sand-dunes, low ridges of limestone and gypsum, perhaps also by volcanic rocks (Jahrbuch k. k. geol. Reichsanstalt, Vienna, 1877). Dr Sven Hedin explored the northern part of the desert in 1901-2 (see his Travels in Turkistan and Persia, 1903, for the topography).

Good harvests depend on the rainfall from October to April, and on an amount of snow sufficient to cover the crops during the last two months. During dry years the rain falls as a second curve of folding which is probably continued into the Hindu Kush. In the western rim of Persia the fields run from north-west to south-east, and in the south these fields cover a very wide area, following the trend of the coast. The fields in the central Persian chains run from north-west to south-east, parallel to those of the western border. It is seldom that the old crystalline rocks, which form the floor upon which the sedimentary strata were deposited, are exposed to view. Gneiss, granite and crystalline schist, however, are found in the Elburz and in some of the central ranges; and similar rocks form a large part of the Zagros. Some of these rocks are probably Archean, but some appear to be metamorphosed sediments, the oldest part of which is probably in which fossils have yet been found the Upper Devonian. They are well developed in the Elburz range, where they attain a thickness of some 9000 to 10,000 ft., and they have been found also in some of the central ranges and in the Bakhtiar Mountains. In the Elburz range the Devonian is succeeded by a series of limestones with Productus. The greater part of the series belongs to the Carboniferous, but the upper beds are probably of AtACHINE. In the mountain range of the Caspian coast there are occasional seams of coal. The plants which have been found in these beds indicate a Rhaetic or Liassic age. The Middle and Upper Jurassic form a considerable portion of the Elburz and have yielded some rare forms of marine fossils, such as the ammonites. The Cretaceous system is very widely spread in Persia. It is one of the most conspicuous formations in the Zagros and in the central ranges, and probably forms a large part of the plateau, beneath the Quaternary deposits. The most prominent member of the series is a massive limestone called Hipparionites belonging to the upper division of the system. The Tertiary deposits include nummulitic limestone (Eocene); a series of limestones, sandstones and conglomerates, with marine Miocene fossils, and red marls and sandstones. These rocks belong to the upper Miocene. In the Elburz there is a considerable deposit of palagonite tuff which appears to be of Oligocene age. The nummulitic limestone takes part in the formation of the Hindu Kush, and the Central Mountain System is in the most part a series of the, of the mountains, or in the valleys; but occasionally they are found at higher levels. Piocene deposits cover a considerable area near the coast. Both in the Elburz range and near the Baluchistan coast the Miocene beds seem to be extinct, but several continue to emit vapours and gases. Demavend in the Elburz and Kuh-i-Taftan on the Baluchistan frontier are among the best-known.

Climate.—For the rainfall on the watershed of the Persian Gulf there are two places of observation, Bushire and Jask; at the first it is a little in excess of that at inner Persia, while at the second it is very much less. The rainfall on the Caspian watershed greatly exceeds that of inner Persia; at Astara and Ashabad, in the north-eastern and south-eastern corner of the Caspian, it is about 50% more; and at Resht and Lenkoran, in the south-western corner, it is four and five times that of the adjoining districts across the ridges to the south. With the exception of the Caspian, whose waters are derived from the provinces and even from Russia at high freights, causing the price of bread at Teheran to rise 300%.

The following is the mean annual rainfall in inches at fifteen stations in and near Persia.

Total for Year: 6.0

Mean Temperature: 19° C.
to the bearing of the axes of the great mountain chains. A dry and warm wind comes down from the snowy Elburz to Gilan in December and January, and much resembles the fohn of the Alps (Dr Thiolozan, "Sur les vents du Nord de la Perse et sur le foehn du Guilan," Comptes rendus, Acad. d. Sciences, March 1882).

Observations for temperature have been taken for many years at the stations of the Indo-European Telegraph and for a few years at the British consulate in Meshed, and the monthly and annual means shown in the following table have been derived from the indications of maximum and minimum thermometers in degrees Fahrenheit.

Very few hygrometrical observations have been taken, and only those of the British residency at Bushire are more or less trustworthy, and have been regularly registered for a number of years. The air is exceptionally dry, and in many districts polished steel may be exposed in the open during a great part of the year without becoming tarnished. Along the shores of the Caspian, particularly in Gilan and Mazandaran, and of the Persian Gulf from the mouth of the Shatt el Arab down to Bandar Abbas, the air during a great part of the year contains much moisture—dry- and wet-bulb thermometers at times indicating the same temperature—and at nights there are heavy falls of dew. In Gilan and Mazandaran the air contains much moisture up to considerable elevations and as far as 30 to 40 m. away from the sea; but along the Persian Gulf, where vegetation is very scanty, stations only a few miles away from the coast and not more than 20 or 30 ft. above the sea-level have a comparatively dry climate.

2 Consular report (Gilan, 1897).
4 1899-1907.
5 Observations taken at the telegraph stations, and kindly communicated by Mr R. C. Barker, C.I.E., director of the Indo-European Telegraph Department in Persia. Those for Isfahan are during the years 1900-1907.

As being of the desert type with Palaearctic species in the more fertile regions." In the Caspian provinces he found the fauna, on the whole, Palaearctic also, 'most of the animals being identical with those of south-eastern Europe.' The south-western part of the province possesses the most typical indigenous, and he observed "a singular character given to the fauna by the presence of certain Eastern forms, unknown in other parts of Persia, such as the tiger, a remarkable deer of the Indo-Malayan group, and the rhinoceros, a mammal of the same region. Including the oak-forests of Shiraz with the wooded slopes of the Zagros, he found in his third division that, however narrow was the tract, it appeared to contain, like the second, "a Palaearctic fauna with a few peculiar species." As to the Persian Gulf, however, in the southern provinces of the Iranian plateau "the most part desert types, whilst the characteristic Palaearctic species almost entirely disappear, their place being taken by Indian or Indo-African forms. The Persian Gulf Arabs, though most of them are a pair of deer, which make it particularly familiar, and has always a value in the Indian market. Among others the wandering Turkish tribes in Fars have the credit of possessing good steers. The Turkoman horse of Khorasan and the Afghans is a good animal, and can be considerably increased with marvelous power and endurance. Colonel C. E. S. Stuart stated that the Khorasan camel is celebrated for its size and strength, that it has very long hair, and bears cold and exposure far better than the ordinary Arabian or Persian camel, and that, while the ordinary Persian camel can carry a load of 100 lb., the Indian camel one of some 400 lb., the Khorasan camel will carry from 600 to 700 lb. The best animals, he notes, are a cross between the Bactrian or two-humped and the Arabian or one-humped camel. Sheep, goats, and cats are good of their kind; but not all the last are the beautiful creatures which, bearing the name of the
country, have arrived at such distinction in Europe. Nor are these to be obtained, as supposed, at Angora in Asia Minor. Van or Isfahan is a far more habitable situation. The cat at the first place, called by the Turks "Van kedisi," has a certain local reputation. Any person who has seen the Persians squatting in the open air on bear, hyena, hog, badger, porcupine, pole-cat, weasel, marten, wolf, jackal, fox, hare, wild ass, wild sheep, wild cat, mountain-gazelle and deer. The tiger is peculiar to the Caspian province. It is a rare animal, as are all large carnivores. Between the two specimens, one to 10 ft. 8 in., the other 8 ft. 10 in. from the tip of the nose to the end of the tail. Lynxes and bears were to be found in the same vicinity, and the wild pig was both numerous and ferocious.

According to Blanford, there are about four hundred known species of birds in Persia. The game birds have admirable representatives in the pheasant, "karkavil" (Phasianus colchicus; L.); snowcock (Tetraogallus; Gmel.); black partridge, "durraj" (Francolinus vulgaris; Steph.); red-legged partridge, "keb" (Caccabis chukar; Gray); sand-partridge or seecoe, "t thu" (Ammodramus bonhami; Gray); Indian grey partridge, "belderjin" (Coturnix coturnix; Bonn.); sandgrouse, "sivas-sineh" (Pitocetes arenarius; Pall.); bustard, "hubareh" (Otis tarda; L. and O. M'Couney; Gray); woodcock, snipe, penguin, many kinds of goose, duck, &c. The flamingo comes up from the south as far north as the neighbourhood of Teheran; the stork abounds. Poultry is good and plentiful. A large kind of fowl known as "Lari" (from the province Lar, in southern Persia) is said to be a descendant from birds brought to Persia by the Portuguese in the 16th century.

The fish principally caught along the southern shore of the Caspian are the sturgeon, "sagmahi," dogfish (Aspension rubinus and A. rubra; L.); herring (Clupea harengus; L.); mullet (Mugil; L.); salmon, "aaaz mahi" (Salmo salar); trout, "maseh" (Salmo trutta); carp, "kupur" (Cyprinus ballerus and C. carpio); bream, "subulu" (Abramis brama); pike-perch, "mahi safid" (Perca fluviatilis; L.); and a number of other species. Fish are also a plentiful and frequent food only the southern half of the Caspian, not passing over the shallow part of the sea which extends from Baku eastwards. As it was first observed near the mouth of the river Kur it has been named the Kur river fish. In the inner Persia the right and left trout and mud-trout are plentiful in some of the mountain streams. Many underground canals are frequently cultivated by carp and roach. The sluice has also been observed in some streams which flow into the inner parts of the Caspian. 

Flora.—In the provinces of Gilan, Mazendaran and Astrabad on the Caspian, from the shore to an altitude of about 3000 ft. on the northern slopes of the great mountain range which separates those provinces from the highlands of Persia, the flora is similar to that of Griaebach's "mediterranean region." At higher altitudes many forms of a more northern flora appear. As we approach inner Persia the flora rapidly makes way to steppe vegetation in the plains between the mountain ranges. The steppe vegetation extends in the south to the outer range of the hills which separate inner Persia from the Persian Gulf and the Indian Ocean. Beyond this outer range and along the shore of the Persian Gulf is that of the "Sahara region," which extends eastwards to Sind.

Generally speaking, everywhere, excepting in the northern lowlands and in a few favoured spots in the hilly districts, the vegetation is of the desert type. In inner Persia the hills and plains are bare of trees, and steppe and desert predominate. The date-palm thrives, as far north as Tabbas in latitude 33° 36' and at an altitude of 2000 ft. and in the south extensive date-groves, producing colossal fruit, exist at altitudes of 2000 to 5000 ft. The olive is cultivated at Rudbar south of Rehsh in Gilan, and a few isolated olive-trees have been observed in central and southern Persia.

Of the variety of fruit great, and more so in the former Europe and Asia Minor; The commonest are excellent melons, water-melons, grapes, apricots, cherries, plums, apples, are within the reach of the poorest. Less common and picked fruits are expensive, particularly so when cost of transport is added to their price. The more exquisite sorts are 2d. or 3d. in Teheran, while in Mazendaran (only 100 m. distant), whence the oranges are brought, it costs 7d. Some fruits are famous and vie in excellence with any that European orchards produce. The pears and peaches of Kerman and Isfahan, the apples of Demavend, pears of Natanz, figs of Kermanshah, &c. The strawberry was brought to Persia about 1859, and is much cultivated in the gardens of Teheran. It was also cultivated at the same time, but is not much appreciated. Currants and gooseberries are now also grown. The common vegetables also are plentiful and cheap, but only a few, such as the broad-bean, egg-plant, "laleh," luffa, acorn, &c. Asparagus became a highly appreciated by the natives, who generally do not take kindly to newly-introduced varieties. The tomato, although successfully cultivated in Persia since about 1780, has not yet found favour, and to-day may be said to be in the tomato, asparagus, celery and others. Flowers are abundant, but it is only since the beginning of Naser ed din Shah's reign (1848), when European gardeners were employed in Persia, that they were rationally cultivated. Nearly all the European garden flowers, even the rarer ones, can now be seen not only in the parks and gardens of the rich and well-to-do but in many unpretentious courtyards where they help to brighten the more utilitarian surroundings.

Population.—In 1881 the present writer estimated the population of Persia at 7,653,600; 1,963,800 urban, 3,780,000 rural and 1,909,800 wandering ("Bevölkerung der Erde.") p. 28; Encyc. Brit. 9th ed. P. 628); and, allowing for an increase of about 13% per annum the population for 1910 may be estimated at 10 millions. No statistics whatever being kept, nothing precise is known of the movement of the population. During the ninth decade of the 19th century many Persian subjects emigrated, and many Persian villages were deserted and fell to ruins; since then a small immigration has set in and new villages have been founded. Persians say that the females exceed the males by 10 to 20%, but whenever the present writer has been able to obtain trustworthy information he found the excess to be less than 2%. Of the deaths in any place the only check obtainable is from the public body-washers, but many corpses are buried without the aid of the public body-washers; and the population of the place not being accurately known, the number of deaths, however correct, is useless for statistical purposes. Medical men have stated that the number of deaths, in times when there are no epidemics, amounts to 10 or 20 per thousand, and the number of births to 25 to 40 per thousand.

The prices of the staple articles of food and all necessaries of life have risen considerably since 1880, and, particularly in the large cities, are much over what they were at the rate at the same time, many of the upper classes and officials are not so well off as formerly. By dismissing their servants in order to reduce expenditure, they have thrown great numbers of the poorer classes on the streets. A large number of the poorer are living very poorly and often suffer want. Tradesmen are less affected, because they can sell the articles which they manufacture at values which are more in proportion with the increased prices of food. As trade in 1880 was only about half of what it was in 1889, a month's wages could afford to keep a family; by 1908, in irans, he earned double what he did in 1880, but his wage, expressed in sterling, was the same, and whatever the prices of food have risen more than his wages and the value of his goods. While towns and cities the number of births is therefore reduced, while at the same time the mortality, in consequence of bad and often insufficient food, is considerably increased.

The description of the Persian character by C. J. Wills, in his book "In the Land of the Lion and Sun" (1883), is still worth quoting—:

"The character of the Persian is that of a easy-going man with a wish to make things pleasant generally. He is hospitalable,children and a son, his respect for both parents is excessive, developed in a greater degree to his father, in whose presence he will rarely sit down at table. It is in the hands of addressing and speaking that his "master." The full stream of his love and reverence is reserved for his mother; he never leaves her to starve, and her wishes are laws to him. The mother is always the most important member of the household, and the grandmother is treated with veneration. The presence of the mother-in-law is coveted by their sons-in-law, who look on them as the guardians of the virtue of their wives. The paternal uncle is a much nearer tie than with us; while men look on their first cousins on the father's side as their most natural wives.

"Black slaves and men-nurses or 'lallahs' are much respected; the 'dayah' or wet nurse is looked on as a second mother and the 'dic' or baby-sitter is regarded as a friend and advisor. A servant's master will often be addressed by his servant as his father, and the servant will protect his master's property as if he would own it. A servant is invariably spoken to as 'bacha' (child). The servants expect that their master will never allow them to be wronged. The slaves in Persia have a good time; well fed, well clothed, treated as spoiled children, given the lightest work, and often given in marriage to a favourite son or taken as mistresses. While it is true that this is a condition of servitude, it is also the case that the children are educated. The master will give him his liberty and let him earn his living. They vary in colour and value: the ' Habashi' or Abyssinian is the most valued; the Shalhali or Somali, next in blackness, is next in price; the Bombay, or coal-black negro of the interior, being of much less price, and usually only used as a cook. The prices of slaves in Shiraz are, a good Habashi girl of twelve to fourteen £40, a good Somali..."
same age, half as much; while a Bombaasi is to be got for £14, being chosen merely for physical strength. They are never sold, save on importation, though at times they are given away. I have never seen a Persian unkind to his own horse or his slave, and when overworked and ill, they are always kindly treated. Their wages consist of a bounty; and though there are no workhouses, there are in ordinary times no deaths from starvation; and charity, though not organized, is general.

Procration is the attribute of all Persians, in the literal sense of eating over the answer to any proposition, and the term "to-morrow" means indefinite delay. A great dislike is shown generally to a written contract binding the parties to a fixed date; and, as a rule, on breaking it the Persian always appeals for and expects very little indemnity.

Persians are clean in their persons, washing themselves and their garments frequently. The Persian always makes the best of his appearance; he is very neat in his dress, and is particular as to the sit of his hat and the cut of his coat. All Persians are fond of animals, and do not treat them badly when their own property.

"Cruelty is not a Persian vice; torture and punishments of an unusual and painful nature being part of their judicial system. There are no vindictive punishments, such as a solitary confinement, penal servitude for long terms of years, &c. Seldom, indeed, is a man imprisoned more than twelve months, the rule being that there is a general jail delivery at the New Year. Royal clemency is of course universal, but particularly ofjudges and military commanders.

Costume.-The costume of the Persians may be shortly described as fitting to their active habits. The men invariably wear an unstarched shirt of cotton, sewn with white silk, often, particularly in the south, of muslin, but even there it is sometimes embroidered with silk. It fastens in front by a flap, having two small buttons or knots at the left shoulder, and seldom comes below the hips. It has no collar, and the sleeves are loose. The lower orders often have it dyed black and uppers white. It is worn over a full length pantaloons, or tights. Silk shirts are now seldom seen on men. Among the very religious during the mourning month ("Muharram") the shirt is at times dyed black. The zar-jamah, or trousers, are of cloth arranged in a close and either of cotton, or silk, worsted or chenille, or even of rich silk, and are sometimes jewelled, especially the borders. They are fastened with buttons, or perhaps, if a necklace, or a false one, is worn around the waist, with the aid of a small silk cord. When engaged in hard or dirty work, or when running, generally tuck the end of these garments under the cord, which leaves their legs bare. It is the custom of their attire enables the Persian to sit without discomfort on his heels; chairs are only used by the rich, great or Europeanized. Over the shirt and "zar-jamah" comes the arkalik generally of white cotton, or of a close and either of cotton, or silk, worsted, or even of rich silk, and is sometimes jewelled, especially the borders, and perhaps the buttons. It has a pocket-hole on either side, giving access to the pockets, which are always in the "arkalik," where also is the breast-pocket in which watch, money, jewels, and seals are kept. The length of the arkalik damns the class of the wearer. The military and official classes and the wearers of servants wear it short, to the knee, while fops and Statespersons wear it even shorter. Priests, merchants, villagers, especially about Shiraz, townsmen, shopkeepers, doctors and lawyers wear it very long, and the "shah" is the most splendid. The kaman or "kuljiah," or coat. This is, as a rule, cast off in summer, save on formal occasions, and is often borne by a servant, or carried over the shoulder by the owner. It is of cloth, shawl or camel-hair cloths, or of silk, or muslin, or cotton, or otherwise, according to the time of the year and the purse and position of the wearer. This, like the "arkalik," is open in front, and shows the shirt. It sometimes has a small standing collar, and is buttoned or laced. It has a pocket-hole on either side, giving access to the pockets, which are always in the "arkalik," where also is the breast-pocket in which watch, money, jewels, and seals are kept. The length of the kaman indicates the class of the wearer. The military and official classes and the wearers of servants wear it short, to the knee, while fops and Statesmen wear it even shorter. Priests, merchants, villagers, especially about Shiraz, townsmen, shopkeepers, doctors and lawyers wear it very long, and the "shah" is the most splendid. The kaman or "kuljiah," or coat. This is, as a rule, cast off in summer, save on formal occasions, and is often borne by a servant, or carried over the shoulder by the owner. It is of cloth, shawl or camel-hair cloths, or of silk, c...
The face on important occasions is usually much painted, save by young ladies in the heyday of beauty. The colour is very freely applied, the cheeks being as much reddled as a clown’s, and the neck smeared with white, while the eyelashes are marked round with kohl. This is supposed to be beneficial to the eyes, and almost every woman uses it. The eyebrows are widened and painted till they appear to meet, while shawm moles or stars are painted on the chin and cheek; even spangles are stuck at times on the chin and forehead. Black indigo colour on the lips, and Falash seams, is seen among the upper classes. The hair, though generally hidden by the “char-kadd,” is at times exposed and plaited into innumerable little tails of great length, while a coquetish little skull-cap of embroidery and silk, or a small hair plait, habitually used by the Persia ladies’ hair is very luxuriant and never cut; it is nearly always dyed red with henna, or with indigo to a blue-black tinge; it is naturally a glossy black. Fair hair is not esteemed. Blue eyes are not uncommon, but brown ones are rare. A full moon face is much admired, and a dark complexion termed “namak” (salt) is the highest native idea of beauty. Most Persian women are small, with tiny feet and hands. The figure is always lost after maternity, and no support of any kind is worn.

A very short jacket, of gay colour, quite open in front, having tight sleeves with many metal buttons, is usually worn in summer, and a lined outer coat in cold weather. In winter a pair of very short white cotton trousers are used, and the upper leg covered with a thick heel; in summer in the house ladies go often barefoot. The rest of the costume is composed of the “tumblr” or “shalwar,” short skirts of great width, held by a running string—the outer one being usually of blue cotton, and the inner one of a different colour. A flat wide lace, or, among the poor, of loud-patterned chintz or print. Beneath are innumerable other garments of the same shape, varying in texture from silk and satin to print. The whole is very short, amply furnished and comfortable. In summer only and in winter an over-mantle like the “kuliah,” or coat of the man, with short sleeves, lined and trimmed with wua, is worn. Leg-coverings are now being introduced. In ancient days the Persian ladies always wore them, as may be seen by the pictures in the South Kensington Museum. Then the two embroidered legs are really the most fashionable as Persian embroideries (“nakh”), occupied a girl from childhood to marriage in making; they are all sewing in elaborate patterns of great beauty, worked on muslin in silk. The outdoor costume of some of the Persian women is quite another thing. Enveloped in a huge blue sheet with a yard of linen as a veil perforated for two inches square with minute holes, the feet thrust into two huge bags of coloured stuff, a wife is completely unrecognizable, and only her face is known by her husband, when out of doors. The dress is the same; and, save in quality or costliness, the effect is similar.

As for the children, they are always when infants swaddled; when they can walk they are dressed as little men and women, and both girls and boys wear similar dress. In the summer they go barefoot. When they are a little older, the boys and girls are dressed like little men and women, and little boys as girls, till they reach the age of seven or eight years; this is often done for fun, or on account of some vow—often to and fro.

_Towns.—_The principal cities of Persia with their populations, as estimated in 1906 are: Teheran (280,000); Tabriz (200,000); Isfahan (100,000); Meshed (80,000); Kermān, Resht, Shiraz (60,000); Barfurush, Kazvin, Yazd (50,000); Hamadan, Kermānshāh (40,000); Kashan, Khoi, Urmia (30,000); Birjand, Burjirjīd, Bushire, Dizful, Kermān, Senedjīn (Sinna), Zanjend (25,000 to 30,000); Amol, Ardebel, Ardistan, Astarabad, Abukesh, Bam, Bandar, Abbasī, Bandar Lingah, Damghān, Dilman, Isatbanbat, Jahlun, Kuhsar, Kumishah, Kuchan, Marand, Maragha, Nishapur, Sari, Sabzevar, Saman, Shahrud, Shushter (10,000 to 20,000).

**Political and Administrative Divisions.**—The empire of Persia, officially known as Mamalik i Mahrush i Iran, “the protected kingdoms of Persia,” is divided into a number of provinces, which, when large, and containing important sub-provinces and districts, are called mamlāks, “kingdoms,” when smaller, vilayet and ayat, and are ruled by governors-general and governors appointed and directly responsible to the shah. These provinces are further divided into sub-provinces, vilayets, districts, sub-divisions and parishes, buluk, nahiya, mahal, and towns, cities, parishes and villages, shehr, kossaheh, mahalleh, dīl, which are ruled by lieutenant-governors and other functionaries appointed by and responsible to the governors. All governors are called hakim, or hukmān, but those of large provinces generally have the title of valī, and sometimes firman-firma. A governor of a small district is a zabbī; a deputy-governor is called naib el hukmeh, or naib el ayahel; an administrative division is a kalamr, or hukumāt. Until recently the principal governorships were conferred upon the shah’s sons, brothers, uncles and other near relatives, but now many of them are held by men who have little if any connexion with the royal family. Also, the governors are now, as a rule, resident in their provinces instead of being absentees at the capital. There are also some small districts or dependencies generally held in ñef, tursul, by princes or high functionaries who take the revenues in lieu of salaries, pensions, allowances, &c., and either themselves govern or appoint others to do so.

Every town has a mayor, or chief magistrate, called beglerbegi, “lord of lords,” kalantar, “the greater,” and sometimes darogha, “overseer,” or chief of police; every ward or parish, mahalleh, of a town and every village has a head-man called ked khoda, “house-lord.” These officers are responsible to the governor for the collection of the taxes and the orderly state of their towns, parishes and villages. In the important provinces and sub-provinces the governors are assisted by a man of experience, to whom the accounts and details of the government are entrusted. This person, called visīr, or pasīshkar, is often nominated by the shah, and his functions in the provincial government are similar to those of the grand vizier in the central government, and comprise very extended administrative powers, including at times the command of the military forces in his province. Among the nomads a different system of titles prevails, the chiefs who are responsible for the taxes and the orderly conduct of their tribes and clans being known as ikhkan, ilbēgi (both meaning “tribe-lord,” but the latter being considered an inferior title to the former), khān, rāis, amīr, mir, shakib, tushmāl, &c. The governors and chiefs, excepting those possessing hereditary rights, are frequently changed; appointments are for one or two years only and are sometimes renewed, but it does not often occur that an official holds the same government for longer than that period, while it happens rarely that a province is governed by the same person for two or three years. This was not so formerly, when not infrequently an official, generally a near relation of the shah, held the same governorship for five, ten or even more years. The governorship of the province of Azerbaijan was an exception until the end of 1906, being always held by the Valāshād, “heir apparent,” or crown prince.

The political divisions of Persia, provinces, sub-provinces, districts, and the several minor divisions over which cf. the statement in Nöldéke’s Geschicht der Artachshār Pāpakdān, “after Alexander’s death there were in Iran 240 local governments”), but the administrative divisions, hukumāts, or kalams, with governors appointed by the Crown, were responsible to him, and in the provinces have been under fifty for sixty-five years or more. In 1840 there were twenty-nine administrative divisions, in 1868 twenty-two, in 1875 twenty-nine, in 1884 nineteen, in 1890 forty-six, and in 1908 thirty-five, as follows:

(a) _Provinces:_

1. Arabistan and Balchtiari.
2. Astarabad and Gurgan.
3. Azerbaijan.
4. Fars.
5. Gerus.
7. Hamadan.
8. Irāk, Gulpaiya, Khunsar, Kerman, Kezzar, Persān, Kūshān, Shahrud, Shushtar (10,000 to 20,000).

(b) _Dependencies, or Prefectures:_

1. Asadabad.
2. Demavend.
3. Fereydunshāh, Khorassān.
4. Fārs, Gorus, Kerman, Kermān, Kord, Qeshm, Sala, Yezdi, Kerāk, Yezdī, Kermānshāh, Musulam, Bah Ṭaffrūz.
5. Zerdos and Bagdādu.

**Shahsevens.**

**Roads.—_**With the exception of five short roads, having an aggregate length of less than 900 m., all the roads of the country are mere mulch tracks, carriagable in the plains and during the dry season, but totally unfit for continuous wheeled traffic during all seasons, and in the hilly districts often so difficult as to cause much damage to goods and the animals carrying them. There are a few miles of roads in the immediate neighbourhood of Teherān leading from the city to royal palaces, but not of any commercial
importance. The five exceptions are: (1) Reish-Kazvin—Teheran, 227 m.; (2) Julfa—Tabriz, 80 m.; (3) Teheran—Kum—Sultanabad, 160 m.; (4) Meashed—Kuchan—Askabad, 150 m.; and (5) on which are Russian territory; (5) Isfahan—Alvaz, 260 m. The first of these routes was opened to traffic in 1863, the second in 1889, the third in 1877, the fourth in 1879 by a Russian company, in virtue of a concession which the Persian government granted in 1853; and the second section was constructed partly by the British and partly by the Russian company, which about £20,000, ceded to the concessionaire of the first section in 1896, and repaired and partly reconstructed by the Russian company in 1898—1899. Both sections were officially opened to traffic in August 1896, and were in the conveyance of the company for a period of only five years; the greater part of the stock was paid out by the Russian government and was henceforth managed by the company. The first section was opened in 1897—1899 by a Russian company, in virtue of a concession which the Persian government granted in 1853; and the second section was constructed partly by the British and partly by the Russian company, which about £20,000, ceded to the concessionaire of the first section in 1896, and repaired and partly reconstructed by the Russian company in 1898—1899. Both sections were officially opened to traffic in August 1896, and were in the conveyance of the company for a period of only five years; the greater part of the stock was paid out by the Russian government and was henceforth managed by the company.

The second road, Julfa—Tabriz, 80 m., was constructed by the same company in 1903. The third road, Teheran—Kum—Sultanabad, 160 m., by which all the state mail passes from Teheran to Sultanabad, a distance of 105 m., was opened in 1889; the other road, Kum—Sultanabad, 68 m., was opened in 1885. The first section was constructed by the Persian government in 1885 at a cost of about £12,000, purchased by the Imperial Bank of Persia in 1889 for the purpose of constructing an additional line between the two. The second section formed part of the "Avraz road concession," which was obtained by the Imperial Bank of Persia in 1890 with the object of connecting Teheran with Alvaz on the Küri road by a direct cargo road. The opening of this road, which consists of a single-track, single-gauge, and is used for the carriage of passengers and goods, was in 1897, under the management of the British Government. The line is worked by a British company, the Teheran—Sultanabad Railway. The road was opened for traffic in the autumn of 1900. The revenue is derived from tolls levied on animals passing with loads. The tolls collected in 1907 amounted to £3100.

The Persian Telegraphs.-Persia possesses only 8 m. of railway and 64 m. of tramway, both worked by a Belgian company. The railway consists of a single line, one-metre gauge, from Teheran to Shah-abdul-Azim, south of Teheran, and of two branch lines which connect the main line with the Caspian Sea and with the Gulf of Persia. The tramway also consists of a single line, one-metre gauge, and runs through some of the principal streets of Teheran. The length of the main railway line is 34 m., that of the branches 25 m. The main line was opened to traffic on 15 August 1869, and the tramway opened in 1889. The capital now invested in the enterprise, and largely subscribed for by Russian capitalists, amounts to £526,000. There are also ordinary shares to the amount of £30,000.

The general opinion is that if Russian capitalists had not been interested in the enterprise the company would have had a very difficult time. (On railways in Persia, the many concessions granted by the government, and only one having been obtained by the Russian company, see ch. xviii. of Lord Curzon's Persia [pp. 615—639], and on the Belgian enterprise, Lorini's La Persia economica [pp. 157—158] may be consulted.

Down to 1874 the postal system was in the hands of an official called chaparchi bashi, who was the head of the post, or chapars, and letters and small parcels were conveyed by him and his agents at high and arbitrary rates and without any responsibility. The postal department of the Persian government is well established. The French government obtained the concession for the delivery of the shah Nas-ed-din's first visit to Europe (1873). Two offices of the Austrian postal department have been engaged in 1874, an experiment for a post office upon European lines was made in the first instance to a number of post offices in the capital and some of the neighbouring villages, where the Eastern Telegraph has summer quarters. In the beginning of 1876 a regular weekly post was established between Teheran, Tabriz and Julfa (Russian-Persian frontier). The paper lines, connecting all the principal cities with the capital, were opened for general delivery in the principal cities, and are partly worked by the Imperial Russian Post, and partly by the Russian government. The inland rates were a little less. There are now between Persia and foreign countries a bi-weekly service via Russia (Reish-Baku, Tabriz-Tiflis) and a weekly service via India (Bushire-Bombay). On the inland lines, with the exception of that between Teheran and Tabriz, the service is weekly. There are reported to be 140 post offices. Statistics as to the number of letters, post-cards, newspapers, &c., conveyed are kept but not published; and since 1885, when a liberal-minded director communicated those for the year 1885, no figures have been given. In the year 1854—1855 there were conveyed 1,308,855 letters, 2,050 post-cards, 7,455 samples, and 173,955 parcels, having a value of £240,720; and the receipts exceeded the expenditure by £17,256. During the years 1856—1857 the receipts increased, and the excess of receipts over expenditure in the year 1886—1889 was reported to have been £10,000, but was probably more than that, for the minister of posts farmed the department for £25,000, the company having in the year 1886—1889 received £65,000. In the following year the post office was joined to the customs department worked by Belgian officials. Under the favourable circumstances of Post Office until 1889, when they were awarded to a Russian company, the Persian government received £31,846 in fees, and between 1889 and 1890 £37,644. Letters, post-cards, and parcels were sent in the Persian post-office service to and from India, at Bushire in 26 days, at Shiraz in 31, at Isfahan in 36, and at Teheran in 40 days; but during the winter letters between London and Teheran sometimes take a month. In the interior the more expensive on horseback, and for which made soft leather bags, are frequently damaged through careless packing and wet. The first Persian postage stamps were issued in 1875 and roughly printed in Persia. Since then there have been numerous issues, some of which have been printed and some of which have been engraved. Authentic specimens of the early ones are much valued by stamp collectors. (For information on the postal system of Persia, see G. Riederer, Aus Persien, Vienna, 1882; Fr. Schueider, Die persische Post und die Postwesen in Persien, Vienna, 1893.)
Teheran-Meshed line (555 m.), however, is looked after by an English inspector and two English clerks at Meshed, and since 1889 the Indian government has allowed a sum not exceeding 20,000 rupees per annum for its maintenance; and the Meshed-Isfahan line, 523 m., is looked after by twelve Russian inspectors and clerks. The Persian lines are formed out of 1,800,000 krans (about £36,000) per annum and no statistics are published. There are in all 131 stations. Statistics of the traffic on the Indo-European line are given in the annual publications of the Persia railway, and the traffic is conducted through the telegraph department, published by government, and from them the figures in the following table have been obtained:

Manufacturers, &c.—The handbook on Persian art published by Colonel Murdoch Smith, R.E., in 1876, with reference to the collection purchased and sent home by him for the Victoria and Albert Museum from various parts of Persia, contains a list of the manufactures of the country. They are classified under the respective heads of "porcelain and earthenware," "tiles," "arms and armour," "textile fabrics," "needlework and embroidery," "metal-work," "wood carving and mosaic-painting," "manufactory of "jewelry" and "musical instruments." Specimens of the greater number are not only to be procured in England, but are almost familiar to the ordinary Londoner. It need scarcely be said that tiles, more rather increased in value, deteriorated in the eyes of the connoisseur, that the ornamentation of metal-work, wood carving and inlaying, gem and seal engraving, are exquisite of their kind, and that the carpets manufactured by skilled workmen, when left to themselves and their own taste, are to a great extent unrivalled. Of the above-mentioned articles, carpets, shawls, woollen and cotton fabrics and silk stuffs are the most important. Carpets may be divided into three categories: (1) Kali, with a pile, and like plush; (2) gilim, smooth; (3) n失眠fei. Only the two first are exported. The Kali and its smaller sizes, called Kalicheh (in Europe, rugs), are chiefly made in Ferehan, Sultanabad (Irk), Khorasan, Kurdistan, Karadagh, Yezd, Kermán, and among the Turcoman tribes. Of these the most valuable are the first, while the second kind, gilim (used in Europe for curtains, hangings, and chair-covers), considerable quantities are exported from Shushtar and Kuşdest. The value of the carpets exported during the year 1898-99 was £161,350. Russia £169,700, United States £40,600, Great Britain £67,000, Egypt £18,500 and India £5,400. Shawls are manufactured in Kermán and Meshed, and form an article of export, principally to Turkey. Woollen fabrics are manufactured in many districts, but not exported in any great quantity. Coarse cotton stuffs, chiefly of the kind called Kerbas, used in their natural colour, or dyed blue with indigo, are manufactured in all districts but not exported. Fabrics are manufactured in parts of Persia, and block-printed in colours at Isfahan and Kuhimad, find their way to foreign markets, principally Russian. Of silk fabrics manufactured in Persia, principally in Khorasan, Kerman and Fars, those produced in the southern parts, and of the best qualities, are exported by foreign capital and conducted by foreigners, but nearly all have resulted in loss. In 1879 the Persian government was induced to spend £30,000 on the erection of a glass factory in Teheran, but the work was soon abandoned for want of coal. A few years later a Persian bought the factory and plant for £10,000, and made them over in 1891 to the Compagnie générale pour l'éclairage et le hauffage en Perse, which after bringing out much additional plant, and wasting much money, found it impossible to make and cheap gas out of bad and dear coal, closed the factory. In 1891 another Belgian company, Société anonyme des verrières nationales de Perse, opened a glass factory in Teheran, but the difficulty of obtaining the raw material cheaply and in large quantities was too great to make it paying a concern, and the factory had to be closed. A third Belgian company, Société anonyme pour la fabrication du sucre en Perse, with a large capital, then came to Persia, and began making beetroot sugar in the winter of 1895. But, like the glass and glass companies, it found the cost of raw material too high, and for want of capital closed its operations in 1899. In 1890 a Russian company started a match factory near Teheran with an initial outlay, it is said, of about £20,000, but could not successfully compete with Austrian and English manufacturers, and is said to have been closed. In 1892 a gentleman erected a cotton-spinning factory at Teheran in 1894 with expensive machinery; it turned out some excellent yarn but could not compete in price with imported yarns.

Internal Products.—In different parts of Persia are grown in all districts, the two former up to considerable altitudes (8000 ft.), the last wherever the water supply is abundant, and in inner Persia generally along rivers; and all three are largely exported. The most valuable are cotton, rice, and sugar, of which they require for local consumption and supply other districts, or export great quantities, are Anazar, Mazandaran, Gilan, and Veramin, (near Teheran). Lenjan (near Isfahan), and some localities in Fars and Azerbaijan. Peas, beans, lentils, grain, maize, millet, and rice are also universally cultivated, and exported from the Persian Gulf ports to India and the Persian coast. The export of rice amounted to 32,000 tons in 1899-1900, and was valued at £67,550. The Persian fruit is excellent and abundant, and large quantities, principally dried and called khushkbar (dry fruit), as quinces, peaches, apricots, plums (of several kinds), raisins, figs, almonds, pistachios, walnuts and dates (the last only from the south), as well as oranges and lemons, are grown in the Caspian valleys, and were exported during 1895-1896, valued at £1,019,000. Nothing is being done to improve the vine, and the Persian wines, until recently of world-wide reputation, are yearly getting thinner and poorer. A company has been formed by Mr. M. G. Gmelin, who explored the southern shores of the Caspian in 1771, and noted that wines of Gilan were made from the wild grape. Cotton is largely grown, principally in the central districts and the south-west; the cotton grown in the south-west is of a high quality, and sold in the British market at a price which makes it profitable to pay the expenses of bringing them to Isfahan, and even to Shush, the market of the Bas, where the staple of Persian cotton is purchased. The prices of cotton and tobacco, in the Persian market, are generally fixed by the British and Belgian governments, and the production of the two is of very great importance. Tobacco is grown in the south, in the district of Reihist, and in Gilan, and is valued at from £30,000 to £50,000. It is exported to India, and is sold at about 46s. each, to the value of £1,000,000, to various countries. The price of tobacco is generally on the increase, and the Persian government has taken great care to regulate it. The export of tobacco in 1895-1896 amounted to £12,000,000, and was valued at £30,000,000.

The most valuable of the Persian exports is the silk, which is obtained from the silkworm, and is grown in the south-east of the country, chiefly in the district of Fars, where the silk obtained is of excellent quality. The silk is exported to India, and is sold at about 2s. each, to the value of £2,000,000. The export of silk in 1895-1896 amounted to £12,000,000, and was valued at £30,000,000.
reached a maximum in 1901 and 1900, as will be seen from the following table:

Wheat has been a valuable article of export for many years, and since about 1870 large quantities of boxwood have also been exported thence; in some years the value of the timber and boxwood exported has exceeded £50,000. This value represented about 200,000 box trees and quite as many others. Much zinc is also used for charcoal-burning, and occasionally large parts of forest are burned by the people in order to obtain clearings for the cultivation of rice. The destruction of the forests by timber-cutters and charcoal-burners has been allowed to go unchecked, and the resulting loss to the country has been considerable. Indiscriminate cutting has occasionally been confined within certain bounds, but such restrictions were generally either of short duration or made for the convenience and profit of a few. The forests of Kandahar, Luristan and the Bakhtiari district are also being rapped thin. A small step in the right direction was made in 1900 by engaging the services of an official of the Prussian forest department, but unfortunately, beyond the Jajrud and Jazir valley plantations the forests have been cut down to the Crown, and employing him to lay out small plantations in the Jajrud valley, east of Teheran, nothing was done. The monopoly for cutting and exporting the timber of the Mazandaran forests is leased to British firms, particularly for our oak, poplar, aspen, and oak crop has become scarce. There are many kinds of good timber-yielding trees, the best known being alder (Alnus glutinosa), Wild, & A. barbata, A. cordifolia, Ten. ash (Fraxinus excelsior, L.), beech (Fagus sylvatica), elm (Ulmus campestris, U. effusa, U. pedunculata), yew (Taxus baccata, T. baccata), juniper (Juniperus excelsa, J. communis, J. sabina), maple (Acer insignis, Boiss., A. campesire, A. pseudo-platanus, L.), oak (Quercus ballota, Q. castaneaefolia, Q. sessitifila, Q. pedunculata), walnut, nettle tree (Celtis australis, L.), Siberian elm (Zizia crenata, Spach.), and various kinds of poplar. Pipe-sticks, from the wild cherry tree, are exported to Turkey.

Fisheries.—Fish is a staple food along the shores of the Persian Gulf and the Caspian Sea. The Crown also has a number of fisheries, the fisheries of the Caspian littoral are leased to a Russian firm (since 1868), and most of the fish goes to Russia (31,120 tons, value £55,125, in 1906-1907). The fish principally caught are eel, mullet, sole, pollock, for silvery, blue, and perch.

Minerals and Mining.—Persia possesses considerable mineral riches, but the absence of cheap and easy means of transport, and the scarcity of fuel and water which prevails almost everywhere, make any exploitation on a remunerative scale impossible, and the attempt to develop mining operations must be considered a failure. The capital and under European supervision have been unsuccessful. Deposits of rich ores of copper, lead, iron, manganese, zinc, nickel, cobalt, &c., abound. A few mines are worked by native capital, in a primitive, systemless manner, and without any great outlay of capital. There are turquoise mines near Nishapur (for description of mines, manner of working, &c., see A. Houtum-Schindler, Report on the Turquoise Mines in Khorasan, F. O. Reports, 1884, and "Die Gegenwart zwischen Schahar und Meschedh"), Jährbuch k. k. geol. R. A. Wien, vol. xxxvi.; also E. Tiegel, Verhandl. k. k. geol. R. A., 1884, p. 93); several copper mines in Khorasan, Saman, Azerbaijan and Kermán; some lead, two considerably argiferous, in Khorasan and Astarab (province of Karun and Angan, Astarah (both west of Zenjan), and Kermán; two of iron at Mesula in Gilan and Nur in Mazandaran; two of opium in Astarah and near Urmia; one of coal at Kamsar (near Kashan); one in Alum in Kermán (near Kerman); and a number of coal in the Lar district, north-west of Teheran, and at Hā and Abyīn. The worst coal is imported from England.

There are also many quarries of rock-salt, gypsum, lime and some of marble, alabaster, soapstone, &c. The annual revenue of the government from the leases, rents and royalties of mines does not exceed £20,000, and about £45,000 is derived from the turquoise mines near Nishapur. As the rents and royalties, excepting those on the leases, amount to about one-fifth of the net proceeds, it may be estimated that the value of the annual government proceeds does not exceed £50,000. The intrinsic value of the ore, particularly those of lead, iron, cobalt and nickel, which have not yet been touched can be estimated at millions. There are also some very rich coal seams in eastern Persia, far away from the fringe of the desert, and under existing conditions quite valueless. The richest deposits of nickel, cobalt and antimony ores are also situated in localities where there is little prospect of their being worked. Auriferous alluvial strata have been discovered in various localities, but everywhere the scarcity of water has been a bar to their being exploited with profit. A rich naptha-bearing zone stretches from the Luristan hills near Kermánshâh down to the Persian Gulf. Geologists have declared that the naptha beds in the Bakhtiari hills, west of Shushtar, would give excellent results, but the difficult hilly country and the total absence of roads, as well as the antipathy of the inhabitants of the district, would make the construction of an all-weather road one of the most difficult matters. A British syndicate has been boring at several places in the zone since 1903.

Commerce.—The principal centres of commerce are Tabriz, Teheran, Mashhad, and Shemakka. Great Britain, Belgium, Russia, Austria, Germany, and France are the principal foreign countries with which Persia has trade relations. There are no barriers to trade, excepting with India, which is a member of the British Empire. Other countries which do not form a part of the British Empire, such as the United States, France, Russia, and Sweden, trade largely with Persia.

The imports and exports during the year 1906-1907 (value £14,526,234) were distributed as follows (value in thousands of pounds sterling):

While the value of the trade between Great Britain and Persia in 1906-1907 was almost the same as in 1897, that of the trade with Russia had increased from £1,800,000 to £1,850,000. The average yearly value of the trade between Great Britain and Persia during the six years was £2,952,155 (imports £2,435,016, exports £517,169); between Russia and Persia £1,825,866 (imports £739,072, exports £1,086,794). The average value of the trade with other countries was: France £666,000, Austria £246,000, Germany £124,000, Italy £79,000, United States of America £52,000, Netherlands £39,000. Other countries, £97,000.

Shipping and Navigation.—Shipping under the Persian flag is restricted to vessels belonging to the Persian Gulf ports. Some of the larger craft, which are called baghyh, and vary from 50 to 300 tons, carry merchandise to and from Bombay, the Malabar at
kept in dinars, formerly a gold piece, now an imaginary coin τραβίζιον of a kran. Ten thousand dinars are equal to one tuman (a word meaning ten thousand), or 10 krans silver, and 50 dinars are one shah.

Gold coins are: ¼, ½, 1, 2, 5, and 10 toman pieces; but they are not in circulation as current money because of their ever-varying value in silver krans, which depends upon the exchange on London. The unit of weight is the miskal (71 grains), subdivided into 28 nakhdah (29-96 grains), a nakhd being further subdivided into 4 gandum (74 grains). Larger weights, again, are the sir (16 miskals) and the abbasi, wakhek, or kervankeh (5 sir). Most articles are bought and sold by a weight called batman, or man, of which there are several kinds, the principal being:

| Man-1-Tabriz = 8 abbas  | 640 miskals = 6-49 lb |
| Man-1-Noh abbasi = 9 abbasi = 720  | = 7-30 |
| Man-1-Kohnhe (the old man) = 1000  | = 10-14 |
| Man-1-Shah = 2 Tabriz mans = 1280  | = 12-98 |
| Man-1-Key = 16 mans = 2560  | = 25-96 |
| Man-1-Mander abbasi = 840  | = 8-52 |
| Man-1-Hashemi = 16 mans = 720  | = 11-80 |

Corn, straw, coal, &c., are sold by kharvar = 100 Tabriz mands = 42-80 lbs.

The unit of measure is the zar or gez, of which, as in the case of the man, there are several variants. 40-95 in. is the most common length for the zar, but in Azerbaijan the length is 44-09 in. Long distances are calculated in farsaks, a farsakh being equal to 6000 gezes or 2-7 meters. The deprecation in the coinage made the farsakh 3-87 m., but the other length of the zar is sometimes used, when the farsakh becomes 4-17 m. Areas are measured in jeribs of from 1000 to 1666 square zar of 49-95 in., the surface unit thus ranging from 1294 to 1379 sq. yds.

**Constitution and Government.**—Up to the year 1906 the government of Persia was a despotistic monarchy, and resembled in its principal features that of the Ottoman Empire, with the exception, however, that the monarch was not the religious head of the community. The powers of the Shah (Shahanshah), or "king of kings") over his subjects and their property were absolute, but only in so far as they were not opposed to the shari'a, or "divine law," which consists of the doctrines of the Mahomedan religion, as laid down in the Koran, the oral commentaries and sayings of the Prophet, and the interpretations by his successors and the high priesthood. In 1905, however, the people began to demand judicial reforms, and in 1906 cried out for representative institutions and a constitution. By a rescript dated the 5th of August Muzaffar-ud-Din Shah gave his assent to the formation of a national council (Majlis i shara i milis), to be composed of the representatives of the various classes: princes, clergy, members of the Kajar family and tribe—chiefs and nobles, landowners, agriculturists, merchants and tradesmen. By an ordinance of the 10th of September the number of members was fixed at 162 (60 for Tehran, 102 for the provinces) to be raised to 200 if necessary, and elections were held soon after. Electors must be males and Persian subjects of not less than 25 years of age and of good repute. Landowners must possess land of at least 1000 tomans (£200 in value, merchants and tradesmen must have a fixed and well-known place of business or shop with an annual value of not less than the average values in the localities where they are established. Soldiers and persons convicted of any criminal offence are not entitled to vote. The qualifications for membership are knowledge of the Persian language and ability to read and write it and good repute in the constituency. No person can be elected who is an alien, is under the age of 30 years or over the age of 70 years, is in the employ of the government, is in the active service of the army or navy, has been convicted of any criminal offence, or is a bankrupt.

On the 7th of October the national council, or as many members of it as could be got together, was welcomed by the shah and elected a president. This was considered as the inauguration and formal opening of parliament. An ordinance signed by the shah declared the law of 1835 to be the constitution of Persia and gave the National Council the power of enacting laws.

---

1 By article v. of the Treaty of Gulistan of 1813, confirmed by article vii. of the Treaty of Turkamanchai of 1826, it was declared that Russia did not recognize the right of maintaining war on the Caspian, and that no other Power should fly the military flag on that sea; and by a decision of the council of the Russian Empire, published on the 24th of November 1869, the establishment of companies for the navigation of the Caspian, except by Russian subjects, and the purchase of shares of such companies by foreigners were prohibited. (State Papers, vol. xiii. 925.)

2 We see this title in its old Persian form, Khāhāyātīya Khshayā-ki. In the cuneiform inscriptions: as Bābūr Bābūr, on the coins of the Parthian period, and as the Pahlavi Mithra-Mithra on the coins in the inscriptions of the Sassanians. With the Mahomedan conquest of Persia and the fall of the Sassanians the title was abolished; it was in use for a short time during the 10th century, having been granted to Shah Ismail Samani by the Caliph Motaddi A.D. 900; it appeared again on coins of Nadir Shah, 1736-1747, and was assumed by the present dynasty, the Kajars, in 1799.

---

**Government.**—The British shipping amounted to 89-2% of the total shipping at the four ports during the years 1904-1907. There was no German shipping in the gulf before 1906, but in the first year of its appearance (1906-1907), its tonnage at the gulf ports was almost equal to that of all other nations with the exception of Great Britain.

The shipping of 1906-1907 was distributed among the four ports as follows:

<table>

The navigation is a state monopoly, leased out for £25 per annum.

**Coinage, Weights, Measures.**—The monetary unit is the kran, a silver coin, formerly weighing 28 nakhdah (88 grains), now reduced to 26 nakhdah (77 grains), and now weighing only 24 nakhdah (71 grains). Before the coinage reform (1877) the proportion of pure silver was from 92 to 95%; subsequently the proportion was for some time 90%; now it is about 85%. In consequence of this depreciation of the coinage value, the fall in the price of silver partly also in consequence of exchange transactions by banks, the value of the kran has since 1895 rarely been more than 4-80d., or half what it was in 1874, and fell to less than 4d. in 1905. In 1874 the kran was worth a franc; in June 1908 the exchange for a £1 bill on London was 50 krans which gives the value of 1 kran as 4d. Taking this value of the kran, the values of the various nickel and silver coins in circulation work out as—:

**Nickel Coins.**

<table>
<thead>
<tr>
<th>Shahi = 1 pul = .024d.</th>
<th>Silver Coins.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two shahis = 1 kran = .048d.</td>
<td>Five shahis = 1 kran = 1.20d.</td>
</tr>
<tr>
<td>One kran = 20 shahis = 40 pul = .480d.</td>
<td>Two kran = .960d.</td>
</tr>
</tbody>
</table>

In 1899 from 80 to 83 copper shahis (weighing about ¾ lb) were being given for one silver kran. This was owing to the depreciation of the copper coinage from 1896 onwards, consequent upon there being an excess of coinage due to the excessive quantities formerly put in circulation from the mint. Accordingly the government in 1900 replaced the copper by a nickel coin (face value of nickel coin in circulation end of 1907, 4,000,000 krans). Accounts are...
by Muzaffar-ud-Din Shah, Mahammed Ali Mirza (his successor) and the grand vizir, on the 30th of December 1906, deals with the rescript of the 4th of August, states the powers and duties of the national council and makes provision for the regulation of its general procedure by the council itself. The members have immunity from prosecution except with the knowledge of the national council. The publicity of their proceedings except under conditions accepted by the council is secured. Ministers, or their delegates may appear and speak in the national council and are responsible to that body, which also has special control of financial affairs and internal administration. Its sanction is required for all territorial changes, for the alienation of state property, for the granting of concessions, for the contracting of loans, for the construction of roads and railways, for the ratification of treaties, &c. There was to be a senate of 60 members of whom 30 were to be appointed to represent the shah and 30 to be elected on behalf of the national council, 15 of each class being from Tehran and 15 from the provinces (the senate, however, was not immediately appointed).

By a rescript dated February 2, 1907, Mahommmed Ali Shah confirmed the ordinance of the 30th of December, and on the 8th of October 1907 he signed the final revised constitution, and took the oath which it prescribes on the 12th of November in the presence of the national council.

In accordance with the constitution the shah must belong to the Shahi faith, and his successor must be his eldest son, or next male in succession, whose mother was a Kajar princess. The shah's civil list amounts to 500,000 tomans (£100,000).

The executive government is carried on under a cabinet composed of seven or eight vizirs (ministers), of whom one, besides holding a portfolio, is vizir azam, prime minister. The vizirs are the ministers of the interior, foreign affairs, war, justice, finance, commerce, education, public works.

Until 1906 the shah was assisted in the task of government by two or three vizirs, some or all of whom were heads or heads of departments somewhat on European lines, and a "grand cadi of state," composed of some ministers and other members nominated by the shah himself as occasion required. Many of the "ministers" would have been considered in Europe merely as chiefs of departments of a ministry, as, for instance, the minister for Crown buildings, that for Crown domains, the minister of ceremonies, those for arsenals, army accounts, &c.; also an accumulation of several offices without any connexion between their functions, in the hands of a single person, not infrequently a grand vizir, a departure from the European model. The ministers were not responsible to the Crown in a way that ministers of a European government are: they rarely took any initiative, and generally referred their affairs to the grand vizir or to the shah for final decision.

There were twenty-seven vizirs (ministers), but only some of them were consulted on affairs of state. The departments that had a vizir on their head were the following: court, ceremonies, shah's secretarial department, interior, correspondence between court and governors, revenue accounts and budget, finance, treasury, outstanding accounts, foreign affairs, war, army accounts, military service, justiciary, mines and industries, external culture and Crown domains, Crown buildings, public works, public instruction, telegraphs, posts, mint, religious endowments and pharmaceutical customs, press. In addition to these twenty-seven vizirs, with portfolios, there were some titular vizirs at court, like Vizir of Instructions to the Imperial Presence, Vizir of Mokhtasir (extraordinary minister) &c., and a number in the provinces assisting the governors in the same way as the grand vizir. Most of these ministers were placed under the new constitution, and the heads of subsidiary departments are entitled mudir or rais, and are placed under the responsible ministers.

Religion.—About 9,000,000 of the population are Mahomedans of the Shahi faith, and 800,000 or 900,000, principally Kurds in north-western Persia, are said to belong to the other great branch of Islam, the Sunni, which differs from the former in its doctrine and mystical belief, and is the state religion of the Turkish Empire and other Mahomedan countries. Other religions are represented in Persia by about 80,000 to 90,000 Christians (Armenians, Nestorians, Greek Orthodox and Roman Catholics, Protestants), 36,000 Jews, and 9000 Zoroastrians.

Society in Persia, being based almost exclusively on religious law, is much as it was in Biblical times among the Jews, with this difference, however, that there exists no sacraldostate. In Persia any person capable of reading the Koran and interpreting its laws may act as a priest (mu'llakh), and as soon as such a priest becomes known for his just interpretation of the shor' and his superior knowledge of the traditions and articles of faith, he becomes a mujtahid, literally meaning "one who strives" (to acquire knowledge), and is a chief priest. The mu'llahs are referred to in questions concerning religious law, hold religious assemblies, preach in mosques, teach in colleges, and are appointed by the government as judges, head-preachers, &c. Thus the dignitaries, whose character seems to us specially a religious one, are in reality doctors, or expounders and interpreters of the law, and officiating ministers charged with the ordinary accomplishment of certain ceremonies, which every other Mussulman, "true believer," has an equal right to fulfil. Formerly there were only four or five mujtahids in Persia, now there are many, sometimes several in one city—Teheran, for instance, has ten; but there are only a few whose decisions are accepted as final and without appeal. The highest, and only authoritative in the mu'llakh who resides at Kerbela, or Nejef, near Bagdad, and is considered by many Shi'ites as the vicegerent of the Prophet and representative of the imam. The shah and the government have no voice whatever in the matter of appointing mu'llahs or mujtahids, but frequently appoint sheikhs-ul-islam and cadis, and occasionally chief priests of mosques that receive important subsidies out of government funds. The chief priest of the principal mosque of a city, the masjidi jami', is called imam juma', and he, or a representative appointed by him, reads the khutba, "Friday oration," and also preaches. The reader of the khutba is also called khalil. The leader of the prayers in a mosque is the pishnamas, and the crier to prayers is the mu'assim. Many priests are appointed guardians of shrines and tombs of members of the Prophet's family (imams and tawazudehs) and are responsible for the proper administration of their endowments. The guardians of a shrine is called mutavali, or, if the shrine is an important one with much property and many attendants, mutavali-baziki, and is not necessarily an ecclesiastic, for instance, the guardianship of the great shrine of Imam Reza in Meshed is generally given to a high court functionary or minister as a reward for long services to the state. In the precincts of a great shrine a malefactor finds a safe refuge from his pursuers and is lodged and fed, and from the security of his retreat he can arrange the ransom which is the purchase of his immunity when he comes out.

Formerly all cases, civil and criminal, were referred to the clergy, and until the 17th century the clergy were subordinate to a kind of chief pontiff, named sadr-us-sadur, who possessed a very extended jurisdiction, nominated the judges, and managed all the religious endowments of the mosques, colleges, shrines, &c. Shah Selim (1560-1574), in order to diminish the influence of the clergy, appointed two such pontiffs, one for the court and another for the other for the people. Nadir Shah (1736-1747) abolished these offices altogether, and seized most of the endowments of the ecclesiastical establishments in order to pay his troops, and, the lands appropriated by him not having been restored, the clergy have never regained the power they once possessed. Many members of the clergy, particularly those of the higher ranks, have very liberal ideas and are in favour of progress and reforms so long as they are not against the shor', or divine law; but, unfortunately, they form the minority.

The Armenians of Persia, in so far as regards their ecclesiastical state, are divided into the two dioceses of Azerbaijan and Isfahan, and, since the late troubles in Turkey, which caused many to leave that country, have increased in number over 50,000. About three-fifths of this number belong to the diocese of Azerbaijan, with a bishop at Tabriz, and reside in the cities of Tabriz, Khul, Selmas, Urmia and Maragha, and in about thirty villages close to the northern frontier; the other two-fifths, under the diocese of Isfahan, with a bishop in Julfa, reside in Teheran, Hamadan, Julfa, Shiraz, Bushire, Resht, Enzeli and other towns, and in some villages in the districts of Chahar Mahal, Feridan, laran, Boroujad, Kamarah, Kazan, Khajaran, &c. Many Persian Armenians are engaged in trade and commerce, and some
their merchants dispose of much capital, but the bulk live on the proceeds of agriculture and are poor.

The Nestorians in Persia, all living in cities and villages close to the Turkish frontier, numbered about 25,000 to 30,000, but many of these had migrated to the two and two-thirds thousand who went over to the Greek Orthodox (Russian) Church, in consequence of the unsatisfactory protection afforded them by their patriarch, who resides in Mosul. These latter are now cared for by an archimandrite of the Russian Church and Rector of a Persian priory.

The Greek Orthodox Catholics are represented by Russians, who reside in northern Persia; they have a church at the Russian legation in Teheran, and another at the Russian consulate in Tabriz.

The Nestorians, in Persia and within the provinces (mostly Armenians), number about three or four thousand, and have churches in Teheran, Julfa and Azerbaijan, served by members of the French Lazarist Mission. They also have some orphanages, schools and didactic dispensaries, under the care of sisters of charity of St. Vincent de Paul.

The Protestants, Europeans and natives (converted Armenians and Nestorians), number about 6500. The religious missions ministering to their spiritual welfare are: (1) the board of foreign missions of the Church of England, which has six establishments in Persia: Isfahan since 1835, Teheran since 1872, Tabriz since 1873, Hamadan since 1880, Resht since 1901 and Kazvin since 1903. The establishment of Tabriz and Isfahan are of the Western Mission. Those of Teheran, Hamadan, Resht and Kazvin the Eastern Persian Mission. The former mission has 24 churches, 118 schools, 2 hospitals and 4 dispensaries; the latter has 4 churches, 11 schools, 2 hospitals and 4 dispensaries. (2) The Church Missionary Society training mission for a Persian priest in 1808 it had 4 places of worship (Julfa, Isfahan, Kermán and Shiraz), 5 schools (Julfa, Isfahan, Yezd, Kermán and Shiraz). There are also hospitals and dispensaries for men and women at Julfa, Isfahan, Yezd and Kermán. The Julfa hospital and Isfahan have 24 beds. At Kazvin, Isfahan and Hamadan in 1880. It has in Teheran a church and a school, at Isfahan a school and at Hamadan a small school. (3) The British and Foreign Bible Society has been represented at Isfahan since 1879.

The Jews in Persia number about 36,000, and are found in nearly all the cities of the country, but communities with synagogues and priests exist only in the larger cities like Teheran, Isfahan, Yezd, Shiraz, Hamadan and Kashan. The Zoroastrians, commonly called "gharb," numbering about 9000, reside principally in the cities and villages of Yezd and Kermán, and only three or four hundred live in Teheran, Kashan, Isfahan, Isfahan. Some of the latter have engaged in commerce, and most of them employed in agricultural work and gardening. Their interests are attended to by a delegate who is appointed by the Bombay Parsi and resides at Teheran.

The non-Musulman Persian subjects, particularly those in the provinces, are much neglected, but since 1873, when Nasru 'd-Din Shah returned to Persia from his first journey to Europe they have been treated more liberally. In cities where many non-Musulman subjects reside a special official is appointed to protect them, and the ministers of justice is under the bishop of Julfa and Isfahan to look after them and see that they are protected against fanaticism and injustice.

Instruction.—Primary schools, mahal (where Persian and a little Arabic, sufficient for reading the Koran, and sometimes also a little arithmetic, are taught to boys between the ages of seven and twelve), are very numerous. These schools are private establishments, and under no supervision whatever. The curriculum for the first three years includes reading, writing, and recitation a month for each child. Colleges, madrasah, (where young men are instructed, fed, and frequently also lodged gratuitously), exist in nearly every town. Most of them are attached to mosques, and the teachers are members of the clergy, and receive fixed salaries out of the college funds. The students are instructed in Arabic and Persian literature, religion, interpretation of the Koran, Moslem law, logic, rhetoric, philosophy and other subjects necessary for admittance to the clergy, for doctors of law, &c., while modern sciences are neglected. Families who have means and do not desire their children to become members of the clergy, employ private tutors, and several have latterly obtained the services of English and French professors to educate their children, while others send their boys to school in England, France, Germany and Russia. At the beginning of Nasru 'd-Din Shah's reign, a public school on the lines of a French lycée was opened in Teheran, principally with the object of educating officers for the army, but also of introducing a knowledge of Western science and languages, and a ministry of public instruction was created at the same time. Military and civilian teachers were obtained from Europe, and the state granted a large sum of money for the support of the establishment. The tuition is gratuitous, and the pupils are clothed and partly fed at government expense. Some years later a similar school, but on a much smaller scale, was opened in Tabriz. After a time the annual grant for the support of these two schools was reduced, and during the years 1890–1908 amounted to only £5000. The average number of pupils was about 250, and until the beginning of 1899 these two schools were the only establishments under the supervision of the minister of public instruction. Soon after his accession in 1895 Muzaffar-ad-Din Shah expressed a desire that something more should be done for public instruction, and in the following year a number of Persian notables formed a committee and opened some schools in Teheran and other places in the beginning of 1898. A year later the committee, until then private establishments, were placed under the minister of public instruction. The new schools at Teheran have from 1000 to 1400 pupils.

A German school with an annual grant of £2400 from Persia and of £1000 from Germany was opened at Teheran in 1907. There is also established a French school under the auspices of the Alliance Française. Much has been and is being done for education by the Armenians and the Protestant and Roman Catholic missions in Persia, and a large percentage of the pupils is composed of Musulmans. The Alliance Israelite has opened a school in Teheran. In 1907 the American Protestant mission had 129 schools with 3423 pupils, the English Protestant mission had 5 schools with 425 pupils, the Roman Catholic mission (Lazarist) had 3 schools with 400 pupils, and the Armenians had 4 schools and 646 pupils. All these schools are supported by voluntary subscriptions and donations.:

Army.—Persia had no regular army until 1873, when some regiments of regular infantry (sarbas) were embodied and drilled by the first French military mission to Persia under General Gardane. Since then seven other military missions (two British, two French, two Austrian, and one Russian) have come to Persia at the request of the Persian government, and many officers and non-commissioned officers, and even civilians, of various nationalities, have been engaged as army instructors. The last serious attempt to reorganize the Persian army was made in 1879, when the second Austrian mission formed the "Austrian corps" of seven new battalions of 800 men each. These new battalions were disbanded in 1882. The Russian mission of 1879 has been the most successful, and the so-called "Cossack brigade" which it formed has always been commanded by Russian officers. The brigade has a strength of about 1800 men and costs £50,000 per annum. The total annual expenditure for the army amounts to about one-third of the total revenues of the government.

According to statistics published for 1905 the Persian army has an effective force of about 91,000 men, but the number of men actually serving with the colours does not exceed 35,000:

Navy.—The Persian government possesses nine steamers. One is the "Nasru 'd-Din," an old yacht of about 120 tons, presented in the 'seventies by the emperor of Russia, and stationed at Enzeli, the port of Resht. The others, all employed in the customs service in the Persian Gulf, are the following: The "Persepolis," built 1884, 600 tons, 450 h.p., with three 7c. and one 8c. Krupp. The "Susa," built 1884, 36 tons, with one Krupp. An old Belgian yacht "Selika," purchased 1903 and renamed "Muzafferig," with two Hotchkiss guns. Five launches built in the Royal Indian Marine Docks, Bombay, in 1905, at a cost of 60,000 rupees each, of about 80 tons.
JUSTICE: FINANCE

PERSIA

Justice.—By the theory of a Mahomedan state there should be no other courts of justice except those established for the administration of the šar, the "divine or written law," but in Persia there is another judicature, which is called 'urf and repre- sentatives, known as šāhs (heads), members of the state and therefore, is administered by the shah and his representatives according to one law and by the clergy according to another, but the decisions of the former must not be opposed to the fundamental decision of the shah, for the former are the constructors of the law of justice are the governors and other officials already mentioned. The officials charged with the administration of justice according to the šar are judges, called sheikh-ul-islam and jesi azani, ministers of the shah, who are appointed by the government and receiving a fixed salary, but some cities are without regular appointed judges and the title of card is almost obsolete; decisions according to the šar are given by a body of men, known as the interrogators, representing little villages and cantons to learned mujahids of the great cities. If the parties to the suit are dissatisfied with the judgment, they may appeal to a priest who stands higher in public estimation, or to one of the higher clergy or by bribery to quash the judgment of the first. Unfortunately, many members of the clergy are corrupt, but the mujahids, as a rule are honest and entirely trustworthy. The functions of the representatives of the 'urf are not so well defined, while in the case of equality of civil are referred to the 'urf, which, however, also takes cognizance of the decisions of the clergy, and should be selected with care.

In criminal cases the dispensation of justice is always summary, and the results are as a rule contrary to the rights of individuals, and the punishment, a bastinado, is a matter of some minutes. For commercial cases, not paying a bill in time, bankruptcies, &c., a kind of sequestration, allowing in the property of the defaulter or a board of merchants, but the decisions of the minister, or those of the board, are rarely final. In Teheran the board of merchants is presided over by the malik ul tuğer, "King of Merchants," in the provincial cities by a person called malik amin, and masin of merchants.

After his second journey to Europe in 1878 Nasru'd-Din Shah desired to organize a police for the whole of Persia on the European system. The body of officials, in the capital and the nearest immediate neighbourhood, was created in 1879. This new force was 60 mounted police and 190 foot, with 11 superior and 40 subaltern officers.

The "Tribunal of the Ministry for Foreign Affairs," presided over at Teheran by an official of the foreign office, and in the provincial cities by the kargusars, "agents," of that department. The functions of this tribunal are to inquire into and judge differences and suits between Persian subjects and foreigners, and it is summary in the case of suits, while in all cases of existing treaties between Persia and other countries, that suits shall only be examined and judged according to the provisions of the contract or consulate arrangement or as the case may be, and the duties of the former shall not give cause to a second inquiry. If, however, circumstances should be of a nature to require a second inquiry, it shall not take place without previous notice given to the minister, or the foreigner, or the consul, or that of the consul, and the suit shall only be proceeded with at the supreme chancery of the shah at Tabriz or Teheran, likewise in the presence of a dragnaman of the mission, or of the consulate. (Article vii.)

A foreign subject may not be put in a civil suit cannot be pursued or molested in any way unless there exist full proofs of his being actually part taken in the crime imputed to him, and should he be duly convicted of the crime, he is handed over to his legal, which either delivers him to his own country, to undergo the punishment established by law, or, according to more recent usage, punishes him in Persia by fine, imprisonment, &c., and in this respect the powers of the foreign representatives in Persia, now numbering 31, are almost equal. The diplomatic relations with Russia, Germany, United States of America, Italy, Belgium, and the Netherlands) vary considerably, some having the power of condemning a criminal to death, while others cannot do more than fine. The laws relating to the treatment of foreign subjects are altogether out of Persia jurisdiction, and are judged by the representatives of the foreign powers accredited to Persia.

Finance.—The fixed revenues of Persia are derived from (1) regular taxation (maliat) composed of taxes on lands, flocks, herds, shepherds, artisans and trade; (2) revenues from Crown lands; (3) customs; (4) rents and leases of state monopolies. There is also a kind of irregular revenue derived from public requisitions, presents, fines, confiscations, &c., nowadays not producing much. The land tax, which varies according to localities, is paid in money and kind, and should amount on an average to about 25% of the yield of the soil. The taxation on flocks and herbs exists either as a supplementary method of land taxation, or as a contribution of a certain sum per animal, and the tax on shopkeepers, artisans and craftsmen, is at present in abeyance, and it is anticipated that it will not be imposed on the profits of the trades. The revenue from Crown lands consists of a certain proportion of the produce, and there is much variance according to localities. Until March 1899 all the taxes were paid in silver at par with the London rate of £1 to 190/., but these taxes, according to European principles, with the help of Belgian officials. By treaties with Russia and Great Britain, concluded in 1901 and 1903 respectively, the 5% duty fixed by the Turkmehani treaty was abolished, and in 1899 a 3% duty was also abolished, the duties of the profits of the landowners and the wages and profits of artisans and tradesmen, were in the years 1897 and 1898 more than double what they were in 1876, the half-yearly revenues, has hardly increased since then. In 1876 the total revenues, amounting to $8,800,000, in 1884 to $2,500,000, and in 1900 to $2,000,000, this would seem to show a steady increase, but when we consider that the value of the rouble has fallen 50%, and the fall of the depreciation of the silver to only 50%, the total revenue has increased from £1,950,000 in 1876 to £1,600,000 in 1900, and 1908. Out of the actual total revenue, £500,000 is represented by customs and £1,000,000 rent-free and £300,000 is levied on the sale of malt and revenues of Crown lands. In 1876 the two latter items amounted to about £1,600,000, while the two former were only £300,000 instead of £500,000 in 1876 and 1884. The three last years, 1895-97, the revenues of the landowners amounted to £43,000,000 (1,600,000) in 1876, and showing a decrease of over 37% in sterling money. A new assessment of the malat, based upon the present value of the produce of land and actual profits of artisans and tradesmen, has frequently been spoken of, and the most important minister of finance, as a rule, the minister of finance, ought to have no difficulty in raising the malat to its proper level and the total revenues of the country may then be considered permanent.

Until 1888 the yearly expenditure was less than the yearly income, but subsequently the revenues were not sufficient to cover the expenditure, and many payments fell in arrear in spite of emptying the customary reserve and contracting numerous loans. In May 1892 the Persian government entered into a contract with the Imperial Bank of Persia, established by British royal charter in 1889, for a loan of £500,000 at 5%, repayable in the course of forty years, and guaranteed by the customs of Fars and the Persian Gulf, and fixed at 40% of the total profits of the Persian Gulf ports, and repayable in the course of seventy-five years. In the contract, which was signed at Petersburg at the end of January 1900, the Persian government undertook to pay 8½% of the nominal capital, or £3,040,000. The bonds enjoy the full guarantee of the Russian government. The yearly charge for interest and amortization, about £124,000, is to be paid in two installments, the first on the 1st of July and the second on the 1st of January of the following year. The Persian Bank will have the right to exercise effective control of the customs with a maximum number of twenty-five European employees. When the contract for the new loan was concluded, the liabilities of the former of £1,180,000 (about £43,000,000), temporary loans from various banks, arrears of pays and salaries, and other debts, amounted to over £5,000,000, so that not much margin was left. The shah's visit to Europe in the spring of 1903 provided the Persian government with a due of about £500,000, and in June 1902 the Russian bank agreed to grant a further loan of 10 million roubles on the same conditions as those of the first loan, and the whole amount was paid by the end of the year, but another visit of the shah to Europe in 1904 made the position worse than before. After November 1903 the expenditure was reduced, and the new customs tariff which came into force on the 14th of February 1903 increased the revenue by nearly £200,000 per annum; it was thought that the expenditure would not exceed the receipts, even if the shah undertook a third voyage in Europe (which he did in 1905). However, in November 1907, when the national assembly or council demanded a budget and made inquiries as to the financial position, it was found that the expenditure for
some years past had been half a million sterling per annum in excess of the re-exports and that considerable sums were owing to banks and commercial firms who had lent money. Most of the money borrowed was at 12 to 15% interest. In October 1888 a Belgian bank (the New Oriental Bank Corporation, Limited) established itself in Persia and modern ideas of banking were introduced into the country. Until then the banking was done by the native money-changers (called sarrafs) and by the agents of the government—on the basis of the local currency, the silver kran. With the title of "The Imperial Bank of Persia" the bank was formed in the autumn of the same year, and incorporated by royal charter granted by Queen Victoria and dated the 2nd of September 1889. The authorised capital was four millions sterling, but the bank started with a capital of one million, and began its business in Persia in October 1889. In April 1890 it took over the Persian business of the New Oriental Bank Corporation, soon afterwards opened branches at Tabriz, Meshed, and Isfahan, with the object of facilitating the settlement of trade by the exchange of sterling for silver, and the bank's capital employed in Persia being reduced in value by more than one-third—100 krans, which at the beginning represented £15 per krans. In silver, at the rate of £2 sterling to the dollar, a million sterling was reduced to £650,000 in December 1894. The bank has made steady progress in spite of innumerable difficulties, and paid a fair dividend to its shareholders. In his paper on "Banking in Persia" (Journal of the Institute of Bankers, 1890), Mr. Joseph Rabino pointed out the great difficulties which make the easy distribution of funds—that is, the providing them when and where required—a matter of impossibility in Persia, and gives the reason for the great advantages of the Imperial Bank of Persia for both the exchange of sterling for silver and the issue of notes payable at the issuing branches only, "for, in a country like Persia, where movements of specie are so costly, slow and difficult as to become impracticable except on a small scale, the best way of issuing notes payable at more than one place is obvious." On the 20th of September 1907 the value of the notes in circulation was £395,000, and the bank held £550,000 deposits in Persia.

In 1890 the shah also granted a concession to Jaques de Poliakov of Sa Petersburgh for the establishment of a "loan bank," or, as the original concession said, "mont-de-piété," with exclusive rights of holding public auctions. A company was formed in the same year and started business at Tehran in 1890 as the "Banque des Prés de Perse." After continuing its operations for a few years to ordinary pawnbroking, without profits, it obtained the aid of the Russian State Bank, acquired large premises in Teheran, made advances against Persian government bonds (1898), and in January 1900 and March 1901 borrowed approximately £1,000,000 and £1,500,000 from the Russian government to Persia. It has branches at Tabriz, Resht, Meshed and other places.

Various Armenian firms, one with branches at many places in Persia and Russia, also do banking business, while various European firms at Tabriz, Teheran, Isfahan, Shiraz and Bushire, facilitate remittances between Europe and Persia.

The chief business of the native sarrafs (money-changers, bankers; &c.) is to remit money ever larger sums at rates ranging from 12% to 15% and remit money from place to place in Persia for a commission amounting to from 1 to 5%, or even 6% on each transaction, and in spite of the European banks giving lower rates of discount and reducing their margin, the native money-changers are still in favour of many classes still deal with the natives. For advances with good security a native sarraf charges at least 12% interest per annum; as the security diminishes in value the rate of interest increases, and the charge for money for a month or more may be more than 20% per annum. In some cases the Persian obtains an advance of money at less than 12% considers that he gets money "for nothing." (A. H.-S.)

Historical:

I. The Name.—"Persia," in the strict significance of the word, denotes the country inhabited by the people designated as Persians, i.e. the district known in antiquity as Persia (q.v.), the modern Fars. Custom, however, has extended the name to the whole Iranian plateau; and it is in this sense that the term Persia is here employed.

II. Ancient Ethnography.—In historical times we find the major portion of Iran occupied by peoples of Indo-European origin, terming themselves Aryans (Arya; Zend, Airyä) and their language Aryan—in the inscriptions of Darius—the same name, which is used by the consanguineous tribes of India who were their nearest relations. The whole country is designated Aria (Zend, Airyana)—"the land of the Aryans"—the original of the Middle-Persian Eran and the modern Iran; the Greek geographers Eratosthenes and Strabo were in error when they limited the name to the eastern districts of Iran. Thus the name of Iranians is understood to comprehend all these people of Aryan nationality.

Besides the Iranians, numerous tribes of alien origin were found in Iran. In Baluchistan, even yet, we find side by side with the eponymous Iranian inhabitants, who only penetrated therewith a few centuries ago, the ethnologically and philosophically distinct race of the Brahui, who are probably connected with the Dravidians of India. In them we may trace the original population of these districts; and to the same original population may be assigned the tribes here settled in antiquity: the Paricani and Gedrosi (Gadrosi), and the Myci (Herod. iii. 93, vii. 68; the Meka of Darius, the modern Mekran), to whom the name "Aethiopides" was also occasionally applied (Herod. iii. 94, vii. 70). In Media the Greek geographers mention a people of Arracae (Strabo xi. 508, 514; Pliny, Nat. Hist. vii. 34. 25; in Polyb. v. 44.9, "Arapaçæus, i.e. "Non-Aryans." To these the Tapuri, Amdari, Caspii, and especially the Cadusii or Gelae—situated in Ghilan on the Caspian—probably belonged. Presumably they were also related to the tribes of Armenia and the Caucasus. In the chains of Zagros we find, in Babylonian and Assyrian times, no trace of Iranians; but partly Semitic peoples—the Gutaeans, Lulubæans, &c.—partly tribes that we can refer to no known ethnological group, e.g. the Cossæi (see below), and in Elymais or Susiana the Elymaeans (Elamites).

That the Iranians must have come from the East to their later home, is sufficiently proved by their close relationship to the Indians, in conjunction with whom they previously formed a single people, bearing the name Arya. Their residence must have lain chiefly in the great steppe which stretches north of the Black Sea and the Caspian, through South Russia, to Turan (Turkestane) and the Oxus and Jaxartes. For here we continually discover traces of Iranian nationality. The names and words of the Scythians (Scoli) in South Russia, which Herodotus has preserved, are for the most part perfectly transparent Iranian formations, identified by Zeuss and Müllenhoff; among them are many proper names in Aric-(Aro-) and aspa (horse-asps; Zend, aspa). The predatory tribes of Turan (e.g. the Massaeans) seem to have belonged to the same stock. These tribes are distinguished by the Iranian peasants as Daha (Gr. Δανα), "enemies," "robbers"; by the Persians as Sacaee; and by the Greeks generally as Scythians.

From the region of the steppes the Aryans must have penetrated into the cultivable land of Eastern Iran; thence one part spread over the district of the Indus, then on again to the Ganges; another moved westward to Zagros and the borders of the Semitic world. Whether the period of this migration cannot yet be determined with certainty. We know only that the Aryans of India already occupied the Punjab in the Vedic era, c. 1600 B.C.

Period of Migration—In Western Asia, (cf. Edward Meyer, "Zur ältesten Geschichte der Iranier," in Zeitschrift für vergleichende Sprachforschung, 1907). In the cuneiform letters from Tell-el-Amarna in Egypt (1400 B.C.), we find among the princelings of Syria and Palestine names like Aramaeans, Arziwia, Skudarios, a name terminating in -varxaza, &c.; while the kings of Mitanni on the Euphrates are Ariakba, Shudara, Arzakuma, and Dushratta—names too numerous and too genuinely Iranian to allow of the hypothesis of coincidence. Later still, in the Assyrian inscriptions we occasionally meet with names borne by North-Syrian princes—e.g. Kudaspı
Kustaspi (= Hystaspis). Their subjects, on the contrary, speak absolutely different tongues: for the attempts to explain the languages of the Cosseans, Mattanians, and Arzapanians as Indo-European (Iranian) have ended in failure (cf. Blomfield in the American Journal of Philology, xxv. p. 1 sqq.).

It appears, then, that towards the middle of the second millennium before Christ, the Iranians made a great forward movement to the West, and that certain of their princes—at first, probably in the rôle of mercenary leaders—reached Mesopotamia and Syria and there founded principalities of their own, much as did the Germans under the Roman Empire, the Normans, Turks, &c. With this we may probably connect the well-known fact that it was about this very period (1700 B.C. approximately) that the horse made its appearance in Babylonia, Egypt and Greece, where for centuries subsequently its use was confined to war and the war-chariot. Before this it was as foreign to the Babylonians, even in the time of Khammuri, as to the Egyptians of the Aryan period and the Persians of the Achaemenian age. The horse was also known to the Scythians and the Huns, to the Aryans of central Asia, and was perhaps introduced into the Aryans from time immemorial; indeed they have always been peculiarly a people of riders. Thus it is quite conceivable that they brought it with them into Western Asia; and the quarter from which it came is sufficiently indicated by the fact that the Babylonians write the word “horse” with a group of signs denoting “ass of the East.”

Of the Assyrian kings, Shalmaneser (Salmanassar) II. was the first to take the field against the Medes in 836 B.C., and from that period onwards they are frequently mentioned in the Assyrian annals. Sargon penetrated farthest, receiving in 715 B.C. the tribute of numerous Median town-princes. He gives a list of their names, twenty-three of which are preserved either wholly or in part, and almost all are unmistakably Iranian; as is also the case with those preserved by Esar-haddon (Assarhadon) and elsewhere.

The Medes then, were an Iranian nation, already occupying in the 1st century B.C. their later home in the centre of the Median highland. On the other hand, among their neighbours in Zagros and the north—corresponding to the Anaricae (Non-Aryans) of the Greeks—Iranian names are at best isolated phenomena. With other Iranian tribes the Assyrians never came in contact: for the oft-repeated assertion, that the Parsuas, so prominent in their annals, were the Persians or the Parthians, is quite untenable. The Parsua of the Assyrians are located south of Lake Urmia, and can hardly have been Iranians.

None the less, the Assyrian statements with regard to the Medes demonstrate that the Iranians must have reached the west of Iran before 900 B.C. It is probable that at this period the Persians also were domiciled in their later home, even though we have no direct evidence to adduce. If this reasoning is correct, the Iranian immigration must be assigned to the first half of the second pre-Christian millennium.

The Aryans of Iran are divided into numerous tribes; these, again, being subdivided into minor tribes and clans. The principal, according to the inscriptions of Darius —which closely agree with Herodotus—are the following, several of them being also enumerated in the Avesta:

1. The Medes (Mada) in the north-west (see MEDIA).
2. The Persians (Parsa) in the south (see PERSIA). To these belonged the Cissians (Dahyu), which memory is expressed by Darius as inhabiting a district in Persis (Beh. III. 40).
3. The Hyrcanians (Varvānā) in Darius, Zend Vēhrkānā) on the eastern corner of the Caspian, in the fertile district of Astarabah.
4. The Parthians (Parthi; Pers. Parthā) in Khorasan (see PARTHIA).
5. The Arians (Ares, Pers. Haraita), in the vicinity of the river Arius (Hērt-rud), which derived its name from them. This name appears in the western Herat, has of course no connexion with that of the Aryans.
6. The Drangians (Drangāk, Darangians) in Herod. iii. 93, 117, vii. 67), situated south of the Arians, in the north-west of Afghanistan (Arcotaka) by the western affluents of Lake Hamun, and extending to the present Seistan.
7. The Arachotians (Pers. Harawati), in the district of the Helmand and its tributaries, round Kandahar. They are mentioned in the lists of Darius, also by the Greeks after Alexander. In Herodotus their place is taken by the Pactyans, whose name survives to the present day in the word Paktu, with which the Afghans denote their language (Herod. ill. 102, iv. 44, vii. 67, 85). Probably it was the old tribal name; Archepria being the local designation. The Thamanceans, who appear in Herodotus (ill. 93, 117), must be connected with them.
8. The Bactrians (Pers. Bāhktīrī), on the northern declivity of the Hindu Kush, as far as the Oxus. Their capital was Bactra, the modern Balkh (see BAKTRIA).
9. The Sogdians (Parthyaei; or Sozgar) in the mountainous district between the Oxus and Sogdiana.
10. The Chorasmians (Khwarizmians, Pers. Varazima), in the great oasis of Khiva, which still bears the name Khwarizm. They were pushed far into the midst of the nomadic tribes.
11. The Margians (Pers. Margu; Marghīb); chiefly inhabiting the oasis of Merv, which has preserved their name. Darius mentions the district of Margu but, like Herodotus, omits the names of those tribes. It is added that ethnographically they are perhaps to be assigned to the Arians.
12. The Saragartians (Pers. Assagarta); according to Herodotus (vii. 83), a nomadic tribe of horsemen; speaking, as he expressly declares, the Persian language. Hence he describes them (i. 125) as a subordinate nomad clan of the Persians. They, with the Drangians, Uitians and Myrpi, formed a single satrap (Herod. iii. 93). Prolemy (vi. 2, 6) speaks of Saragarti in the Eastern Zagros in Media.
13. We have already touched on the nomadic peoples (Dāka, Dakans) of Iranian nationality, who occupied the steppes of Turkestan as far as the Sarmatians and Scythians of South Russia. They have left the names of their Aryan origin in the names Arianats and Ariapeithes borne by Scythian (Scotoi) kings (Herod. iv. 76, 87). They were never counted as a portion of Iran or the Iranians. To the settled peasantry, these nomads of the steppes are always referred to as “Adaianats” (Ada i was).

Side by side with this name we find “Turān” and “Turānian” (Turan). A designation applied by both the later Persians and by modern writers to this region. The origin of the word is obscure, derived perhaps from an old Aryan ending -ata or -ada, “of whatever or from what ever with the much later “Turks” who penetrated thither in the 6th century after Christ. Though found neither in the inscriptions of Darius nor in the Greek authors, the name Turan must never the less be of great antiquity; for not merely is it repeatedly found in the Avesta, under the form Tura, but it occurs already in a hymn, which, without doubt, originates from Zoroaster himself, and in which the Turanian Fravni and their descendants are consecrated as faithful adherents of the prophet (Yath. 46, 62).

The dividing line between Iranian and Indian is drawn by the Hindu Kush and the Soliman mountains of the Indus district. The valley of the Kabul (Cophen) is already occupied by Indian tribes, especially the Gandarians; and the Satagade (Pers. Thataqa) there resident were presumably also of Indian stock. The non-Aryan population of Iran itself has been described above. Of its other neighbours, we must here mention the Sacae, a warlike equestrian people in the mountains of the Pamir plateau and northward; who are probably of Mongol origin. Herodotus relates that the Persians distinguished “all the Scythians” —i.e. all the northern nomads—as Sacae; and this statement is confirmed by the inscriptions of Darius. The Babylonians employ the name Gimiri (i.e. Cimmerians) in the same sense.

III. Civilization and Religion of the Iranians.—In the period when the ancestors of Indian and Iranian alike still formed a single nation—that of the Aryans—they developed a very marked character, which can still be distinctly traced, not only in their language, but also in their religion and in many views common to both peoples. A great number of gods—Ausa, Mithras, the Dragon-slayer Varēnakhna (the Indra of the Indians), the Water-shoot Apam napat (the lightning), &c.—date from this era. So, too, fire-worship, especially of the sacrificial flame; the preparation of the intoxicating soma, which fills man with divine strength and uplifts him to the gods; the injunction to “good thoughts and good works,” imposed on the pious by Veda and Avesta alike: the belief in an unswerving order (ria)—a law controlling gods and men and dominating them all; yet with this, a belief in the power of magical formulae (mantra), exclamations and prayers, to whose compulsion not merely demons (the evil spirits of deception—dāīta, Dāiveen) are subject, but also the institution of a priesthood of fire-kindlers (ahuravas), who are at once the repositories of all sacred traditions and the mediators in all intercourse between earth and heaven. The transition, moreover, to settled life and agriculture belongs to the Aryan
period; and to it may be traced the peculiar sanctity of the cow in India and Persia. For the cow is the animal which voluntarily yields nourishment to man and aids him in his daily labours, and on it depends the industry of the peasant as contrasted with the wild desert brigand to whom the cow is unknown.

Very numerous are the legends common to both nations. These, in part, are rooted in the primeval Indo-European days, though their ultimate form dates only from the Aryan epoch. Foremost among them is the myth relating the battle of a sun-god (Ind. Trita, generally replaced by Indra, Iran. Thraeton) against a fearful serpent (Ind. Ahi, Iran. Aži; known moreover as Virata): also, the legend of Yama, the first man, son of Vivasvant, who, after a long and blessed life in the happy years of the beginning, was seized by death and now rules in the kingdom of the departed. Then come a host of other tales of old-world heroes; as the “Glorious One” (Ind. Sushrata, Pers. Haurasa, Chorsor or Chorores), or the Son who goes on a journey to seek his father (Ind. Ahi, Iran. Haurasa), etc., etc., at this end at his hands.

These legends have lived and flourished in Iran at every period of its history; and neither the religion of Zoroaster, nor yet Islam, has availed to suppress them. Zoroastrianism—though at least in that form in which it became the dominant creed of the Iranians—legitimized not only the old gods, but the old heroes also; and transformed them into pious helpers and servants of Ahuramazda; while the creator of the great national epic of Persia, Firdousi (A.D. 935-1020), displayed astonishing skill in combining the ancient tradition with Islam. Through his poem, this tradition is perfectly familiar to every Persian at the present day; and the primitive features of tales, whose origin must be dated 4000 years ago, are still preserved with fidelity. This tenacity of the Saga stands in the sharpest contrast with the fact that the historical memory of the Persian is extremely defective. Even the glory of the Achaemenid Empire faded rapidly, and all but completely, very early, so that the personages of Alexander, and the Hellenistic and Parthian eras. In Firdousi, the legendary princes are followed, almost without a break, by Ardashir, the founder of the Sassanian dynasty; the intervening episode of Darius and Alexander is not drawn from native tradition, but borrowed from Greek literature (the Alexander-romance of the Pseudo-Callisthenes) in precisely the same way as among the nations of the Christian East in the middle ages.

Needless to say, however, this long period saw the Saga much recast and expanded. Many new characters—Siyawush, Rustam, &c.—have swelled the original list: among them is King Gushtasp (Vishtasp), the patron of Zoroaster, who was known from the poems of the prophet and is placed at the close of the legendary age. The old gods and mythical figures reappear as heroes and kings, and their battles have no longer in heaven but upon earth, where they are localized for the most part in the east of Iran. In other words, the war of the gods has degenerated to the war between Iranian civilization and the Turanians. Only the evil serpent Azhi Dahaka (Azhdahak) is domiciled by the Avesta in Babylon (Bērūr) and depicted on the model of Babylonian gods and demons: he is a king in human form with a serpent growing from either shoulder and feeding on the brains of men. In these traits are engrafted the general conditions of history and culture, under which the Iranians lived: on the one hand, the contrast between Iranian and Turanian; on the other, the dominating position of Babylon, which influenced most strongly the civilization and religion of Iran. It is idle, however, to read definite historical events into such traits, or to attempt, with some scholars, to convert them into history itself. We cannot deduce from them a conquest of Iran from Babylon: for the Babylonians never set foot in Iran, and even the Assyrians merely conquered the western portion of Media. Nor yet can we make the favourite assumption of a great empire in Bactria. On the contrary, it is historically evident that before the Achaemenids there were in Bactria only small local principalities of which Vishtasp's was one: and it is possible that the primeval empire of the Saga is only a reflection of the Achaemenid and Sassanian empires of reality, whose existence legend dates back to the beginning of the world, simply because legend is pervaded by the assumption that the conditions obtaining in the present are the natural conditions, and, as such, valid for all time.

Closely connected as are the Mythology and Religion of Indian and Iranian, no less clearly marked is the fundamental difference of intellectual and moral standpoint, which has led the two nations into opposite paths of history and culture. The tendency to religious thought and to a speculative philosophy, comprehending the world as a whole, is shared by both and is doubtless an inheritance from the Aryan period. But with the Indians this speculation leads to the complete abolition of all barriers between God and man, to a mystic pantheism, and to absorption in the universal ego, in contrast with which the world becomes an unsubstantial phantom and sinks into nothingness. For the Iranian, on the contrary, practical life, the real world, and with them the moral commandment, fill the foreground.

The new gods created by Iran are ethical powers; those of India, abstractions of worship (brahman) or of philosophy (aiman). These fundamental features of Iranian sentiment encounter us not only in the doctrine of Zoroaster and the confessions of Darius, but also in that magnificent product of the Persia of Islam—the Sufi mysticism. This is pantheistic, like the Brahman philosophy. But the pantheism of the Persian is always positive,—affirming the world and life, taking joy in them, and seeking its ideal in union with a creative god: the pantheism of the Indian is negative—denying world and life, and desiring its ideal in the cessation of existence.

This contrast in intellectual and religious life must have developed very early in the remote past violent religious disputes and feuds broke out: for otherwise it is almost inexplicable that the old Indo-European word, which in India, also, denotes the gods—deva—should be applied by the Iranians to the malignant demons or devils (deva; mod. dūr); while they denote the gods by the name bhaga. Conversely the Asuras, whose name in Iran is the title of the supreme god (ahura, auro), have in India degenerated to evil spirits. It is of great importance that among the Slavonic peoples the same word bogu distinguishes the deity; since this points to ancient cultural influences on which we have yet no more precise information. Otherwise, the name is only found among the Phrygians, who, according to Hesychius, called the Heaven-god (Zeus) Bagaues; there, however, it may have been borrowed from the Persians. We possess no other evidence for these events; the only document we possess for the history of Iranian religion is the sacred writing, containing the doctrines of the prophet who gave that religion a new form. This is the Avesta, the Bible of the modern Parsee, which comprises the revelation of Zoroaster. As to the home and time of Zoroaster, the Parsee tradition yields us no sort of information which could possibly be of historical service. Its contents, even if they go back to lost parts of the Avesta, are merely a late patchwork, based on the legendary tradition and devoid of historical foundation. The attempts of West (Pahlavi Texts Translated, vol. v.) to turn to historical account the statements of the Bundahish and other Parsee books, which date Zoroaster at 258 years before Alexander, are, in the present writer's opinion, a complete failure. Jackson (Zoroaster, the Prophet of Ancient Iran, 1901) sides with West. The Greek theory, which relegated Zoroaster to the mists of antiquity, or even to the period of the fabulous Ninus and Semiramis, is equally valueless. Even the statement that he came from the north-west of Media (later Atropatene) and his mother from Rai (Rhaagae) in eastern Media, must be considered as problematic in the extreme. Our only trustworthy information is to be gleaned from his own testimony and from the history of his religion. And here we may take it as certain that the scene of his activity was laid in
the east of Iran, in Bactria and its neighbouring regions. The contrast there existing between peasant and nomad is of vital consequence for the whole position of his creed. Among the adherents whom he gained was numbered, as already mentioned, a Turanian, one Fryana and his household. The West of Iran is scarcely ever regarded in the Avesta, while the districts and rivers of the east are often named. The language, even, is markedly different from the Persian; and the fire-priests are not styled Magians as in Persia—the word indeed never occurs in the Avesta, except in a single late passage—but akharvan, identical with the ahravan of India (⇒akharvan, “fire-kindlers”) in Strabo xv. 733. Thus it cannot be doubted that the king Vishtasp, who received Zoroaster’s doctrine and protected him, must have ruled in eastern Iran; though strangely enough scholars can still be found to identify him with the homonymous Persian Hystaspes, the father of Darius. The possibility that Zoroaster himself was not a native of East Iran, but had immigrated thither (from Rhagae?), is of course always to be considered, and this has been used to explain the resemblance that the Gathas, of his own composition, are written in a different dialect from the rest of the Avesta. On this hypothesis, the former would be his mother-tongue: the latter the speech of eastern Iran.

This district is again indicated as the starting-point of Zoroastrianism, by the fact that dead bodies are not embalmed and then interred, as was usual, for instance, in Persia, but cast out to the dogs and birds (cf. Herod. i. 149), a practice, as is well known, strictly enjoined in the Avesta, ruthlessly executed under the Sassanids, and followed to the present day by the Parsees. The motive of this, indeed, is to be found in the sanctity of Earth, which must not be polluted by a corpse; but its origin is evidently to be traced in a barbaric custom of nomadic or semi-nomadic tribes who leave the dead to lie on the steppe; and we know from Greek sources that this custom was widely diffused among the tribes of eastern Iran.

The date of the Zoroastrian movement towards determining the period of Zoroaster is, that Darius I and all his successors, as proved by their inscriptions and by Greek testimony, were zealous adherents of the pure word of Zoroastrianism; which consequently must already have been accepted in the west of Iran. That Cyrus too owned allegiance to the creed, cannot be doubted by an unprejudiced mind, although in the dearth of contemporary monuments we possess no proof at first hand. The Assyrian inscriptions demonstrate, however, that Zoroaster’s teaching was dominant in Media two centuries before Cyrus. For in the list of Median princes, to which we have already referred, are two bearing the name of Mazda—evidently after the god Mazda. Now this was the name of Zoroaster himself; and he who names himself after Mazda thereby makes a confession of faith in the religion of Zoroaster whose followers, as we know, termed themselves Mazdaianas, “worshippers of Mazda.”

Thus, if the doctrine of Zoroaster predominated in Media in the 7th B.C., obviously his appearance in the rôle of prophet must have been much earlier. A more definite date cannot be deduced from the evidence at our disposal, but his era may safely be placed as far back as 1000 B.C. The religion which Zoroaster preached was the creation of a single man, who, having pondered long and deeply the problems of existence and the world, propounded the solution he found as a doctrine. Naturally he starts from the old Iranian, and is indebted to them for many of his tenets and ideas; but out of this material he builds a uniform system which bears throughout the impress of his own intellect. In this world, two groups of powers confront each other in a ruseless war, the power of Good, of Light, of creative Strength, of Life and of Truth, and the powers of Evil, of Darkness, Destruction, Death and Deceit. In the van of the first stands the Holy Spirit (spenta mainyu) or the Great Wise, the highest power and the source of all the powers of Good Thought (toku manbud, “wisdom”), of Right Order (ashka, Ind. ria, Pers. arda, “lawfulness”), of the Excellent Kingdom (kshattra-varya), of Holy Character (spenta ārman), of Health (hauvand), and of Immortality (am aantal). These are comprehended under the general title of “undying holy ones” (aemosha spenta, amshaspand); and a host of subordinate angels (yastra) are ranked with them.

The powers of evil are in all points the opposite of the good; at their head is the Evil Spirit (angro mainyu, Ahirman). These evil demons are identical with the old gods of the popular faith—the devas (diwy)—while Mazda bears the name Ahura, above discussed; while the Ahuramazda (ahuramazdata) or wise, beneficent, benefactors of the good are the bearers of the green leaves of vegetation and fertility, especially of the Oxus-stream, Anahita, Amratis (Anaitis); and the Dragon-slayer Vehrestwaza (Gr. Ariadne), with the god of the intoxicating Hauza (the Indian river); which, in the period after the six surviving; and the popularity of Mithra is evinced by the numerous Aryan proper names thence derived (Mithradates, &c.). The educated community who had embraced the pure doctrine in its earliest form was already restricted to the priests of the six surviving Gathas; and in this early stage of things the Persians ignored them. Only once he speaks of “the gods of the clans,” and once of “the other gods which there are.” Not till the time of Artaxerxes II. were Mithra and Anaitis received into the fold of the Aryan gods. Fire-worship was everywhere erected; and, to the prophet also, the Fire-kindlers (akharvan) were the ministers and priests of the true religion and the intermediaries between God and man; at last in the popular mind, Zoroastrianism was identified with Fire-worship pure and simple; but we must not forget that in reality is, as a description of its essentials.

Midway in this opposition of the powers of Good and Evil, man is placed. He has to choose on which side he will stand: he is called upon to follow the law and the truth; to fight the demons and combating the lie. And this is fulfilled when he obeys the commands of law and the true order; when he tends his cattle and fields, in contrast with the lawless and predatory nomad (Dahae); and when he spares the live being and the living—men, animals, and the devils; when he keeps free from pollution the pure creations of Ahuramazda—fire foremost, but also earth and water; and, above all, when he practises the Good and True in thought, word and deed. The Aryan at this point of the people, the spirit of the Day of Judgment; when he must cross the Bridge of Life, which, according to his works, will either guide him to the Paradise of Ahuramazda or precipitate him to the Hell of Ahirman. Obvi ously, during the course of his life, a man is exposed to the direct moral responsibility of the individual man, that, like Mahomet among the Arabs, Zoroaster and his disciples gained their adherents and exercised their greatest influence.

The chief creeds of Good three important points are especially to be emphasized: for on them depend its peculiar characteristics and historical significance:

1. The abstractions which it teaches are not products of metaphysical speculation, as in India, but rather the ethical forces of the universe, the spirit of creation, and the belief that enjoin on him a positive line of action—a definite activity in the world. This world he is not to eschew, like the Brahman and the Buddhist, but to work in it, enjoying existence and life to the full. Thus are brought into the highest of the religious conceptions the direct moral responsibility of the individual man, that, like Mahomet among the Arabs, Zoroaster and his disciples gained their adherents and exercised their greatest influence.

2. This religion grew up in the midst of a settled peasant population, whose mode of life and views it regards as the natural disposition of things. Consequently, it is at once a product of, and a cause for, the formation of a definite society; and is thereby sharply differentiated from the Israelite religion, with whose moral precepts it otherwise coincides so frequently.

3. The preaching of Zoroaster is directed to each individual man and family. It is not a system of philosophy with regard to the fundamental problems of life and religion. Thus, even though it arose from national views, in its essence it is not national (as, for instance, the Israelite creed); but individualistic, and at the same time universal. From the first, it aims at propaganda and the direct influence of the individual upon the masses. So Zoroaster himself converted the Turanian Fryana with his kindred (see above); and the same tendency to proselytize alien peoples survived in his religion. Zoroastrianism, in fact, is the first creed to work upon the masses by direct influence on the masses. It was, however, only natural that its adherents should be won, first and chiefly, among the corypnen of the prophet, and its further success in gaining over all the Iranian tribes gave it a national stamp, probably in the 9th or 8th century B.C. The translation of the Zend-Avesta was made by the Nestorian missionaries in the 5th century A.D. (see A. D. 450), preserved by the Armenian historian, Eriabé. These ideals are strongly exposed in a polemic against the Christians contained in an official edict of the Persian creed to the Armenians by Mihr Narseh, the vizier of Yazdegird II. (about A. D. 450), preserved by the Armenian historian, Eriabé.

PERSIA

[History: Ancient]

terms Ahunamaza "the god of the Aryans." Thus the creed became a powerful factor in the development of an united Iranian nationality.

That a religion, which lays its chief stress upon mortals precepts, may unfold itself into a systematized and external formalism, with an infinity of minute prescriptions, injunctions upon purity and the like, is well known. In the Avesta all these recur ad nauseam, so much so that the primitive spirit of the religion is stifled beneath them, as the doctrine of the Medes and Persians, that the soul is watched by the angels and is cleansed of its corporeal body only through the last hour of its existence, and as the Talmud. The Sassanian Empire, indeed, is completely dominated by this formalism and ritualism; but the earlier testimony of Darius in his inscriptions and the statements in Herodotus enable us still to recognize, by the side of this religious casuistry, the old fashion of worshipping the enthusiastic devotion of the inner man. Its formal character naturally germinated in the priesthood (Herod. i. 140; cf. Strabo xv. 733, &c.). The priests diligently practise all the precepts of their ritual—e.g. the extermination of noxious animals, and the exposure of corpses to the dogs and birds, that earth may not be polluted by their presence. They have advice for every contingency in life, and can say with precision when a man has been defiled, and how he may be cleansed again; they possess an endless stock of formulae for prayer, and of sentences which serve for protection against evil spirits and may be turned to purposes of magic.

How the doctrine overspread the whole of Iran, we do not know. In the West, the religious and political and external formalism is in a peculiar manner vested in an exclusive priesthood—the Medes and Persians. Whence this name—unknown as it stands alone—is of no importance, for we know no historical evidence which implies that the Medes and Persians ever contained the priestly class in their imperial organisation, and that it included any of the Median or Persian nobility. It is rather a fact that the priests were by no means as powerful or as important as in the case of the Egyptians.

The Magians.

Errors.

IV. Beginnings of History.—A connected chain of historical evidence begins with the time when under Shalmaneser (Sammanassar II.), the Assyrians in 836 B.C. began to conquer the first time to penetrate farther into the mountains of the east; and there, in addition to several non-Iranian peoples, subdued a few Median tribes. These wars were continued by the Medes and Persians, the Thracian power in the western regions, and its numerous allies, under Smerdis (q.), who (715 B.C.) led into exile the Median chief Dayuku (see Deioces), a vassal of the Minni (Mannaeans), with all his family, and subjected the princes of Media as far as the mountains of Baki (Elburz) and the border of the great desert. At that time twenty-eight Median "town-lords" paid tribute to Nineveh; two years later, (713 B.C.) no fewer than forty-six. Sargon's successors, down to Assur-bani-pal (668-626 B.C.), maintained and even augmented their suzerainty over Media, in spite of repeated attempts to throw off the yoke in conjunction with the Mannaeans, the Saparda, the Cimmerians—who had penetrated into the Armenian mountains—and others. Not till the last years of Assur-bani-pal, on which the extant Assyrian annals are silent, can an independent Median Empire have arisen.

As to the history of this empire, we have an ancient account in Herodotus, which, with a large admixture of the legendary, still contains numerous historical elements, and a completely fanciful account from Ctesias, preserved in Diodorus (ii. 32 sqq.) and much used by later writers. In the latter Nineveh is destroyed by the Mede Arbaces and the Babylonian Beles sy about 880 B.C., a period when the Assyrians were just beginning to lay the foundations of their power. Arbaces is then followed by a long list of Median kings, all of them fabulous. On the other hand, according to Herodotus the Medes revolt from Assyria about 710 B.C., that is to say, at the exact time when they were subdued by Sargon. Deioces founds the monarchy; his son Phraortes begins the work of conquest; and his son Cyaxares is first overwhelmed by the Scythians, then captures Nineveh, and raises Media to a great power. A little supplementary information may be gleaned from the inscriptions of King Nabonidus of Babylon (553-539) and from a few allusions in the Old Testament. Of the Median Empire itself we do not possess a single monument. Consequently its history still lies in complete obscurity (cf. Media; Deioces; Phraortes; Cyaxares).

The beginnings of the Median monarchy can scarcely go farther back than 640 B.C. To all appearance, the insurrection against Assyria must have proceeded from the desert tribe of the Mandaeans, mentioned by Sargon: for Nabonidus invariably describes the Median kings as "kings of the Mandaeans." According to the account of Herodotus, the dynasty was derived from Deioces, the captive of Sargon, whose descendants may have found refuge in the desert. The first historical king would seem to have been Phraortes, who probably succeeded in subduing the small local princes of Media and in rendering himself independent of Assyria. Further development was arrested by the Scythian invasion described by Herodotus. We know from Zephaniah and Jeremiah that these northern barbarians, in 626 B.C., overran and harried Syria and Palestine (cf. Cyaxares; Jews). With these inroads of the Cimmerians and Scythians (see Scythia), we must doubtless connect the great easterly and north-eastern invasion of the Achaemenids in the Indo-European Armenians (Haihik), displacing the old Aloridians (Urartu, Ararat), in the country which has since borne their name; and the entry of the Cappadocians—first mentioned in the Persian period—into the east of Asia Minor. The Scythian invasion evidently contributed largely to the enfeeblement of the Assyrian Empire: for in the same year the Chaldaean Nabopolassar founded the New-Babylonian empire; and in 606 B.C. Cyaxares captured and destroyed Nineveh and the other Assyrian cities. Syria and the south he abandoned to Nabopolassar and his son Nebuchadrezzar; while, on the other hand, Assyria proper, east of the Tigris, the north of Mesopotamia with the town of Harran (Carrae) and the mountains of Armenia were annexed by the Medes. Cappadocia also fell before Cyaxares; in a war with the Lydian Empire the decisive battle was broken off by the celebrated eclipse of the sun on the 28th of May 585 B.C., foretold by Thales (Herod. i. 74). After this peace was arranged by Nebuchadrezzar of Babylon and Sennacherib of Assyria, recognizing the Halys as the boundary. To the east, the Median Empire extended far over Iran, even the Persians owning its sway. Ecbatana (g.v.), became the capital.

Of the states which arose out of the shattered Assyrian Empire (Media, Babylon, Egypt, Cilicia and Lydia), Media was by far the strongest. In Babylon the kings feared, and the exiled Jews hoped, an attack from the Medes (cf. Isa. xiii., xiv., xxii.; Jer. i., li.); and Nebuchadrezzar sought by every means—great fortifications, canals and so forth—to secure his empire against the menace from the north. He succeeded in maintaining the status quo practically unimpaired, additional security being found in intermarriage between the two dynasties. In this state of equilibrium the great powers of Anterior Asia remained during the first half of the 6th century.

V. The Persian Empire of the Achaemenids.—The balance, however, was disturbed in 533 B.C., when the Persian Cyrus, king of Anshan in Elam (Susiana), revolted against his Median sovereign Astyages, the son of Cyaxares, and three years later defeated him at Pasargadae (g.v.). Shortly afterwards Astyages was taken prisoner, Ecbatana reduced, and the Median Empire replaced by the Persian. The Persian tribes were welded by Cyrus into a single nation, and now became the foremost people in the world (see Persis and Cyrus). At first Nabonidus of Babylon hailed the fall of the Medes with delight and utilized the opportunity by occupying Harran (Carrae). But before long he recognized the danger threatened from that quarter. Cyrus and his Persians paid little heed to the treaties which the Median king had concluded with the other powers; and the result was a great coalition against him, embracing Nabonidus of Babylon, Amasis of Egypt, Croesus of Lydia, and the Spartans, whose highly efficient army seemed to the Oriental states of great value.

In the spring of 546 B.C., Croesus opened the attack. Cyrus 1 See further, BABYLONIA AND ASSYRIA: § V. History.
flung himself upon him, beat him at Pteria in Cappadocia and pursued him to Lydia. A second victory followed on the banks of the Pactolus by the autumn of 546 Sardis had already fallen and the Persian power advanced at a bound to the Mediterranean. In the course of the next few years the Greek littoral towns were reduced, as also the Carians and Lyceans. The king of Cilicia (Syennesis) voluntarily acknowledged the Persian suzerainty. In 539 Nabonidus was defeated and Babylon occupied, while, with the Chaldean Empire, Syria and Palestine also became Persian (see JEWs). The east of Iran was further subdued, and, after Cyrus met his end (529 B.C.) in a war against the eastern Nomads (Dahae, Massagetae), his son Cambyses conquered Egypt (525 B.C.) Cyrus and the Greek islands on the coast of Asia Minor also submitted, Samos being taken by Darius. On the other hand, an expedition by Cambyses against the Ethiopian kingdom of Napata and Meroe came to grief in Nubia. The usurpation of Smerdis (522-521 B.C.) and his death at the hands of Darius was the signal for numerous insurrections in Babylon, Susiana, Persia, Media, Armenia and many of the Eastern provinces. But, within two years (521-519), they were all crushed by Darius and his generals.

The causes of this astonishing success, which, in the brief space of a single generation, raised a previously obscure and seceded tribe to the mastery of the whole Orient, can only be partially discerned from the evidence at our disposal. The decisive factor was of course their military superiority. This superiority consisted of the Persians' monopoly of the horse, which accordingly the king himself holds in his portraits, e.g. on the Behistun rock and the coins (darii). In addition to the bow, the Persians carried short lances and short daggers. But their real weapon was the horse, for it enabled them to cover a greater distance in the same time than the Persians, and so outwit them. The Persians were defeated and dwelt there under a hail of arrows, and never allowed him to come to close quarters. While the infantry kneeled to shoot, the cavalry discharged their lances. The Persians were thus enabled to scatter their lines to the very heart of the enemy's army and to complete their discomfiture by a vigorous pursuit. In a charge the infantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use the bow unhindered.

Consequently, only a few distinguished warriors wore shirts of mail. For purposes of defence the rank and file merely carried a light hide-covered shield; which the infantry, in shooting, planted before them as a sort of barrier against the enemy's missiles. Thus the Persian army was a sort of a heavy machine of horse archers, who needed in gaining their lines. In spite of all their bravery, they succumbed to the Greek phalanx, when once the generalship of a Miltiades or a Pausanias had brought matters to a hand to hand conflict; and it is worth noticing that this events were decided by the superiority of the Greek armament, the archers being the chief instrumentalities in this event. In the latter case they were employed as the archers, and the Persians were defeated and dwelt there under a hail of arrows, and never allowed him to come to close quarters. While the infantry kneeled to shoot, the cavalry discharged their lances. The Persians were thus enabled to scatter their lines to the very heart of the enemy's army and to complete their discomfiture by a vigorous pursuit. In a charge the infantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use the bow unhindered.

To all this should be added the superiority of their leaders; Cyrus especially must have been an exceedingly able diplomatist. Obviously, also, he must have understood the art of organizing his people and arousing the feeling of nationality and the courage of self-sacrifice. In his time the Persians were a strong many-peoples, the Persians many peoples of the semi-orient, a fact which can be assumed from the very name of Persis, which was a word used to denote the Persian nation, and which in the case of both nations goes far to explain, not merely their successes, but also the character of their empires.

The fundamental features of the imperial organization must have been due to Cyrus himself. Darius followed in his steps and completed the vast structure. His rôle, indeed, was peculiarly that of supplementing and perfecting the work of his great predecessor. The organization of the empire is planned throughout on broad, free lines; there is nothing mean and timorous in it. The great god Ahuramazda, whom king and people alike acknowledge, has given them dominion over this earth afar, over many peoples and tongues; and the consciousness is strong in them that they are masters of the world. Thus their sovereign style himself "the king of kings" and "the king of the lands"—that is to say, of the whole civilized world. For the provinces remaining unsubdued on the extreme frontiers to the west, the north and the east are in their view almost negligible quantities. And far removed as the Persians are from disavowing their proud sense of nationality ("a Persian, the son of a Persian, an Aryan of Aryan stock" says Darius of himself in the inscription on his tomb)—yet equally vivid is the feeling that they rule the whole civilized world, that their task is to reduce it to unity, and that by the will of Ahuramazda they are pledged to govern it aright.

This is most clearly seen in the treatment of the subject races. In contrast with the Assyrians and the Romans the Persians invariably conducted their wars with great humanity. The vanquished kings were honourably dealt with, the enemy's towns were spared, except when grave offences and insurrections, as at Miletus and Athens, rendered punishment imperative; and their inhabitants were treated with mildness. Like Cyrus, all his successors welcomed members of the conquered nationalities to their service, employed them as administrators or generals and made them grants of land; and this not only in the case of Medes, but also of Armenians, Lyceans, Jews and Greeks. The whole population of the empire was alike bound to military service. The subject-contingents stood side by side with the native Persian troops; and the garrisons—in Egypt, for instance—were composed of the most varied nationalities.

Among the subject races the Medes particularly stood high in favour. Darius in his inscriptions always names them immediately after the Persians. They were the predecessors of the Persians in the empire and the more civilized people. Their institutions, court ceremonial and dress were all adopted by the Achaemenids. Thus the tribal distinctions began to recede, and the ground was prepared for that amalgamation of the Iranians into a single, uniform nation, which under the Sassanids was completely perfected—at least for west of Iran.

The lion's share, indeed, falls to the dominant race itself. The inhabitants of Persis proper—from which the eastern tribes of Carmanians, Utians, &c., were excluded and forced into a separate satrapy—pay no taxes. Instead, they bring the best of their possessions (e.g. a particularly fine fruit) as a gift to their king on festival days; peasants meeting him on his excursions do the same (Plut. Artax. 4, 5; Dinon ap. Aelian. var. hist. i. 31; Xen. Cyr. viii. 5, 21, 7, 1). In recompense for this, he distributes on his return rich presents to every Persian man and woman—the women of Pasargadae, who are members of Cyrus's tribe, each receiving a piece of gold (Nic. Dam. fr. 66, Plut. Alex. 69). In relation to his Persians, he is always the people's king. At his accession he is consecrated in the temple of a warrior-goddess (Anaitis?) at Pasargadae, and partakes of the simple meal of the old peasant-days—a mess offigs, terebins and sour milk (Plut. Artax. 3). The Persians swear allegiance to him and pray to Ahuramazda for his life and the welfare of the people, while he vows to protect them against every attack, and to judge and govern them as did his fathers before him (Herod. i. 132; Xen. Cyr. xviii. 5, 25, 27). For helps he has only the "law-books" (data) which are held in Babylonian documents; cf. Herod. iii. 17, 19, 25, vii. 104; Esther i. 13, &c.)—These—the Persian judges—are nominated by the king for life, and generally bequeath their office to their sons. The royal decision is based on consultation with the great ones of his people: and such is the case with his officials and governors everywhere (cf. the Book of Ezra).

Every Persian able to bear arms is bound to serve the king—the great landowners on horseback, the commonalty on foot. The noble and well-to-do, who need not till their fields in person, are pledged to appear at court as frequently as possible. Their children are brought up in company with the princes "at the gates of the king," instructed in the handling of arms, in riding and hunting, and introduced to the service of the state and the knowledge of the law, as well as the commandments of religion. Then such as prove their worth are called to high office and rewarded, generally with grants of land.
The highest rank was held by the descendants of the six great families, whose heads stood by Darius at the killing of the Magian. The Greeks class them and the king together, under the name of “the seven Persians.” These enjoyed the right of entering the presence unannounced, and possessed princely estates in the provinces. Besides these, however, numbers of other Persians were despatched to the provinces, settled there, and endowed with lands. There existed, in fact, under the Achaemenids a strong colonizing movement, diffused through the whole empire; traces of this policy occur more especially in Armenia, Cappadocia and Lycia, but also in the rest of Asia Minor, and not rarely in Syria and Egypt. These colonists formed the nucleus of the provincial military levy, and were a tower of strength to the Persian dominion. They composed, moreover, the Persian council, and vice-regal household of the Satraps, exactly as the Persians of the home-country composed that of the king.

Though the world-empire of Persia was thus deeply impressed by a national character, care was nevertheless exercised that the general duties and interests of the subject races should receive due consideration. We find their representatives, side by side with the Persians, occupying every sort of position in the regal and vice-regal courts. They take their part in the councils of the satraps, precisely as they do in military service (cf. the evidence of Ezra); and they, too, are rewarded by bounties and estates. To wield a peaceful authority over all the subjects of the empire, to reward merit, and to punish transgression—such is the highest task of king and officials.

On his native soil Cyrus built himself a town, with a palace and a tomb, in the district of Pasargadae (now the ruins of Murghab). This Darius replaced by a new capital, deeper in the centre of the country, which bore the name “Persian” (Parisa), the Persepolis (q.v.) of the later period. But the district of Persis was too remote to be the administrative centre of a world-empire. The natural centre lay, rather, in the ancient fertile tract on the lower Tigris and Euphrates. The actual capital of the empire was therefore Susa, where Darius I. and Artaxerxes II. erected their magnificent palaces. The winter months the kings chiefly spent in Babylon: the hot summer, in the cooler situation of Ecbatana, where Darius and Xerxes built a residence on Mt Elvend, south of the city. From a palace of Artaxerxes II. in Ecbatana itself, the fragments of a few inscribed columns (now in the possession of Mr Lindo Myers and published by Euyett in the Zeit. für Assy. V. have been preserved. To Persis and Persepolis the kings paid only occasional visits especially at their coronations.

Within the empire, the two great civilized states incorporated by Cyrus and Cambyse, Babylon and Egypt, occupied a position of their own. After his defeat of Nabonidus, Cyrus assumed the title of “King of Babyl.”; and the same title was born by Cambyse, Smardis and Darius. So, in Egypt, Cambyse adopted in full the titles of the Pharaohs. In this we may trace a desire to conciliate the native population, with the object of maintaining the fiction that the old state still continued. Darius went still farther. He encouraged the efforts of the Egyptian priesthood in every way, built temples, and enacted new laws in continuance of the old order. In Babylon his procedure was presumably similar, though here we possess no local evidence. But he lived to see that his policy had missed its goal. In 486 B.C. Egypt revolted and was only reduced by Xerxes in 484. It was this, probably, that induced him in 479 to renounce his title of “king of Babyl.,” and to remove from its temple the golden statue of Bel-Marduk (Mardoch), whose hands the king was bound to clasp on the first day of each year. This proceeding led to two insurrections in Babylonia (probably in 484 and 479 B.C.), which were speedily repressed. After that the “kingship of Babyl.” was definitely abolished. In Egypt the Persian kings still retained the style of the Pharaohs; but we hear no more of concessions to the priesthood or to the old institutions, and, apart from the great oasis of el-Kharga, no more temples were erected (see Egypt: History).

At the head of the court and the imperial administration stands the commandant of the body-guard—the ten thousand “Immortals,” often depicted in the sculptures of Persepolis with lances surmounted by golden apples. This grandee, whom the Greeks termed “Chiliarch,” corresponds to the modern vizier. In addition to him, we find seven counsellors (Ezra vii. 14; cf. Esther i. 14). Among the other officials, the “Eye of the King” is frequently mentioned. To him was entrusted the control of the whole empire and the superintendence of all officials.

The orders of the court were issued in a very simple form of the cuneiform script, probably invented by the Medes. This comprised 35 signs, almost all of which denote single sounds. In addition to the inscriptions in cuneiform script (Elamitic) and Babylonian was always appended to the Persian text. In Egypt one in hieroglyphics was added, as in the inscriptions of the Suez canal; in the Greek provinces, another in Greek (e.g. the inscription of Darius on the Bosphorus, Herod. iv. 37, cf. iv. 91). The cuneiform script could only be written on stone or clay. Thus there has been discovered in Babylon a copy of the Behistun (q.v.) inscription preserved on a block of dolerite (Weissbach, Babylomische Mitteil. p. 24).

For administrative purposes, however, it would seem that this inconvenient material was not employed; its place being taken by skins (kēpēm, parchment), the use of which was adopted on a larger scale. These were preserved on rolls, which were further employed as the journals of the satraps or other provincial officials. The written journals and records kept at the court (cf. Diod. ii. 22, 32; Ezra iv. 15, v. 17, vi. 2; Esther vi. 1, ii. 23). With such materials the cuneiform script could not be used; instead, the official language was Aramaic; the method of writing which later led to the so-called Pahlavi, i.e. Parthian script. This mode of writing was obviously alone employed in the state-services since Darius I.; and so may be explained the fact that, under the Persians, the Arabs, the Greeks, and other races, the Persian was the language of the law courts, and, in the inscriptions of Artaxerxes III., only appears in an extremely neglected guise (see CUNEIFORM INScriptions, ALPHABET).

Side by side with the Persian, the Aramaic, which had long been written in the western part of the empire as a provincial language in the whole western half of the empire as a second dominant language. Thus all deeds, enactments and records designed for these provinces were furnished with an official Aramaic version (Ezra iv. 7). Numerous documents in this tongue, dating from the Persian period, have been discovered in Egypt (cf. Sayce and Cowley, Aramaic Papryri discovered at Assuan 1906), and the coins minted by the satraps and generals usually bear an Aramaic inscription. (See also, a lion-weight from Abidos, in the University Museum.) The Demotic in Egypt was employed in private documents alone. Only in the Hellenic provinces of the empire Greek replaced Aramaic (cf. the letter to Pausanias in Thuc. ii. 120; an edict to the satraps of Egypt in M. Dittenberger, Sylloge Inscriptionum Aegypt. xii. 530, Dittenberger, Syllog 2, 80, also, on coins)—a clear proof that the Persians had already begun to recognize the independence and important position of Greek civilization.

Darius I. divided the Persian Empire into twenty great provinces, satrapies, with a “guardian of the country” (khshathra-patav; see SATRAP) at the head of each. A list is preserved in Herodotus (iii. 80 sqq.); but the boundaries were frequently changed. Each satrapy was again subdivided into several minor governorships. The satrap is the head of the whole administration of his province. He is in many places, control of the legal procedure, is responsible for the security of roads and boundaries, and for the conduct of war in the subordinates. The heads of the great military centres of the empire and the commandants of the royal fortresses are outside his jurisdiction: yet the satrapas are entitled to a body of troops of their own, a privilege which they used to the full, especially in later periods. The satrap is held in his position as a subject by the controlling machinery of the empire, especially the “Eye of the King”; by the council of Persians in his province with

1 For the editions of the Persian inscriptions see BEHISTUN. For the Persian documents, Ed. Meyer Entstehung des Judentums, p. 19 sqq. The hieroglyphic inscriptions of the Suez Canal are published in M. Dittenberger, Sylloge Inscriptionum Aegypt. vii. 19, x. xii.; the private documents from Babylonia and Nippur, by Strassmaier, Babyl. Urkunden, and Hilprecht and Clay, Babylon. Expos. d'Univ. of Pennsylvania, vols. ii. x. Numerous Jewish documents of the second period are furnished in B. Weitzmann, Aramaic Inscriptions of the Persian Empire in Babylonia (1921) and Cowley, Aramaic Papryri discovered at Assuan, 1906), among them an official complaint of the Jewish colony settled at Elephantine, addressed to the Persian satrap of Judaean, in 484 B.C., which throws a new light on many passages in Ezra and Nehemiah, published by Schacht in Abhandlungen der berl. Akademie, 1907.)
whom he is bound to debate all matters of importance; and by
the army: while in the hands of the messengers (Pers. ādrudm or āgara—a Babylonian word: see ANGARIA) the government
depatches travel “swifter than the crane,” along the great
imperial highways, which are all provided with regular postal
stations (cf. the description of the route from Susa to Sardis in
Herod. v. 52).

Within the satrapies the subject races and communities occupied a tolerably independent position; for instance, the
Jews, under their elders and priests, who were even
able to convene a popular assembly in Jerusalem
(cf. the Books of Ezra and Nehemiah). Obviously, also,
they enjoyed, as a rule, the privilege of deciding law-suits
among themselves; their general situation being similar to
that of the Christian nationalities under the Ottomans, or to that
of many tribes in the Russian Empire at the present day. The
pressure of despotism was manifest, not so much in that
the king and his officials consistently interfered in individual cases,
but that they did so on isolated and arbitrary occasions,
and then swept aside the privileges of the subject, who was impotant
to resist.

For the rest, the subject population falls into a number of
distinct groups. In the desert (as among the Arabian and
Turanian nomads, in which the rise of large empires was
prevented by the isolated mountains (as in Zagros, in Upper Media, and Mysia, Pisidia, Paphlagonia and
Bithynia in Asia Minor), and also in many Iranian tribes, the
old tribal constitution, with the chieftain as its head, was left
intact even under the imperial suzerainty. The great majority
of the civilized provinces were subdivided into local administra-
tive districts governed by officials of the king and his satraps.
These the Greeks named βοινοί, “peoples.” Within these,
again, there might lie large town settlements whose internal
affairs were controlled by the elders or the officials of the
community: as, for instance, Babylon, Jerusalem, the Egyptian
cities, Tarsus, Sardis and others. On the same footing were
the spiritual principalities, with their great temple-property;
as Bambyce in Syria, the two Comans in Cappodocia, and so
forth. Besides these, however, vast districts were either converted
into royal domains (παράδεισοι) with great parks and hunting
grounds under royal supervision, or else bestowed by
the king on Persians or deserving members of the subject-races
(‘benefactors”) as their personal property. Many of these
estates formed respectable principalities: e.g. of those in
the house of Hydaspes in Armenia, Pharnabazus in Phrygia, Demaratus in Teuthania, Themis-
tocles in Magnesia and Lampascus. They were absolute private
property, handed down from father to son for centuries, and
in the Hellenistic period not rarely became independent king-
doms. These potestates were styled by the Greeks βυκταρες
or μυαραχα.

The City
States.

The last class, quite distinct from all these organizations,
was formed by the city-states (στόχες) with an independent
constitution—whether a monarchy (as in Phoenicia),
an aristocracy (as in Lycia), or a republic with council
and popular assembly (as in the Greek towns).

The essential point was that they enjoyed a separate legalized
organization (autonomy). This was only to be seen in the
extreme western provinces of the empire among the Phoeni-
cians, Greeks and Lycians, whose cities were essentially distinct
from those of the east; which, indeed, to Greek eyes, were only
great villages (κωμοπόλεις). It is readily intelligible that their character should have proved as different as possible
from that of the Persians, whom they came into perpetual collision.

These spots, as a rule, cope with the difficulty by transferring
the government to individual persons who enjoyed their con-
venience: the “tyrants” of the Greek towns. Mardonious, alone,
after his suppression of the Ionic revolt—which had originated
with these very tyrants—made an attempt to govern them by
the assistance of the democracy (492 B.C.).

The provinces of the Persian Empire differed materially in economy as in organization. In the extreme west, a money currency
in its most highly developed form—that of coinage minted by

| PERSIA |

209

the state, or an autonomous community—had developed since the
7th century among the Lydians and Greeks. In the
Commerce
main portion, however, of the Oriental world—Egypt, and Finace.
Syria, Phoenicia and Babylonia—the old mode
of commerce was still in vogue, conducted by means of gold
and silver bars, weighed at each transaction. Indeed, a money
currency only began to make headway in these districts in the
4th century B.C. In the eastern provinces, on the other hand, the
primitive method of exchange by barter was held the field. Only
in the principality and civilized frontier districts of India (the
Punjab) did a system of coinage find early acceptance. These
Persian and Attic money was widely distributed, and imitations
of it struck, in the fifth and fourth pre-Christian centuries.

The empire was divided into a number of petty, often rival, and
dependent administrations. In these, in which the local were varied
conditions and to reconcile them as best it might. At the court,
“natural economy” was still the rule. The officials and Oriental
troops received payment in kind. They were paid “by the table
where they ate,” as from Homer onwards. The indifferency
(cf. Heracleides of Cyme in Athen. iv. 145 B, &c.) and were rewarded
by gifts and assignments of land. The Greek mercenaries, on
the contrary, had to be paid in currency; nor could the satraps
of the great empires dispense with hard cash. The king, again, needed the
precious metals, nor merely for bounties and rewards, but for important
enterprises in which money payment was imperative. Conse-
quently, the royal revenues and taxes were paid partly in the
precious metals, partly in natural produce—horses and cattle,
rice, wheat, grain, and its products, and the manifold
inventions of the industry (cf. Theopomp. fr. 124, 125, &c.). The satraps, also,
in addition to money payments, levied contributions of “fruits,”
at which the officials ate (Nehem. v. 14).

In those sophisticated but tributary provinces, the tribute were collected in the
great treasure-houses at Susa, Persepolis, Pasargadae and
Ecbatana, where gigantic masses of silver and, more
money and especially, of gold, were stored in bullion or partially
coinage. Athen. iv. 219, 735; Arrian iii. 16, &c.; exactly as is the case to-day in the shah’s
treasure-chamber (Curzon, Persia, ii. 484). It is also observable
that the conjunction of payments in kind and money taxes still
exists. The province of Khorasan, for instance, with some half
million inhabitants, paid in 1835 £154,000 in gold, and in addition
the natural produce to the value of £43,000 (Curzon, op. cit. i. 181,
n. 380). When the king required money he minted as much as
was necessary. A reform in the coinage was effected by Darius,
who struck the Darics (Pers. Zang, i.e. piece of gold; the
word had nothing to do with the name of Darius), a gold piece of 130
grains (value about 23s.); this being equivalent to 20 silver pieces
(“Median shekels,” șypan) of 86-5 grains (value according to the
then rate of silver—131 silver to the gold—about 18. 20). The
coining of gold was the exclusive prerogative of the king; silver
could be coined by the satraps, generals, independent communities
and dynasts.

The extent of the Persian Empire was, in essentials, defined
by the great conquests of Cyrus and Cambyses. Darius was
no more a conquistador than Augustus. Rather,
the task he set himself was to secure and, for this purpose in Asia
Minor and Armenia he subdued the mountain-tribes and
advanced the frontier as far as the Caucasus; Colchis alone
remaining an independent kingdom under the imperial
suzerainty. So, too, he annexed the Indus valley and the
aurantiferous hill-country of Kafiristan and Cashmir (Kăśטר or
Kăśṭrēs, Herod. iii. 93, vii. 67, 86; Step. Byz.), as well as
the Dardae in Dardistan on the Indus (Ctesias, Ind. fr. 12.
70, &c.). From this point he directed several campaigns against
the Argeian Sacae, on the Pamir Plateau and northwards, whom he enumerates in his list of subject races, and
whose mounted archers formed a main division of the
armies despatched against the Greeks. It was obviously
an attempt to take the nomads of the Turanian steppe in the
rear and to reduce them to quiescence, which led to his
unfortunate expedition against the Scythians of the Russian
steppes (c. 512 B.C.; cf. Darius).

Side by side, however, with these wars, we can read, even in the
scanty tradition at our disposal, a consistent effort to further
the great policy of international commerce. In the
eastern half of the empire, Darius established a great water-basin, designed
to facilitate the cultivation of the steppe (Herod. iii. 117). He
had the course of the Indus explored by the Carian captain
Sclaxis (q.v.) of Caryaon, who then navigated the Indian Ocean
back to Suez (Herod. iv. 44) and wrote an account of his voyage
in Greek. The desire to create a direct communication between
the seclusion of Persia and the commerce of the world is evident
in his foundation of several harbours, described by Nearchus, on the Persian coast. But this design is still more patent in his completion of a great canal, already begun by Necho, from the Nile to Suez, along which several monuments of Darius have been preserved. Thus it was possible, as says the remnant of an hieroglyphic inscription there discovered, "for ships to sail direct from the Nile to Persia, over Saba." In the time of Herodotus the canal was in constant use (ii. 138, iv. 39); afterwards, when Egypt regained her independence, it decayed, till restored by the second Ptolemy. Even the circumnavigation of Africa was attempted under Xerxes (Herod. iv. 43).

It has already been mentioned, that, in its efforts to conciliate the Egyptians, Darius placed his chief reliance on the priestly-hood: and the same tendency runs throughout the imperial policy toward the conquered races. Thus Cyrus himself gave the exiled Jews in Babylon permission to return and rebuild Jerusalem. Darius allowed the restoration of the Temple; and Artaxerxes I., by the protection accorded to Ezra and Nehemiah, made the foundation of Judaism possible (see Judges: § 19 seq.). Analogously in an edict, of which a later copy is preserved in an inscription, Darius uncovers a temple of Ahura Mazda, the head of a domain (παταρία) in Magnesia on the Maeander, to observe scrupulously the privileges of the Apollo-sancuary.

With all the Greek oracles—even those in the mother-country—the Persians were on the best of terms. And since these might reasonably expect an enormous extension of their influence from the establishment of a Persian dominion, we find them all zealously medizing during the expedition of Xerxes.

For the development of the Asiatic religions, the Persian Empire was of prime importance. The definite erection of a single, vast, and popular religion, corresponding to the original institutions of the state, and compelling them in future to address themselves, not to the community at large, but to individuals, to promise, not political success nor the independence of the people, but the welfare of the monarch, was the first great result of the Persian civilization. The Persian religion was a combination, both practical and capable of extension by propaganda; and, with this, of entering into keen competition one with the other. These two are in the Persians—most clearly manifested in Judaism; but, after the Achaemenid period, they are common to all Oriental creeds, though our information as to the most is scanty in the extreme.

In this competition of religions that of Iran played a most splendid part. The Persian kings—none so much as Darius, whose religious convictions are enshrined in his inscription—and, with the kings, their people, were ardent professors of the pure doctrine of Zoroaster; and the Persians settled in the provinces diffused his creed throughout the whole empire. Thus a strong Persian sect flourished in every satrapy; and, about the time when the religion took deep root among the people, but also in Lydia and Lycia. In the process, however, important modifications were introduced. In contrast with Judaism, Zoroastrianism did not enter the lists against all gods in common, but for other differences, in the sense as subordinate powers—helpers and servants of Ahuramazda. Consequently, the foreign creeds often reacted upon the Persian. In Cappadocia, Aramaic inscriptions have been discovered (1900), in which the indigenous god, the one god of the Sarmatians, still holds his throne, and the Persian creed and its dispersions are to be understood by the monikers of various fluids and its sacred laws. Of the Magnesians, Magnesia on the Maeander, the Jew who was an effective personification of the sun god Mithras, who was present as a young and victorious hero. Both deities occupy the very first rank in the popular creed; while to the theologians they are the most potent of the good powers—Mithras being the herald of the gods, and the god of nature; the other is the god of light and the mediator between man and Ahuramazda, who now fades more into the background. Thus, in the subsequent period, the Persian religion appears purely as the religion of Mithras. The festival of Mithras is the chief festival of the empire, at which the king drinks and is drunk, and dances the national dance (Ctes. fr. 55; Duris fr. 13). This development culminated under Artaxerxes II., who, after the death of his father, in their Inscript. nos, in Art. I. 651, first erected statues to Anaitis in Persepolis, Ecbatana, Bactria, Susa, Babylon, Damascus and Sardis. The truth of this account is proved by the fact that Artaxerxes II. and Artaxerxes III. are the first to mention Zoroaster in their inscriptions, and Zoroaster and Mithra side by side with Ahuramazda. Other gods, who come into prominence, are the dragon-slayer Verethragna (Artagnes) and the Good Thought (Vohumano, Omanos); and even the Sacaean Adarbasht, or Mithras, was adopted from Babylon (Beros. fr. 3; Ctes. fr. 16; Strabo xi. 153, &c.). The supposed center of the Sakaic empire in the west were the district of Acilisene in Armenia (Strabo xi. 532, &c.), the town of Zela in Cappadocia (Strabo xii. 559), and several cities in Lydia.

The position of the Persian monarchy as a world-emire is characterized in the buildings of Darius and Xerxes in Persepolis and Susa. The peculiarly national basis, still recognizable in Cyrus's architecture at Pasargadae, becomes insignificance. The royal edifices and sculptures are dependent, mainly, on Babylonian models, but, at the same time, we can trace in them the influence of Greece, Egypt and Asia Minor; the last in the rock-sepulchres. All these elements are combined (Cyrop. i. 31, iv. 53 sqq.) and the architectural art of the Oriental architecture has found possible. Nevertheless, the result is a national art, but the art of a world-emire; and it is obvious that foreign craftsmen must have been active in the royal services—see the Ctes. fr. 19 (Pline. xxxiv. 68). So, with the collapse of the empire, the Persian art vanishes also: and when, some 500 years later, a new art arose under the Sassanids, whose achievements stand to those of Achaemenid art in much the same relation as the achievements of the two dynasties to each other, we discover only isolated reminiscences of its predecessor.

For the organization of the Persian Empire, see Barnabas Brisson, De regio Persarum principatibus libri iii. (1590); Flac. Ideen über Politik, Handel und Kultur in Persien, i. 461, &c.; G. Rawlinson, History of Herodotus, ii. 555 sqq.; Five Eastern Monarchies, iii.; Eduard Meyer, Geschichte der Allerthums, iii. On the Satrapies, cf. Krumholz, De Asse minoris satrapis persiciis (1885). See also Mithras.

3. History of the Achaemenid Empire.—The history of the Persian Empire was often written by the Greeks. The most ancient work preserved is that of Herodotus (q.v.), who supplies rich and valuable materials for the period ending in 479 B.C. These materials are drawn partly from sound tradition, partly from original knowledge—as in the account of the satrapies and their distribution, the royal highway, the nations in Xerxes' domains, and the entrances to the palaces; and partly, as is admittedly fabulous: for instance, the stories of Cyrus and Croesus, the conquest of Babylon, &c. Forty years later (c. 390 B.C.), the physician Ctesias of Cnidus, who for 17 years (414-398 B.C.) remained in the service of the Great King, composed a great work on the Persian history, known to us from an extract in Photius and numerous fragments. Ctesias (q.v.) possesses a more precise acquaintance with Persian views and institutions than Herodotus; and, where he deals with matters that came under his own cognizance, he gives much useful information. For the early period, on the other hand, he only proves how rapidly the tradition had degenerated since Herodotus; and here his narrations can only be utilized in isolated cases, and that with the greatest caution. Of more value was the great work of Dino of Colophon (c. 340), which we know from numerous excellent fragments; and on the same level may be placed a few statements from Herodotus of Cyme, which afford specially into an accurate evidence on Persian institutions. To these must be added the testimony of the other Greek historians (Thucydides, Ephorus, Theopompos, &c., with the histories of Alexander), and, before all, that of Xenophon in the Anabasis and Helenika.

The Cyropaedia is a didactic romance, written with a view to Greek institutions and rarely preserving genuine information on the Persian Empire. Of Oriental sources, only the contemporary books of Ezra and Nehemiah are of much importance: also, a few statements in the much later Esther romance. Berosus's history of Babylon contained much valuable and trustworthy information, but next to nothing has survived. That the native tradition almost entirely forgot the Achaemenid Empire, has been mentioned above. For a more detailed account
of these sources see separate articles on Herodotus, &c.; Ezra; and Nehemiah.

The external history of the empire is treated under the individual kings (see also history sections of articles Greece; Egypt; &c.). The order is as follows:

**Kings**

**Cyprus** (558-548); conquered the Medes in 550; king of Babylon from 538.

**Cambyses** (528-521).

**Smerdis** (521).

**Darius I.** (521-485).

**Xerxes I.** (485-465).

(Xerxes II. and Sicydianus or Sogdianus, 425-424.)

**Darius II. Nothus** (424-404).

**Artaxerxes II.** (404-359).

**Artaxerxes III.** (359-338).

**Arses** (338-336).

**Darius III.** (336-330).

The chronology is exactly verified by the Ptolemaic canon, by numerous Babylonian and a few Egyptian documents, and by the evidence of the Greeks. The present article gives only a brief conspectus of the main events in the history of the empire.

Though, unlike Cyprus and Cambyses, Darius made no new expeditions of conquest, yet a great empire, which is not bounded by another equally great, but touches on many small tribes and independent communities, is inevitably driven to expansion. We have already seen that the attempt of Darius to control the predatory nomads in the north led to his expedition against the Scythians; this, again, led to the incorporation of Thrace and Macedonia, whose king Perdiccas submitted. And since a great portion of the Mediterranean coast-line belonged to the empire, further complications resulted automatically. In contrast with the Greeks Carthage took the part of Persia. Darius, indeed, numbers the city—under the name of Karka—among his dominions: as also the Mazynes (Maciya) on the Syrtis (Andreas, *Verhandl. d. xiii. oriental. Congresses*, Hamburg, 1902, p. 97). But, above all, the Greek cities, with their endless feuds and violent internal factions, were incessant in their appeals for intervention. Nevertheless, Darius left European Greece to itself, till the support accorded to the Ionian and Carian insurgents by Athens and Eretria (490 B.C.) made war inevitable. But not only the expeditions of Mardonius (492) and Datis (490), but even the carefully prepared campaign of Xerxes, in conjunction with Carthage, completely failed (480-479). On the fields of Marathon and Plataea, the Persian archers succumbed to the Greek phalanx of hoplites; but the actual decision was effected by Themistocles, who had meanwhile created the Athenian fleet which at Salamis proved its superiority over the Perio-Pheenician armada, and thus precluded beforehand the success of the land-forces.

The wreck of Xerxes' expedition is the turning-point in the history of the Persian Empire. The superiority of the Greeks was so pronounced that the Persians never found courage to repeat the attempt (480). On the contrary, in 466 B.C. their army and fleet were again defeated by Cimon on the Eurymedon, the sequel being that the Greek provinces on the Asiatic coast, with all the Thracian possessions, were lost. In itself, indeed, this loss was of no great significance to such a vast empire; and the attempts of Athens to annex Cyprus and conquer the Nile valley, in alliance with the revolted Egyptians, ended in failure. Athens, in fact, had not sufficient strength to undertake a serious invasion of the empire or an extensive scheme of conquest. Her struggles with the other Hellenic states constrained her, by the peace of Callias (448), definitely to renounce the Persian war; to abandon Cyprus and Egypt to the king; and to content herself with his promise—not that he would surrender the littoral towns, but that he would abstain from an armed attack upon them. The really decisive point was, rather, that the disasters of Salamis and Plataea definitely shattered the offensive power of the empire; that the centre of gravity in the world's history had shifted from Susa and Babylon to the Aegean Sea; and that the Persians were conscious that in spite of all their courage they were henceforward in the presence of an enemy, superior in arms as well as in intellect, whom they could not hope to subdue by their own strength.

Thus the great empire was reduced to immobility and stagnation—a process which was assisted by the deteriorating influences of civilization and world-dominion upon the character of the ruling race. True, the Persians continued to produce brave and honourable men. But the influences of the harem, the eunuchs, and similar court officials, made appalling progress, and men of energy began to find the temptations of power stronger than their patriotism and devotion to the king. Thus the sarrats aspired to independence, not merely owing to unjust treatment, but also to avarice or favourable conditions. As early as 465 B.C., Xerxes was assassinated by his powerful vizier (chiliarch) Artabanus, who attempted to seize the reins of empire in fact, if not in name. A similar instance may be found in Bagoas (q.v.), after the death of Artaxerxes III. (404 B.C.). To the king must be added the degeneration of the royal line—a degeneration inevitable in Oriental states. Kings like Xerxes and more especially Artaxerxes I. and Artaxerxes II., so far from being gloomy despots, were good-natured potentates, but weak, capricious and readily accessible to personal influences. The only really brutal tyrants were Darius II., who was completely dominated by his bloodthirsty wife Parysatis, and Artaxerxes III. who, though he shed rivers of blood and all but exterminated his whole family, was successful in once more uniting the empire, which under the feeble sway of his father had been threatened with dissolution.

The upshot of these conditions was, that the empire never again undertook an important enterprise, but neglected more and more its great civilized mission. In considering, however, the subsequent disasters and wars, it must be borne in mind that they affected only individual portions of the empire, and only on isolated occasions involved more extensive areas in long and serious strife. To most of the provinces the Achamenid dominion was synonymous with two centuries of peace and order. Naturally, however, the wild tribes of the mountains and deserts, who could be curbed only by strict imperial control, asserted their independence and harassed the neighbouring provinces. Among these tribes were the Carduchians in Zagros, the Cossaeans and Uxians in the interior of Elam, the Caspians and other non-Aryan tribes in northern Media, the Pisidians, Issurians and Lycaonians in the Taurus, and the Myssians in Olympus. All efforts to restore order in these districts were fruitless; and when the kings removed their court to Ecbatana, they were actually obliged to purchase a free passage from the mountain tribes (Strabo xi. 524; Arrian iii. 17, i). The kings (e.g. Artaxerxes II.) repeatedly took the field in great force against the Caspians, but unsuccessfully. When, in 400 B.C., Xenophon marched with the mercenaries of Cyrus from the Black Sea to the Black Sea, to the non-existent north of Armenia, and the tribes of the Pontic mountains, with the Greek cities on the coast, were completely independent. In Paphlagonia, the native dynasts founded a powerful though short-lived kingdom, and the chieftains of the Bithynians were absolutely their own masters. The frontier provinces of India were also lost. Egypt, which had already revolted under Libyan princes in the years 486-484, and again with Athenian help in 460-454, finally asserted its independence in 454. Henceforward the native dynasties repelled every attack, till they succumbed once more before Artaxerxes III. and Mentor of Rhodes.

In the other civilized countries, indeed, the old passion for freedom had been completely obliterated; and after the days of Darius I.—apart from the Greek, Lycaen and Phoenician towns—not a single people in all these provinces dreamed of shaking off the foreign dominion. All the more clearly, then, was the inner weakness of the empire revealed by the revolts.
of the satraps. These were facilitated by the custom—quite contrary to the original imperial organization—which entrusted the provincial military commands to the satraps, who began to receive great masses of Greek mercenaries into their service. Under Artaxerxes I. and Darius II., these insurrections were still rare. But when the revolt of the younger Cyrus against his brother (401 B.C.) had demonstrated the surprising ease and rapidity with which a courageous army could penetrate into the heart of the empire—when the whole force of that empire had proved powerless, not only to prevent some 12,000 Greek troops, completely surrounded, cut off from their communications, and deprived through treachery of their leaders, from escaping to the coast, but even to make a serious attack on them—then, indeed, the imperial impotence became manifest. After that, revolts of the satraps in Asia Minor and Syria were of everyday occurrence, and the task of suppressing them was complicated by the foreign wars which the empire had to sustain against Greece and Egypt.

At this very period, however, the foreign policy of the empire gained a brilliant success. The collapse of the Athenian power before Syracuse (413 B.C.) induced Darius II. to order his satraps Tissaphernes and Pharnabazus, in Asia Minor, to collect the tribute overdue from the Greek cities. In alliance with Sparta (see PELOPONNESIAN WAR), Persia intervened in the conflict against Athens, and it was Persian gold that made it possible for Lysander to complete her overthrow (404 B.C.). True, war with Sparta followed immediately, over the division of the spoils, and the campaigns of the Spartan generals in Asia Minor (399-395) were all the more dangerous as they gave occasion to numerous rebellions. But Persia joined the Greek league against Sparta, and in 394 Pharnabazus and Conon annihilated the Lacedaemonian fleet at Cnidus. Thus the Spartan power of offence was crippled; and the upshot of the long-protracted war was that Sparta was thenceforth satisfied with the tributary alliance of the Greek cities, and renounced with the Peace of Antalcidas (485) concluded with the king in 387 B.C., not only renounced all claims to the Asiatic possessions, but officially proclaimed the Persian suzerainty over Greece. Ninety years after Salamis and Plataea, the goal for which Xerxes had striven was actually attained, and the king's will was law in Greece. In the following decades, no Hellenic state ventured to violate the king's peace, and all the feuds that followed centred round the efforts of the combatants—Sparta, Thebes, Athens and Argos—to draw the royal powers to their side (see GREECE: Ancient History).

But, for these successes, the empire had to thank the interminable strife of its Greek opponents, rather than its own strength. Its feebleness, when thrown on its own resources, is evident from the fact that, during the next years, it failed both to reconquer Egypt and to suppress completely King Evagoras of Salamis in Cyprus. The satrap revolts, moreover, assumed more and more formidable proportions, and the Greek states began once more to tamper with them. Thus the reign of Artaxerxes II. ended, in 359 B.C., with a complete dissolution of the imperial authority in the west. His successor, Artaxerxes Ochus, succeeded yet again in restoring the empire in its full extent. In 355 B.C., he spoke the fatal word, which, a second—or rather a third—time, demolished the essentially unsound power of Athens. In 343 he reduced Egypt, and his generals Mentor and Memnon, with his vizier Bagas (q.v.), crushed once and for all the resistance in Asia Minor. At his death in 338, immediately before the final catastrophe, the empire to all appearances was more powerful and more firmly established than it had been since the days of Xerxes.

These successes, however, were won only by means of Greek armies and Greek generals. And simultaneously the Greek civilization—diffused by mercenaries, traders, artists, prostitutes and slaves, advanced in ever greater measure. In Asia Minor and Phoenicia we can clearly trace the progress of Hellenism (q.v.), especially by the coinage. The stamp is cut by Greek hands and the Greek tongue predominates more and more in the inscription. We can see that the victory of Greek civilization had long been prepared on every side. But the vital point is that the absolute superiority of the Hellenes was recognized as incontestable on both hands. The Persian sought to protect himself against danger, by employing Greeks in the national service and turning Greek policy to the interests of the empire. In the Greek world itself the disgrace that a people, called to universal dominion and capable of wielding it, should be dependent on the mandate of an impotent Asiatic monarchy, was keenly felt by all who were not yet absorbed in the rivalry of city with city. The spokesman of this national sentiment was Isocrates; but numerous other writers gave expression to it, notably, the historian Callisthenes of Olynthus. Union between Greeks, voluntary or compulsory, and an offensive war against Persia, was the programme they propounded.

Nor was the time for its fulfilment far distant. The new power which now rose to the first rank, created by Philip of Macedon, had no engrafted tendency slavish to the Persian Empire. Its immediate programme was rather Macedonian expansion, at the expense of Thrace and Illyria, and the subjection of the Balkan Peninsula. But, in its efforts to extend its power over the Greek states, it was bound to make use of the tendencies which aimed at the unification of Greece for the struggle against Persia: and this ideal demand it dared not reject.

Thus the conflict became inevitable. In 340, Artaxerxes III. and his satraps supported the Greek towns in Thrace—Perinthus and Byzantium—against Macedonian aggression; in 338 he concluded an alliance with Demostenes. When Philip, after the victory of Chaeronea, had founded the league of Corinth (337) embracing the whole of Greece, he accepted the national programme, and in 336 despatched his army to Asia Minor. That he never entertained the thought of conquering the whole Persian Empire is certain. Presumably, his ambitions would have been satisfied with the liberation of the Greek cities, and, perhaps, the subjection of Asia Minor as far as the Taurus. With this his dominion would have attained much the same compass as later under Lysimachus; farther than this the boldest hopes of Isocrates never went.

But Philip's assassination in 336 fundamentally altered the situation. In the person of his son, the throne was occupied by a soldier and statesman of genius, saturated with Greek culture and Greek thought, and intolerant of every goal but the highest. To conquer the whole world for Hellenic civilization by the aid of Macedonian spears, and to reduce the whole earth to unity, was the task that this heir of Heracles and Achilles saw before him. This idea of universal conquest was with him a conception much stronger developed than that which had inspired the Achaemenid rulers, and he entered on the project with full consciousness in the strictest sense of the phrase. In fact, if we are to understand Alexander aright, it is fatal to forget that he was overthrown by death, not at the end of his career, but at the beginning, at the age of thirty-three.

VI. The Macedonian Dominion.—How Alexander conquered Persia, and how he framed his world-empire, cannot be related here. The essential fact, however, is that after the victory of Gaugamela (Oct. 1, 331 B.C.) and, still more completely, after the assassination of Darius—avenged according to the Persian laws, on the perpetrators—Alexander regarded himself as the legitimate head of the Persian Empire, and therefore adopted the dress and ceremonial of the Persian kings.

With the capture of the capitals, the Persian war was at an end, and the atonement for the expedition of Xerxes was complete—a truth symbolically expressed in the burning of the palace at Persepolis. Now began the world-conquest. For an universal empire, however, the forces of Macedonia and Greece were insufficient; the monarch of an empire could not be bound by the limitations imposed on the tribal king of Macedonia or the general of a league of Hellenic republics. He must stand as

1 See Alexander the Great; Macedonian Empire; Hellenism (for later results).
HYDARMIDS held its ground; and to these must be added, in the east of Asia Minor, the kingdoms of Pontus and Cappadocia, founded c. 301, by the Persians Mithradates I. and Ariarathes I. These states were fragments of the Achaemenid Empire, which had safely transferred themselves to the Hellenistic system-state.

The annexation of Iran by Seleucus Nicator led to a war for the countries on the Indian frontier; his opponent being Sandracottus or Chandragupta Maurya (q.v.), the founder of the great Indian Empire of Maurya (Paliombohrs).

The result was that Seleucus abandoned to the Indian king, not merely the Indian provinces, but even the frontier districts west of the Indus (Strabo xv. 680–724), receiving as compensation 500 elephants, with other presents (Appian, Syr. 55; Justin xiv. 4; Plut. Alex. 62; Athen. i. 18 D.). His next expedition was to the west to assist Lysimachus, Ptolemy and Cassander in the overthrow of Antigonus.

The battle of Ipsus, in 301, gave him Syria and the east of Asia Minor; and from then he resided at the Syrian town of Antiochias on the Orontes. Shortly afterwards he handed over the provinces east of the Euphrates to his son Antiochus, who, in the following years, till 282, exercised in the East a very energetic and beneficial activity, which continued the work of his father and gave the new empire and its colonies Hellenistic civilization, the latter being in some respects a result of the conquests Alexander had founded several cities in Bactria, Sogdiana and India, in which he settled his veterans. On his death, these revolted and endeavoured to return to Greece, but were attacked and cut to pieces by Pithon (Diod. xviii. 7). Of the other Greek towns in Asia scarcely any were founded by Alexander himself, though the plan adopted by his successors of securing their dominions by building Greek cities may perhaps be due to him (cf. Polyb. x. 27). Most of these new cities were based on older settlements; but the essential point is, that they were peopled by Greek and Macedonian colonists, and enjoyed civic independence with laws, officials, councils and assemblies of their own, in other words, an autonomous communal constitution, under the suzerainty of the empire. A portion, moreover, of the surrounding land was assigned to them. Thus a great number of the country-districts—the οἰκείων above mentioned—were transformed into municipal corporations, and thereby withdrawn from the immediate government of the king and his officials (satraps or strategoi), their own subject, in which the Hellenistic cities, where they received unconditional freedom and so ranked as "confederates." The native population of these villages and rural districts, at first, had no civic rights, but were governed by the foreign settlers. Soon, however, the two elements began to coalesce; in the Seleucid Empire, the process seems generally to have been both rapid and complete. Thus the cities became the main factors in the diffusion of Hellenism, the Greek language and the Greek civilization over all Asia as far as the Indus. At the same time they were the centres of commerce and industrial life: and this, in conjunction with the royal favour, and the privileges accorded them, continually drew new settlers (especially Jews), and many of them developed into great and flourishing towns (see further under HELLENISM).

Shortly after his conquest of Babylonia, Seleucus had founded a new capital, Seleucia (q.v.), on the Tigris: his intention being at once to displace the ancient Babylon from its former central position, and to replace it by a Greek city. This was followed by a series of other foundations in Mesopotamia, Babylonia and the Institutions of the Seleucid Empire (cf. Polyb. x. 27). These was the first time that a sequence of Greek towns, designated as a barrier against the barbarians. Among those mentioned are: Rhagae (Ray), which Seleucus metamorphosed into a Hellenic city, Europus, Laodicea, Apamea and Heraclea (Strabo xi. 525: Plin. vi. 43: cf. MEDIA). To these must be added Achaea in Parthia, and, farther to the east, Alexandria Arion in Aria, the modern Herat: also Antiochia Margiana (Strabo xi. 514, 516 Plin. 46, 93), now Merv, and many others. Further, Alexandrias in Aradosia, near Kandahar, and the towns founded by Alexander on the Hindu-Kush and in Sogdia.
Thus an active Hellenic life soon arose in the East; and Greek settlers must have come in numbers and founded new cities, which afterwards formed the basis of the Graeco-Bactrian kingdom. Antiochus's general Demodamas crossed the Jaxartes and set up an altar to the Didymaean Apollo (Plin. vi. 49). Another general, Patrocles, took up the investigation of the Caspian, already begun by Alexander. In contrast with the better knowledge of an older period, he came to the conclusion that the Caspian was connected with the ocean, and that it was possible to reach India on shipboard by that route (Strabo ii. 74, xi. 518; Plin. vi. 38). A project of Seleucus to connect the Caspian with the Sea of Azov by means of a canal is mentioned by Pliny (vi. 31). To Patrocles is due the information that an active commerce in Indian wares was carried on with the shores of the Black Sea, via the Caspian (Strabo xi. 509).

While Hellenism was thus gaining a firm footing in all the East, the native population remained absolutely passive. Apart from the ruder mountain tribes, no national resistance was dreamed of for centuries. The Iranians quietly accepted the foreign yoke, and the higher classes adopted the external forms of the alien civilization (cf. the dedication of a Bactrian, Hyspasaes, son of Mithroazes, in the inventory of the temple of Apollo in Delos, Dittenberger, Sylloge, 558, l. 109) even though they were unable to renounce their innate characteristics. Eratosthenes, for instance, speaks (ap. Strabo i. 66) in high terms of the Iranians (Arioi), ranking them (as well as the Indians, Romans and Carthaginians) on a level with the Greeks, as regards their capacity for adopting city civilization. The later Parsee tradition contends that Alexander burned the sacred books of Zoroaster, the Avesta, and that only a few fragments were saved and afterwards reconstructed by the Arsacids and Sassanids. This is absolutely unhistorical. The Persian religion was never attacked by the Macedonians and Greeks. Under their dominion, on the contrary, it expanded with great vigour, not only in the west (Armenia, north Syria and Asia Minor), where it was the official religion of the kings of Pontus and Cappadocia), but also in the east, in the countries on the Indian frontier. That the popular gods—Mithras, Anaitis, &c.—had come to the forefront has already been mentioned. This propagandism, however, was void of all national character, and ran on precisely the same lines as the propagandism of the Syrian, Jewish and Egyptian cults. Only in Persia itself, so far as we can judge from a few scanty traces, the national character of the religion seems to have survived among the people side by side with the memory of their old imperial position.

In 282 B.C. Seleucus took the field against Lysimachus, and annexed his dominions in Asia Minor and Thrace. In 281 he was assassinated in crossing to Europe, and his son Antiochus I. was left supreme over the whole empire. From that time onward the Seleucid Empire was never at rest. Its gigantic extent, from the Aegean to the Indus, everywhere offered points of attack to the enemy. The fact that this area was held by a compact and effective empire, employed every means to weaken their Asiatic rivals; and auxiliaries were found in the minor states on the frontier—Atropatene, Armenia, Cappadocia, Pontus and Bithynia, the Galatians, Pergamum, Rhodes and other Greek states. Moreover, the promotion of Greek civilization and city life had created numerous local centres, with separate interests and centrifugal tendencies, struggling to attain complete independence, and perpetually forcing new concessions from the empire. Thus the Seleucid kings, courageous as many of them were, were always battling for existence (see Seleucid Dynasty).

These disturbances severely affected the borders of Iran. While the Seleucid Empire, under Antiochus II. theos (264–247), was being harried by Ptolemy II. Philadelphia, and the king's attention was wholly engaged in the defence of the western provinces, the Greeks revolted in Bactria, under their governor Diodotus (q.v.). Obviously, it was principally the need of protection against the nomadic tribes which led to the foundation of an independent kingdom; and Diodotus soon attained considerable power over the provinces north of the Hindu-Kush. In other provinces, too, insurrection broke out (Strabo xi. 575, Justin xii. 4); and Arsaces, a chief of the Parthi or Aparni—an Iranian nomad tribe (therefore often called Dahan Scythians), inhabiting the steppe east of the Caspian—made himself master of the district of Parthia (g.v.) in 248 B.C. He and his brother Tiridates (q.v.) were the founders of the Parthian kingdom, which, however, was confined within very modest limits during the following decades. Seleucus II. Callinicus (247–226) successfully encountered Arsaces (or Tiridates), and even expelled him (c. 238); but new risings recalled Seleucus to Syria, and Arsaces was enabled to return to Parthia.

Greater success attended Antiochus III., the Great (222–187). At the beginning of his reign (220) he subdued, with the help of his minister Hermias, an insurrection of the satrap Molon of Media, who had assumed the royal title and was supported by his brother Alexander, satrap of Persis (Polyb. v. 40 sqq.). He further seized the opportunity of extorting an advantageous peace from King Ariabazanes of Atropatene, who had considerably extended his power (Polyb. v. 53). After waging an unsuccessful war with Ptolemy IV. for the conquest of Coele-Syria, but suppressing the revolt of Achaesus in Asia Minor, and recovering the former provinces of the empire in that quarter, Antiochus led a great expedition into the East, designing to restore the imperial authority in its full extent. He first removed (211) the Armenian king Xerxes by treachery (Polyb. viii. 25; John of Antioch, fr. 53), and appointed two governors, Artaxias and Zariadis, in his place (Strabo xi. 531). During the next year he reduced the affairs of Media to order (Polyb. x. 27); he then conducted a successful campaign against Arsaces of Parthia (209), and against Euthydemos (q.v.) of Bactria (208–206), who had overthrown the dynasty of Diodotus (Polyb. x. 28 sqq., 48 sqq., xi. 34; Justin xii. 3). In spite of his successes he concluded peace with both kingdoms, rightly considering that it would be impossible to retain these remote frontier provinces permanently. He next renewed his old friendship with the Indian king Sophaganes (Subhagases), and received from him 150 elephants (206 B.C.). Through Arachosia and Drangiane, in the valley of the Eymander (Helmand), he marched to Carmania and Persis (Polyb. xi. 34). Both here and in Babylonia he re-established the imperial authority, and in 205 undertook a voyage from the mouth of the Tigris, through the Arabian gulf to the flourishing mercantile town of Gerrha in Arabia (now Bahrein) (Polyb. xiii. 9).

Shortly afterwards, however, his successful campaign against Ptolemy V. Epiphanes led to a war with Rome in which the power of the Seleucid Empire was shattered (190 B.C.). Decay of the Asia Minor lost, and the king compelled to pay a heavy contribution to Rome for a long term of years. In order to raise money he plundered a wealthy temple of Bel in Elam, but was killed by the inhabitants, 187 B.C. (Diod. xxvii. 3, xxx. 15; Strabo xvi. 744; Justin xxii. 2; S. Jerome (Hieronymus) on Dan. x. 10; Euseb. Chron. i. 252). The consequence of this enfeeblement of the empire was that the governors of Armenia asserted their independence. Artaxias founded the kingdom of Great Armenia; Zariadis, that of Sophene on the Euphrates and the sources of the Tigris (Strabo xi. 531). In other districts, also, rebellions occurred; and in the east, Euthydemos and his successors (Demetrios, Eucratidas, &c.) began the conquest of the Indus region and the Iranian borderland (Arachosia, Aria). (See BACTRIA; EUTHYDEUMOS; EUKRATIDAS; DEMETRIUS; MENANDER.)

But the energetic Seleucids fought desperately against their fate. Antiochus IV. Epiphanes (176–163) restored once more the Eastern dominion, defeated Artaxias of Armenia (Appian, Syr. 45; Diod. xxxi. 178; S. Jerome on Dan. x. 40), restored several towns in Babylonia and subdued the Elymaeans. His attempt, however, to plunder the sanctuary of Anaitis failed (Polyb. xxxi. 111; cf. Maccab. i. 6, ii. 13; App. Syr. 66). Persis, also, and
Media were still subject to him. But after his death at Tabae in Persia (163 B.C.; cf. Polyb. xxxi. 11; Maccab. i. 6, ii. 9; Jos. Ant. Jud. xii. 9, 1), the Romans took advantage of the dynastic broils to destroy the Seleucid Empire. They reduced its army and fleet, and favoured every rebellion: among others, that of the Jews. In spite of all, Demetrius I. Soter (161–150) succeeded in suppressing (159) a revolt of Timarchus of Miletus, governor of Babylon, who had occupied Media, assumed the title of "great king," and had been recognized by the Romans (Appian, Syr. 45–47; Trogus, Proli. 34; Diod. xxxii. 27 A: cf. the coins of Timarchus).1

VII. The Parthian Empire of the Arsacids.—Meanwhile, in the east, the Arsacids had begun their expansion. Phraates I. (c. 175–170) subdued the Mardians in Elburz. His brother Mithradates I. (c. 170–138) had to sustain a difficult war with Eucratides of Bactria, but eventually succeeded in wresting from him a few districts on the Turanian frontier. Indeed, he penetrated as far as, and farther than, the

Phraates II. Indus (Diod. xxxiii. 18; Oros. v. 1, 16). In the west he conquered Media, and thence subdued Babylonia. He further reduced the Elymaeans, sacked their temple in the mountains, and captured the Greek city of Seleucia on the Hedphyon (Strabo xvi. 744; Justin xii. 6). The Seleucids, meanwhile, were harassed by aggrivated disorders and insurrections. Nevertheless, in 140, Demetrius II. Nicator took the field in order to save the east, but was defeated and captured. Shortly afterwards Mithradates I. died. His son Phraates II. (c. 138–127) was attacked in 130 by Antiochus VII. Sidetes, the brother of Demetrius II., on which the Parthian king released the latter. Antiochus pressed successfully on, and once more recovered Babylonia, but in 129 was defeated in Media and fell in a desperate struggle. With this battle the Seleucid dominion over the countries east of the Euphrates was definitely lost. The Babylonian towns, especially Seleucia (q.v.), were handed over by Phraates to his favourite, the Hyrcanian Himerus, who punished them severely for their resistance.

During these wars great changes had taken place in eastern Iran. In 159 Mongolians tribes, whom the Chinese call Yue-chi and the Greeks Scythians, forced their way into Sogdiana, and, in 139, conquered Bactria (Strabo xi. 571; Justin xlii. 1; Trog. Proli. 41: see BACTRIA). From Bactria they tried to advance farther into Iran and India. Entering into an alliance with Antiochus VII., they assailed the Parthian Empire, Phraates II. marched to encounter him, but was himself defeated and slain, and his country ravaged far and wide. His successor Artabanus I. (c. 127–124), the uncle of Phraates, also fell in battle against the Tocharians, the principal Scythian tribe of Turan (Dio Cass. xxxvi. 1, 2; Jos. Ant. ftr. 66); but his son Mithra
dates II., surnamed "The Great" (c. 124–88), defeated the Scythians and restored for a while the power of the Arsacids. He also defeated Artabasdes, the king of Great Armenia; his son Tigranes, a hostage in the hands of the Parthians, was only redeemed by the cession of 70 valleys (Strabo xi. 532). When Tigranes attempted to seize Cappadocia, and the Roman praetor P. Cornelius Sulla advanced against him, Mithradates in 92 B.C. concluded the first treaty between Parthia and Rome (Plut. Sulla, v.; Liv. Epit. 70). The dynastic troubles in the Seleucids in Syria gave him an opportunity for successful intervention (Jos. Ant. Jud. xiii. 13, 41, 14, 3). Shortly afterwards he died; and, with his death, the Arsacid power collapsed for the second time. The possession of the western provinces and the dominant position in western Asia passed to the Armenian Tigranes (q.v.), who wrested from the Parthians Mesopotamia and the suzerainty of the land of Ani, Armenia, and Elymaeans. Simultaneously, the Arsacids began a new and severe conflict with the Scythians. Parthian coins, probably dating from this period (Wroth, Catil. of the Coins of Parthia, 1903, p. xxx. and p. 40), mention victorious campaigns of Parthian kings and a conquest of the provinces of Aria, Margiane and (? Truxiane (cf. Strabo xi. 205). But how

PERSIA

215

But the situation was shown by the fact that in 76 B.C. the octogenarian king Sanatruces was seated on the Parthian throne by the Scythian tribe of the Sacaracians (cf. Strabo xi. 511; Trog. Proli. 42). The names of his predecessors are not known to us. Obviously this period was marked by continual dynastic feuds (cf. Trog. Proli. 42: "ut varia complurium regum in Parthia successionem imperium accipit Orodes qui Crassum delevit"). Not till Sanatruces' successor Phraates III. (70–57) do we find the kingdom again in a settled state. A fact of decisive significance was that the Romans now began to advance against Tigranes. In vain Mithradates of Pontus and Tigranes turned to the Parthian king, the latter even proffering restitution of the conquered frontier provinces. Phraates, though rightly distrusting Rome, nevertheless concluded a treaty with Lucullus (69 B.C.) and with Pompey, and even supported the latter in his campaign against Tigranes in 66. But after the victory it was manifest that the Roman general could not long remain himself in the west by the Parthian treaty. When Tigranes had submitted, Pompey received him into favour and extended the Roman supremacy over the vassal states of Gordyene and Osroene; though he had allured the Parthian king with the prospect of the recovery of his old possessions as far as the Euphrates. Phraates complained, and simultaneously attacked Tigranes, now a Roman vassal (65 B.C.). But when Pompey refused repARATION Phraates recognized that he was too weak to begin the struggle with Rome, and contented himself with forming an alliance with Tigranes, in hopes that the future would bring an opportunity for his revenge (Dio Cass. xxxvi. 5, 51, xxxvii. 5 sqq.; Plut. Luc. 30; Pomp. 33, 38; cf. Sallust's letter of Mithradates to Arsaces).

Although Phraates III. had not succeeded in regaining the full power of his predecessors, he felt justified in again assuming the title "king of kings"—which Pompey declined to acknowledge—and even in proclaiming himself as "god" (Philostr. ftr. 12 ap. Phot. cod. 97; and on part of his coins), but in 57 B.C. the "god" was assassinated by his sons Orodies and Mithradates.

The Parthian Empire, as founded by the conquests of Mithra
dates I. and restored, once by Mithradates II. and again by Phraates III., was, to all exterior appearance, a con
tinuation of the Achaemenid dominion. Thus the Arsacids now began to assume the old title "king of kings" (the shakhanshah of modern Persia), though previously their coins, as a rule, had borne only the legend "great king." The official version, preserved by Arrian in his Parthica (ap. Phot. cod. 58: see PARTHIA), derives the line of these chieftains of the Parnian nomads from Artaxerxes II. In reality, however, the Parthian Empire was totally different from its predecessor, both externally and internally. It was anything rather than a world-empire. The countries west of the Euphrates never owned its dominion, and even of Iran itself not one half was subject to the Arsacids. There were indeed vassal states on every hand, but the actual possessions of the kings—the provinces governed by their satraps—consisted of a rather narrow strip of land, stretch
ing from the Euphrates and north Babylonia through southern Media and Parsia as far as Arachosia (north-west Afghanistan), and following the course of the great trade-route which from time immemorial had carried the traffic between the west of Asia and India. We still possess a description of this route by Isidore of Charax, probably dating from the Augustan period (in C. Muller, Geographi graeci minores, vol. i.), in which is contained a list of the 18 imperial provinces, known also to Pliny (vi. 112; cf. 41). Isidore, indeed, enumerates nineteen; but, of these, Sacastene formed no part of the Parthian Empire, as has been shown by von Gutmann.

The towns provinces, i.e. the districts west of Parthia are: (1) Mesopotamia, with northern Babylonia, from the Euphrates bridge at Zigurma to Seleucia on the Tigris; (2) Apolloniaitis, the plain east of the Tigris, with Artemita; (3) Charsianitis, the country of the Medes between Upper Mesopotamia and Cambadene, with Bagistana (Behistun)—the mountainous portions of Media; (4) Upper Media, with Ecbatana; (5) Rhagiane or Eastern Media. Then with the Caspian Gates—the pass between Elburz and the Caspian—then Cherest, which lay the route from west Iran to east Iran—the upper provinces begin; (8) Choraene and (9)

1 For the whole of this period see further ANTONIOUS; ANTONIOUS I.–IV.; SELECTUS DYNASTY; HELLENISM.
Comisheh, the districts on the verge of the desert: (10) Hyrcania; (11) Astabene, with the royal town Asaç on the Attruk (see Parthia); (12) Parthiyah with partibus associated, where the sepulchres of the kings were said to have been built; Apavardika, with the capital Kelat; (14) Margane (Merv); (15) Arzab (Keratet); (16) Along. Ashak, which lies in the southern portion of Aria; (17) Zarängeya, the country of the Drangians, on the lake of Hamun; (18) Arachosia, on the Euphrates (Elbelle), called by the Parthians "White India," extending as far as Alexandria (Kandahar), the frontier city of the Parthian Empire.

On the lower Eymander, the Sacae had established themselves in the place of the Scythian tribes—and after them the country was named the Sacae. Sejistan, though it lay the route to Kandahar; and for this reason the district is described by Isodoe, though it formed no part of the Parthian Empire.

Round these provinces lay a ring of numerous minor states, which as a rule were dependent on the Arsacid kings. They might, however, partially transfer their allegiance on the rise of a new power (e.g., Tigranes in Armenia) or a Roman invasion (48 B.C.). Thus it is not without justice that the Arsacid period is described in the later Parsian tradition, as the period of "the kings of the part-kingsdoms"—among which the Askanians (i.e., the Arsacids, from Ashk, the later Asak), on the part of the name Arshaka (Arsaces) had won the first place. This tradition, however, is not without errors in the extreme whole list of kings, which it gives, though it is not unhistorical; only the names of one Balas (e.g., Vologases) and of the last Ardewag (e.g., Ardei) are mentioned. The period preserved by the Parthians ended with the death of Alexander to the Sasana, who was put on the Parthian throne by a Lycian prince, who had ruled the country for 266 years; which was afterwards corrected, after Syro-Grecian evidence, to 523 years. The actual number is 548 years (61 B.C. to A.D. 226). The statements of the Armenian historians as to this period are worth noting.

The ten most important of the vassal states were:

1. The kingdom of Osroene (q.v.) in the north-east of Mesopotamia, with the capital Diocai, founded about 130 B.C. by the chieftain of an Arabian tribe, who established himself there.

2. To this must be added the numerous Arabian tribes of the Mesopotamian desert, under their chieftains, among whom one, Adiabeneetes, came into prominence in the period of Tigranes and Cradaces, and was at one time encouraged by Tigranes, according to Plutarch (Luc. 21) and Pline, Yn. 22. In later times the Arabic town Atra in an oasis on the west of the Tigris, governed by its own kings, gained special importance.

3. The to the Tigris belongs to kingdoms: Gurisalene (or Corydene), the country of the Carduchians, now called the "Gurisalene," a mountainous district north of Armenia; and Adiabene (Hadayb), the ancient Assyria, on either side of the Zab (Lycaus).

4. To the east of Zagros, adjoining Adiabene on the east, was the kingdom of Atropatene in north Media, now often simply called Media (q.v.).

5. While the power of Armenia was at its height under Tigranes (88-71), this state owned his rule. After the victories of Pompey, however, this suzerainty was broken; but, during the next decades and the expeditions of Crassus and Antoninus, it oscillated between Rome and Parthia, though their inclination was decided by the latter. For they were all Orientals and, consciously or unconsciously, desired a change of the Parthian domination. At the same time the loose organization of the Parthian Empire, afforded them a greater measure of independence than they could hope to enjoy under Roman suzerainty.

6. In the south of Babylonia, in the district of Mesene (the modern Mshatun), after the fall of Antiochus Sidetes (129 B.C.), an Arabian prince, Hyspanes or Spasines (in a coin find in Seleucia, about B.C. 103, this prince, called Aspines, founded a kingdom which existed till the time of the Sassanian kings. It was a city (mod. Mohammara), first founded by Alexander on an artificial hill by the junction of the Indus and Kirth, a tribe, and peopled by its veterans. The town, which was originally called Alexandria, was rebuilt by Antiochus I. as Antiochia, was now refortified with dikes by Spasines, and christened Spasinea Charax ("the wall of Spasines") or Spasines or Spasini (Arab. 138 seq.). In the following centuries it was the main mercantile and estuary.

The kingdom of Mesene, also called Characene, known, is known to us by occasional references in various authors, especially (M. Aurelius), where it is mentioned, as well as from numerous coins, dated by the Seleucian era, which allow us to draw up a list of some 240 names. The Arab dynasty speedily assimilated itself to the native population; and most of the kings bear Babylonian— in a few cases Saracene-names. The official language was Greek, till, on the death of Seleucus, an insurrection was raised against the coinage by Aramaic. Another Babylonian dynasty must have been Hadadnadiachus (c. 100 B.C.), who built in Tell the fortified palace which has been excavated by de Sarzec.

7. East of the Tigris lay the kingdom of Elymais (Elam), to which belonged Susa and its modern representative Ahwah, farther to the east, Vales. The Elymaeans, who had already offered a repeated resistance to the Seleucids, were obliged by Mithra dates 1, as we have mentioned before; but they remained a separate state, which often rebelled against the Arsacids (Strabo xvi. 744; cf. Plut. Pomp. 50; Tac. Ann. v. 90). Of the kings of who apparently ruled at Elymais, and was placed at Seleucia by the name Cammeces are known to us from coins dated 81 B.C. held by Mithra, with the Persian language in Aramaic characters, i.e., the so-called Cinesi, who appear as zealous adherents of Zoroastrianism and the Sassanids (see A. Praxis). They were forced, however, to acknowledge the sovereignty of the Parthian kings, and in this last role were the Persians of Cyrus and his forefathers to the Medes (see Strabo xv. 728, 733, 736; Lucian, Macrob. 15). In later times, however, the foundation of the Sassanian dominion, Persis was dislodged from its place as the kingdom of the Sassanids.

8. The district of Persis, also, became important after a time of Antiochus IV., and was ruled by its own kings, who perpetuated the Akadian traditions, and, however, bear the Persian language in Aramaic characters, i.e., the so-called Cinesi, who appear as zealous adherents of Zoroastrianism and the Sassanids (see A. Praxis). They were forced, however, to acknowledge the sovereignty of the Parthian kings, and in this last role were the Persians of Cyrus and his forefathers to the Medes (see Strabo xv. 728, 733, 736; Lucian, Macrob. 15). In later times, however, the foundation of the Sassanian dominion, Persis was dislodged from its place as the kingdom of the Sassanids.

9. The east of Iran—Bactria with Sogdiana, Eastern Arachosia and the Salt Range, all subject to the Arsacids. Here the Greco-Bactrian and Greco-Indo-Scythian kingdom was to be established, and this is the land of the Arsacid, who hold a subject to the Arsacids. Here also the Greek-Bactrian and Greco-Indo-Scythian kingdom was to be established, and this is the land of the Arsacid, who hold a

1 See Saint-Martin, Recherches sur la Mêta et la Characène (1838); Reinaud, Mémoires sur le royama de la Mêta (1861); E. Babelon, "Numism. et chronol. des dynasties de la Characène," in Journ. internat. d'archéol. numism. vol. i. (1868).
create a great and united dominion, such as existed under the Achaemenids and was afterwards restored by the Sassanids. This fact, then, at least, supports the hypothesis that the Persians were the true east of the Parthian "king of kings." In contrast alike with its predecessors and its successors, the Arsacid dominion was peculiarly a chance formation—a state which had come into existence through fortuitous external circumstances, and had no firm foundation within itself, or any intrinsic raison d'être.

Three elements, of widely different kinds, contributed to its origin and defined its character. It was sprung from a predatory nomad tribe (the Parthian Dahae, Scythians) which had established itself in Khorasan (Parthia), on the borders of civilization, and thence gradually spread eastward. Secondly, its political institutions and weakness of its neighbours allowed. Consequently, these nomads were the principal pillar of the empire, and from them were obviously derived the great magnates, with their huge estates and hosts of serfs, who composed the imperial council, led the armies, and the provinces and made and unmade the kings (Strabo xii. 515; Justin xii. 2; the former terming them σημερόν, "kings of the king, the latter, "probus"). Of these great families that of Surena held the privilege of setting the diadem on the head of the new king (Plut. Crass. 21; Tac. Ann. vi. 42). The military organization, moreover, was wholly nomadic in character. The nucleus of the army was formed of armoured horsemen, excellently practised for long-distance fighting with bow and javelin, and thus being mobile also, in their tactics being rather to swarm around the enemy's squadrons and overwhelm them under a hail of missiles. When attacked they broke up, as it seemed, in hasty and complete flight, and having escaped again gathered into new formations, and themselves rapidly reformed and renewed the assault. How difficult it was for infantry to hold their own against these mounted squadrons was demonstrated by the Roman campaigns, especially in broad plains, which the Parthians and their ancient predecessors had habitually been; they would unite their forces to war as well as possible, chiefly servants and bought slaves, who, like the Janissaries and Mamelukes, were trained exclusively for war. Thus Surena, in 53 B.C., is said to have put at the king's disposal 1000 mailed horsemen and 2000 foot soldiers. He also provided his attendants and harem (Plut. Crass. 21; description of the military organization; Dio Cass. 40, 15; Justin xii. 2). In the army of 50,000 mounted men which took the field against Mark Antony there were, says Justin, only 400 infantrymen.

The Parthian Empire is obvious from the fact that, in civil wars, the deposed kings continuously took refuge among the Dahae or Scythians and were restored by them. But, in Parthia, these nomad princes, out of the old nomads, became civil and, with their religion, had adopted their dress and manners. Even the kings, after the first two or three, wear their hair and beard long, in the Iranian fashion, whereas their predecessors are always clean-shaven. The Arsacids are freed from any devotional interest (in contrast to the Achaemenids and Sassanids), they acknowledge the Persian gods and the leading tenets of Zoroastrianism. They erect fire-altars, and even obey the command to abandon all copy, sect or the is axis and Aburan xel; for the union, moreover, recommended by that creed, between brother and sister—and even son and mother—occurs among them. Consequently, beside the council of the nobility, there is a second council of "all the people" (Strabo xii. 515). Again, they perpetuate the traditions of the Achaemenid Empire. The Arsacids assume the title "king of kings" and derive their line from Artaxerxes II. Further, the royal apotheosis, so common among them and regarded under the Sassanids, is most ancient. Nor can we deny to them origin as development of Iranian views. For at the side of the great god Ahuramazda there stands a host of subordinate divine beings who execute his will—among these the defined heroes of legend, to whose circle the king is now admitted, since the Sassanids, too, have been placed in the temple.

This gradual Iranianization of the Parthian Empire is shown by the fact that the subsequent Iranian traditions, and Firdousi in particular, apply the name of the "king of kings" to this or that Parthian king. Consequently, also, the language and writing of the Parthian period, which are retained under the Sassanids, received the name Pahlavi, i.e. "Parthian." The script was derived from the Aramaic.

The Parthian or Median elements are an inescapable part of the dominant world-culture which had penetrated into Parthia and Media. It was indispensable to every state which hoped to play some part in the world and was not so prone to the competition of the West with its science and art. The Arsacids entertained the less thought of opposition as they were destitute of an independent national basis. All their external institutions were borrowed from the Seleucid Empire; their coinage with their Greek inscriptions and nomenclature; their Attic standard of currency; and, doubtless, a great part of their administration also. In the towns Greek merchants were everywhere settled. Mithradates I. even followed the precedent of the Seleucids in building a new city, Arsacia, which replaced the ancient Rhagae (Rai, Europus) in Media. The further the Arsacids expanded the deeper they penetrated into the province of Hellenism; and Mithradates himself assumed, after his great conquests, the title of Philhellene ("friend of Greece"). This partial retention of Hellenism was retained by almost all his successors. Then follow the surnames Epiphanes "the revealed god," Diocas "the just," Enerties the benefactor," all of them essentially Greek in their reference, and, as it were, subtly blended. As to the coinage, when the Ephrates and Tigris provinces it was imperative that the royal residence should be fixed there. But as one ventured to transfer the royal household and the army, with its hordes of wild barbarians, from the Greek to the Parthian sphere, and to legalize its commerce, the Arsacids set up their abode in the great village of Ctesiphon, on the left bank of the Tigris, opposite to Seleucia, which accordingly retained its free Hellenic constitution (see TEPSHON and SELAEICL). So, also, Orosius spoke good Greek, and Greek tragedies were staged at his court (Plut. Crass. 33). In spite of this, however, the rise of the Arsacid Empire marks the beginning of a reaction against Hellenism—not, indeed, a conscious or ascan reaction, but a reaction which was all the more effective because it depended on the impetus of circumstances working with all the power of a natural self-recuperating force. The essential point is that the East is completely separated from the Renaissance, and from the Greek world, that it can derive no fresh powers from the latter, and that, consequently, the influence of the oriental elements must steadily increase. This process can be most clearly traced on the coins—almost the sole memorials that the Parthian Empire has left. From reign to reign the Hellenic elements and pretensions are being more and more neglected, till it becomes obvious that the engraver himself no longer understood Greek but copied mechanically the signs before his eyes, as is the case with the contemporary Indo-Scythian coins. The same thing is said of the great coinage of the Araunic script is occasionally employed. The political opposition to the western empires, the Seleucid first, then the Roman, precipitated this development. Naturally enough the Greek cities were the first to succumb, and the Greco-Persian states in the West were and were ever ready to cast in their lot with such—a disposition for which the subsequent penalty was not lacking. The Parthian magnates, on the other hand, with the army, would have little to do with the Greeks. As a result, the conquerors were contemptuously regarded as effeminate and unmanly. Moreover, they required of their rulers that they should live in the fashion of their country, practise arms and the chase, and appear as Oriental conquerors, not as Greek conquerors.

Thus these tendencies taken together explain the radical weakness of the Parthian Empire. It was easy enough to collect a great army and achieve a great victory; it was absolutely impossible to hold the armaments for any longer period, or to conduct a regular campaign. The Parthian army was not in the hands of a firm, united organization, such as the Achaemenids before them, and the Sassanids after them gave to their empire. The kings themselves were in the hands of the magnates and the army who, tenaciously as they clung to the anointed dynasty of the Arsacids, were utterly indifferent to the person of the individual Arsacid. Every moment they were ready to overthrow the reigning monarch and to seat another on his throne. The kings, for their part, sought protection in craft, treachery and cruelty, and only succeeded in aggravating the situation. More especially they saw an enemy in every prince, and the worst of enemies in their own sons. Sanguinary crimes were thus of everyday occurrence in the royal household. The earliest accounts we have of how the father anticipated the son, or the son the father. The conditions were the same as obtained subsequently under the Mahommedan Caliphat (c.e.) and the empire of the Ottomans. The internal history of the Parthian, or the Parthian domination is an unbroken sequence of civil and  dynamic and satic:

For the literature dealing with the Parthian Empire and numismatics, see PARTHIA, under which heading will be found a complete list of the kings, so far as we are able to reconstitute them.

These conditions elucidate the fact that the Parthian Empire, though founded on annexation and perpetually menaced by hostile arms in both the East and the West, yet never took a strong offensive after the days of Mithradates II. It was bound to protect itself against Scythian aggression in the East and Roman aggression in the West. To maintain, or regain, the suzerainty over Mesopotamia and the vassal states of that region, as also over Atropatene and Armenia, was its most imperative task. Yet it always remained on the defensive and even so was
lacking in energy. Whenever it made an effort to enforce its claims, it retreated so soon as it was confronted by a resolute foe.

Thus the wars between Parthia and Rome proceeded, not from the Parthians—deeply injured though they were by the encroachments of Pompey—but from Rome herself. Thus the war was of the same origin as the war with Antony, though Lucullus, at the height of his successes, entertained the thought (Plut. Luc. 30). But the ambitious men, whose goal was to erect their own sovereignty on the ruins of the republic, took up the project. With this objective M. Licinius Crassus, the triumvir, in 54 B.C., took the aggressive against Parthia, the occasion being favourable owing to the dynastic troubles between Orodos I., the son of Phraates III., and his brother, Orodos II. Crassus fell on the field of Carrhae (June 9, 53 B.C.). With this Mesopotamia was regained by the Parthians, and King Ariavasdes of Armenia now entered their alliance. But, apart from the ravaging of Syria (51 B.C.) by Paeon the son of Orodos, the threatened attack on the Roman Empire was carried into effect neither then nor during the civil wars of Caesar and Pompey. At the time of his assassination Caesar was intent on resuming the expedition of Crassus. The Parthians formed a league with Brutus and Cassius, as previously with Pompey, but gave them no support, until in 40 B.C. a Parthian army, led by Paeon and the republican general Labienus, harried Syria and Asia Minor. But it was easily repulsed by Ventidius Bassus, the lieutenant of Mark Antony. Paeon himself fell on the 9th of June 38 B.C. at Gindaris in northern Syria. Antony then attacked the Parthians in 36 B.C., and penetrated through Armenia into Atropatene, but was defeated by Phraates IV.—who in 37 B.C. had murdered his father Orodos I.—and compelled to retreat with heavy losses. The continuation of the war was frustrated by the conflict with Octavian. Armenia alone was again subdued in 34 B.C. by Antony, who treacherously captured and executed King Ariavasdes. Roman opinion universally expected that Augustus would take up the work of his predecessors, annihilate the Parthian dominion, and subdue the East as far as the Indians, Scythians and Serees (cf. Horace and the other Augustan poets). But Augustus disappointed these expectations. His whole policy and the needs of the newly organized Roman Empire demanded peace. His efforts were devoted to reaching a modus vivendi, by which the authority of Rome and her most vital claims might be peacefully vindicated. This the weakness of Parthia enabled him to effect without much difficulty. His endeavours were seconded by the revolt of Tiridates II., before whom Phraates IV. was compelled to flee (32 B.C.), till restored by the Scythians. Augustus lent no support to Tiridates in his second march on Ctesiphon (26 B.C.), but Phraates was all the more inclined on that account to stand on good terms with him. Consequently in 20 B.C. he restored the standards captured in the victories over Crassus and Antony, and recognized the Roman suzerainty over Osroene and Armenia. In return, the Parthian dominion in Babylonia and the other vassal states was left undisputed. Thus it was due not to the successes and strength of the Parthians but entirely to the principles of Roman policy as defined by Augustus that their empire appears as a second great independent power, side by side with Rome. The precedence of the Caesars, indeed, was always admitted by the Arsacids; and Phraates IV. soon entered into a state of dependency on Rome by sending (9 B.C.) four of his sons as hostages to Augustus—a convenient method of obviating the danger threatened in their person, without the necessity of killing them. In 4 B.C., however, Phraates was assassinated by his favourite wife Musa and her son Phraates V. In the subsequent broils a Parthian faction obtained the release of one of the princes interned in Rome as Vonones I. (A.D. 8). He failed, however, to maintain his position for long. He was a stranger to the Parthian customs, and the feeling of shame at dependency on the foreigner was too strong. So the rival faction brought out another. Arsacid, resident among the Scythian nomads, Artabanus II., who easily expelled Vonones—only to create a host of enemies by his brutal cruelty, and to call forth fresh disorders.

Similar proceedings were frequently repeated in the period following. In the intervals the Parthians made several attempts to reassert their dominion over Armenia and there install an Arsacid prince; but on each occasion they retreated without giving battle so soon as the Romans prepared for war. Only the dynasty of Atropatene was finally deposed and the country placed under an Arsacid ruler. Actual war with Rome broke out under Vologases I. (51-77), who made his brother Tiridates king of Armenia. After protracted hostilities, in which the Roman army was commanded by Cn. Domitius Corbulo, the war was concluded in A.D. 63, confirming the Roman suzerainty over Armenia but recognizing Tiridates as king (see Corbulon). Tiridates himself visited Rome and was there invested with the diadem by Nero (A.D. 66). After that Armenia continued under the rule of an Arsacid dynasty.

These successes of Vologases were counterbalanced by serious losses in the East. He was hampered in an energetic campaign against Rome by attacks of the Dahae and Sacae. Hrycana, also, revolted and asserted its independence under a separate line of kings. A little later, the Alans, a great Iranian tribe in the south of Russia—the ancestors of the present-day Ossets—broke for the first time through the Caucasian passes, and ravaged Media and Armenia—an incursion which they often repeated in the following centuries. On the other side, the reign of Vologases I. is characterized by a great advance in the Oriental reaction against Hellenism. The line of Arsacids which came to the throne in the person of Artabanus II. (A.D. 10) stands in open opposition to the old kings with their leanings to Rome and, at least external, tinge of Hellenism. The new régime obviously laid much more stress on the Oriental character of their state, though Philostaurus, in his life of Apollonius of Tyana (who visited the Parthian court), states that Vardanes I. (A.D. 40-45), the rival king to the brutal Gortazes (A.D. 40-51), was a cultivated man (Vit. Ap. i. 22, 28, 31 sqq.); and Vologases I. is distinguished by the excellent relations which subsisted all his life between himself and his brothers Paeon and Tiridates, the kings of Media and Armenia. But the coins of Vologases I. are quite barbarous, and for the first time on some of them appear the initials of the name of the king in Aramaic letters by the side of the Greek legend. The Hellenism of Seleucia was now attacked with greater determination. For seven years (A.D. 37-43) the city maintained itself in open rebellion (Tac. Ann. xi. 8 seq.), till at last it surrendered to Vardanes, who in consequence enlarged Ctesiphon, which was afterwards fortified by Paeon (A.D. 78-105: v. Ammian. 23, 6, 23). In the neighbourhood of the same town Vologases I. founded a city Volosocrates (Balashkert), to which he attempted to transplant the population of Seleucia (Plin. vi. 122: cf. Th. Neidecke in Zeitschr. d. deutsch. morgn. Gesellschaft, xxviii., 100). Another of his foundations was Volosagisa (the Arabian Ullthal), situated near Hira on the Euphrates, south of Babylon, which did appreciable damage to the commerce of Seleucia and is often mentioned in inscriptions as the destination of the Palmyrene caravans.

After Vologases I. follows a period of great disturbances. The literary tradition, indeed, deserts us almost entirely, but the coins and isolated literary references prove that during the years A.D. 77 to 147, two kings, and sometimes three or more, were often reigning concurrently (cf. Vologases II. 77-79, and 111-147; Paeon 78-c. 105; Osroes 106-129; Mithradates V. 129-147: also Artabanus III. 80-81; Mithradates IV. and his
son Sanatruces II. 115; and Parthamasaptes 116-117). Ob-
viously the empire can never have been at peace during
these years, for it was the period when the most studented empires of Alexander
were fought against the empire of Alexander, and they were to be won for
Western civilization. In pursuance of this plan he reduced Armenia, Mesopotamia and Babylonia to the position of
imperial provinces. On his death, however, the Parthian
immediately reverted to the Augustan policy and restored the
conquests. Simultaneously there arose in the East the powerful
Indo-Scythian empire of the Kushana, which doubtless still
further the Parthian possessions in eastern Iran.

An era of quiet seems to have returned with Vologases III.
(147-191), and we hear no more of rival kings. With the Roman
Empire, peace and war was followed by a profound peace, and the
future of the empire of Rome, for, in its course, Seleucia was
destroyed by the Romans under Avidius Cassius (164). The
downfall of the great Greek city sealed the fate of Hellenism
in the countries east of the Euphrates. Henceforward Greek
literature practically vanished and gives place to Aramaic; it is
significant that in the future the kings of Mesene stamped their
coingage with Aramaic legends. This Aramaic victory was
powerfully aided by the ever-increasing progress of Christianity,
which soon created, as is well known, an Aramaic literature
Chaldaic
of which the language was the dialect of Edessa, a city
in which the last king of Osroene, Abgar IX. (197-214), had been converted to the faith. After that Greek
culture and Greek literature were only accessible to the Orientals
in an Aramaic dress. Vologases III. is probably also
the king Valgash, who, according to a native tradition, preserved in the
Divkarta, began a collection of the sacred writings of
Zoroaster—the origin of the Avesta which has come down to us.
This would show how the national Iranian element in the
Parthian Empire was continually gathering strength.

The Roman war was closed in 165 by a peace which ceded
north-west Mesopotamia to Rome. Similar conflicts took place in
193-202 between Vologases IV. (191-209) and Septimius
Severus, and again in 210-217 between Artabanes IV. (209-226)
and Caracalla. They failed, however, to affect materially the
position of the two empires.

VIII. The Sassanian Empire.—That the Parthian Empire
should have endured some 350 years after its foundation by
Arsaces I. must be attributed to the fact that the parthians,
while possessing a greatly inferior position of internal strength, but of chance working in its
external development. It might equally well have so existed
for centuries more. But under Artabanes IV. the catastrophe
came. In his days there arose in Persis—precisely as Cyrus
had arisen under Astyages the Medes—a great personality.
Ardashir (Artaxerxes) I., son of Papak (Bahak), the descendant of
Sasan, was the sovereign of one of the small states into which
Persia had gradually fallen. His father Papak had taken
possession of the district of Istakhr, which had replaced the old
Persepolis, long a mass of ruins. Thence Ardashir I., who
reigned from about A.D. 212, subdued the neighbouring poten-
tates—disposing of his own brothers among the rest. This
proceeding quickly led to war with his suzerain Artabanes IV.
The conflict was protracted through several years, and the
Parthians were worsted in three battles. The last of these
witnessed the fall of Artabanes (A.D. 226), though a Parthian
king, Artavases—perhaps a son of Artabanes IV.—who is
only known to us from his own coins, appears to have retained a
portion of the empire for some time longer. The members of
the Arsacid line who fell into the hands of the victor were put
to death; a number of the princes found refuge in Armenia,
where the Arsacid dynasty maintained itself till A.D. 429.
The remains of the vassal states—Carmania, Susiana, Mesene
were ended by Ardashir; and the autonomous desert fortress
of Hatra in Mesopotaonia was destroyed by his son Shapur
(Sapor I., according to the Persian and Arabian traditions,
which, in this point, are deserving of credence. The victorious
Ardashir then took possession of the palace of Ctesiphon and
assumed the title "King of the kings of the Iranians" (βασιλεὺς
βασιλέων Ἀραμών).

The new empire founded by Ardashir I.—the Sassanian,
or Neo-Persian Empire—is essentially different from that of
his Arsacid predecessors. It is, rather, a continua-
tion of the Achaemenid traditions which were still
alive on their native soil. Consequently the national
impetus—already clearly revealed in the title of the new
sovereign—again becomes strikingly manifest. The Sassanian
Empire, in fact, is once more a national Persian or Iranian
Empire. The religious element is, of course, inseparable
from the national, and Ardashir, like all the dynasts of Persis,
was an ardent devotee of the Zoroastrian doctrine, and closely
connected with the priesthood. In his royal style he assumed
the designation "Mazdayasani" (Μαζδαγνας), and the fire-
cult was everywhere vigourously disseminated. Simultaneously
the old claims to world dominion made their reappearance.

After the defeat of Artabanes, Ardashir, as heir of the Acha-
emenid dynasty, formulated his pretensions to the dominion over
western Asia (Dio. Cass. 80, 3; Herod. vi. 2, 4; Zonar. xii. 13; similarly
under Shapur II.: Ammian. Marc. xvii. 5, 9). He attacked
Armenia, though without permanent success (cf. von Gutschmid
in Zeitschr. d. d. morgent. Ges. xxxi. 47, on the fabulous Armenian
account of these wars), and despatched his armies against
Roman Mesopotamia. They stayed as far as Syria and Cappadocia.
The inner decay of the Roman Empire, and the
widespread tendency of its troops to mutiny and usurpation,
favoured his enterprise. Nevertheless, the armies of Alexander
Severus, supported by the king of Armenia, succeeded in repelling
the Persians, though the Romans sustained severe losses (231-
233). Towards the end of his reign Ardashir resumed the attack;
while his son Shapur I. (241-272) reduced Niabis and Carrhae
and penetrated into Syria, but was defeated by
Gordian III. at Resaena (243). Soon afterwards,
however, the Roman Empire seemed to collapse utterly.
The Goths defeated Decius (251) and harried the Balkan Peninsula
and Asia Minor, while insurrections broke out everywhere and
the legions created one Caesar after the other. Then Shapur
resumed the war, subdued Armenia and plundered Antioch.
The emperor Valerian, who matched to encounter him, was
overthrown at Edessa and taken prisoner (260). The Persian
armies advanced into Cappadocia; but here Ballista or Balista
(d. c. 264) beat them back, and Odenathus (Othalath), prince of
Edessa (d. 265), rose in their rear, defeated Shapur, captured his
harem, and twice forced his way to Ctesiphon (263-265).
Shapur was in no position to repair the defeat, or even to hold
Armenia; so that the Sassanian power failed to pass the bounds of the
Arsacid Empire. Nevertheless Shapur I., in contrast to his father, assumed the title "King of the kings of the
Iranians and non-Irarians" (βασιλεὺς βασιλέων Ἀραμών καὶ Ἀραμῶν;
shah an shah Iran wa Amiran), thus emphasizing his claim to
world dominion. His successors retained the designation,
little as it corresponded to the facts, for the single non-Iranian
land governed by the Sassanids was, as under the Parthians,
the district of the Tigris and Euphrates as far as the Mesopo-
tamian desert; western and northern Mesopotamia remained
Roman.

The Sassanian ruler is the representative of the "Kingly Majesty,"
derived from Ormuzd, which appears in the Avesta as the angel
Kavæm Hvaræn, 'the royal glory;' and, according to
Christian legend, as the one who beamed down during the
sacrifice by the wise king Zoroaster, and quickly put all but those of royal blood. A picture, which frequently recurs in the rock-reliefs of Ardashir I. and Shapur I., represents
the king and the god Ormuzd both on horseback, the latter in the
act of handing to his companion the ring of sovereignty. Thus it
is explicable that all the Sassanids, as many of the Arsacids before
them, include the designation of "god" in their formal style.
From this developed (as already under the Arsacids) that strict
imperium which is still vigorous in Firdausi. It
applies, however, to the whole royal house, precisely as in the
Ottoman Empire of to-day. The person of the individual ruler
is, on the other hand, a matter of indifference. He can readily be removed and replaced by another; but no usurper who was not of the legitimate blood can hope to become the genuine king. Therefore the native tradition carries the Sassanian line back to the Achaemenids. It was a family tree which stretched back farther than any other in the east.

Officially the king is all-powerful, and his will, which is guided by God and bound up in His law, is unchallenged. Yet, externally, he is surrounded by all the splendour of sovereignty; on his head he wears a great and resplendent crown, which he appends to his person in a piece of gold and jewels; round him is a brilliant court, composed of his submissive servants. He sits in dazzling state on his throne in Ctesiphon. All who approach fling themselves to the ground, and life and death depend on him; his people he is accounted the fairest, strongest and wisest man of the empire; and from him is required the practice of all piety and virtue, as well as skill in the chase and arms—especially the bow. Ardashir I., moreover, and his successors endeavoured to extend the territory of the Sassanids, and thus to join the various states and instituting a firmer organization. Nevertheless they failed to attain the complete independence and power of the Achaemenids. Not strong enough to break up the nobility, with its great armament, they had to defend the realm against the Sassanids. This fact, again, is most closely connected with its military and administrative organization. The external and internal conditions of the empire are in mutual reaction upon one another. The rapid expansion of the Sassanian power, the unending rivalry and struggle between Sassanid and Parthian, and the need of the Sassanids to maintain and pay a large army for any length of time. Thus the great host soon melted away, and a war, begun successfully, ended ingloriously, and often disastrously. Under such circumstances, the Sassanian army became the mainstay of the empire, the model for further conquests, though its army was capable and animated by a far stronger national feeling than that of the Parthians. It still consisted, however, of levies from the multitude of the qualities led by their territorial lords, and, although these troops were not victorious, of the Parthians. As a result, the Sassanian army retained its tactical and strategic superiority. A great victory might be won—even an emperor might be captured, like Valerian—but immediately afterwards successes, such as those gained by Ardashir I. and Shapur I. and III., were impossible. The defeat of Ballista and Odenathus of Palmyra, or the later victories of Carus, Julian and others, demonstrated how far the Persians were from being on an equality with the Romans. That Babylonia permanently remained a part of the Sassanian empire, regardless of geographical conditions and to the political situation of the Roman Empire, was not the strength of the Persians.

Among the magnates six great houses—seven, if we include the royal houses—were ranked under the Achaemenids, and from these were drawn the generals, crown officials and governors (cf. Procop. Pers. i. 6, 13 sqq.). In the last of these positions we find both Sassanian and Parthian names. Among the seven houses only one, that of Ballista, was of Parthian extraction. Most of these houses—those of the Sassanids—were drawn from the royal households (shah). Some of these houses—those of the clergy—their legends derive from the Persian Gathaspas (i.e. Vistaspas), the protector of Zoroaster (Marquart, Zeitschr. d. d. morgenl. Ges. xliii. 635 sqq.), already existed under the Sassanids (Cahen, Tac. Ann. xii. 12 sqq.), who had obviously embraced the cause of the victorious monarchy at the correct moment and so retained their position. The name Pahlavon, moreover, which denoted the Parthian magnates, passed over into the new empire. Under the Sassanids, the nobility, the dekans ("village-lords") and the "knights" (amor); who, as among the Parthians, took the field in heavy scale-armour. To an even greater extent than

under the Arsacids the empire was subdivided into a host of small provinces, at the head of each being a Marzban ("boundary lord," "lord of the marches"). These were again comprised in four great districts. With each of these local potentates the king could make promises or assignments; he could, moreover, provide for the benefit of each and every one that he had the power or understood the art of making himself feared. But to break through the system or replace it by another was impossible. In fact he was compelled to proceed with great caution, and to make sure that the laws were correctly administered, in order to procure the encroachments of the nobility, to protect the community, and, above all, to carry out a just system of taxation.

Side by side with the nobles ranked the spiritual chiefs, now a far more powerful body than under the Arsacids. Every larger town had its own bishop (magos, magus, "Lord of the Magians"). At their head was the supreme Maged, resident in Rhaiae (Rai), who was regarded as the successor of Zoroaster. In the new empire, if we judge from the writings of the Persian historians, and from the general development of the true faith, their influence was extraordinarily strong (cf. Agathias ii. 26)—comparable to the influence of the priesthood in later Egypt, and especially in Byzantium and medieval Christendom. As has been pointed out, however, there is no essential difference between the Persian-religion (cf. especially H. Gellert, "Einb. u. d. Entwickelung des pers. Religions-systems") in the Zeitschr. f. armen. Philol. i. 149 sqq.).

The Persian religion, as we have seen, spread more and more with the Sassanian or Parthian power, and penetrated into all the other countries of the eastern world. The Persians were zealous worshippers; in Armenia the old national religion was almost entirely banished by the Persian cults (Gellert, "Zur armen. Götterlehre," in Ber. d. d. Gesch. d. Alterthumwiss. i. 26). In Asia Minor, the Persian gods were everywhere adored side by side with the native deities. It was in the third century that the cult of Mithras, with its mysteries and a theology evolved from Zoroasterian and Gnostic elements, began to penetrate into the Roman provinces of the Roman empire; and it even seemed for a while as though the Sol invictus Mithras, highly favoured by the Caesars, would become the official deity-of the empire. But in all these cults the Persian gods are perfectly blended with others native or foreign divinities; vigorous as was their propaganda, it was yet equally far removed from an attack on other creeds. Thus this Parseesim always bears a syncretic character; and the supreme god of Zoroastrian theory, Ahura Mazda (i.e. Zeus or Jupiter), in praeterhistorical times, was lost, and is at last ascribed to the same god as Baal. The King is the god of the Persians, and are able to lead the believer, who has been initiated and keeps the commandments of purity, to salvation.

But, meanwhile, in its Iranian home and especially in Persia, the Persian religion was already disturbed by the preoccupations of the outside world. Here the poems of the prophet and fragments of ancient religious literature survived, understood by the Magians and rendered accessible to the faithful by the version in the modern dialect (Pahlavi). Here the Magians and the Zoroastrians between the good spirit of light and the demons of evil—between Ormuzd and Ahirman—still remained the principal gods of the creed; while all other gods and angels, however estimable their aid, were subsumed under the name of Ormuzd and Ahirman. Where the new influence was not the sun-god Mithras, but the holy fire guarded by his priests. Here all the prescriptions of purity—partly connected with national customs, and impossible of execution abroad—were abolished, and even the "hearth" (or hearth) was polluted by the earth with corpses, but to cast out the dead to vulture and dog, was obeyed in its full force. At the same time the Persians preserved his character as a national god, who bestowed on his devotees the Ascended, or the "hearth," and who remained, regarded, as the God of Air. He was the intermediary between the Sassanids, as also in Armenian traditions, he appears on horseback as a war-god. Here, again, the theology was further developed, and an attempt was made to annul the old dualism by envisaging both Zoroastrianism and Buddhism as emanations of an original principle of infinite time (Zervan), a doctrine which long enjoyed official validity under the Sassanids till, in the reign of Chosroes I., the sect of Zervanites was pronounced heretical. If, above all, the ritual and the dogma were subjected to a change, and expanded, the Sassanian system of courts evolved a complete and detailed system of courts, dealing with all things allowed and forbidden, the forms of pollution and the repulsion for each, of which, in its arid and spiritless monotonous vividly recalls the similar prescriptions in the Pentateuch. That a general framework of impartiality and literal obedience to all priestly injunctions now assumed an importance far greater than previously; henceforward, the great commandent of Zoroastrianism, as of Judaism, is to combat the heresies

1 It may be observed that this innovation was also known to the Mithras-cult of the West, where Zervas appears as alsor.
of the heathen, a movement which had already an energetic representative in the prophet himself. Heathenish cults and forbidden manners and customs are a pollution to the land and a deep insult to the true God. Therefore the duty of the believer is to completely conform to the belief of the Achaemenids and suppress the whole idea of the irreligion.

In the course of time, the tolerance of the Achaemenids and the indifference of the Christians are now replaced by intolerance and religious persecution. The Persian Empire was divided into two parts: the sovereign authority of the Sasanian Empire, and the independent existence of the Christian Churches. While the Sasanian Empire maintained the Christian Church as a separate entity, the Christian Churches maintained their own autonomy and independence. This resulted in a gradual decline of the Sasanian Empire and the rise of the Christian Churches.

In Persia, the rule of Manichaeism, a Christian sect, was established. It was a complex religious and political movement that blended elements of Christianity, Zoroastrianism, and Manichaeism. Manichaeism was a cult that was founded by Mani, a Persian mystic, in the 3rd century AD. It was characterized by a dualistic worldview, with a struggle between good and evil. Manichaeism gained significant influence in Persia, and the Sasanian Empire tolerated it as a competing religious alternative to Christianity.

The Sasanian Empire, under the leadership of its kings, followed a policy of tolerance and religious freedom. This allowed for the coexistence of different religious communities within the empire. However, this policy was gradually replaced by a more aggressive approach, which resulted in the suppression of Christian and other religious communities.

The Sasanian Empire was reunified by the Persian Empire, and its capital was shifted to Ctesiphon. Under the rule of the Sasanian Empire, Persia became a center of trade, culture, and learning. The empire's influence extended far beyond its borders, and it played a significant role in the development of the Islamic world.

The Sasanian Empire also faced challenges from other empires, including the Byzantine Empire. These conflicts resulted in the eventual decline of the Sasanian Empire and the rise of the Muslim Empire.

In conclusion, the Sasanian Empire was a significant player in the history of Persia. It played a role in the development of Christianity and other religious communities, and it was a center of trade and culture. However, the empire faced challenges from other empires, and its eventual decline resulted in the rise of the Muslim Empire.
remained as old, the defense and, when possible, the expansion of the eastern and western frontiers. In the first two centuries of the Sassanian Empire we hear practically nothing of its relations with the East. Only occasional notices show that the inroads of the Oriental nomads had not ceased, and that the extent of the empire had by no means exceeded the bounds of the Parthian dominion—Sacaastene (Seistan) and western Afghanistan. Far to the east, on both sides of the Indus, the Kusana Empire was still in existence, though it was already hastening to decay, and about A.D. 320 was displaced from its position in India by the Gupta dynasty. In the west the old conflict for Osroene and northern Mesopotamia (now Roman provinces), with the fortresses of Edessa, Carrhae and Nisibis, still smouldered. Armenia the Sassanids were all the more eager to regain, since there the Arsacid dynasty still survived and turned for protection to Rome, with whom, in consequence, new wars perpetually broke out. In the reign of Bahram II. (276–293), the emperor Carus, burning to avenge the disaster of Valerian, penetrated into Mesopotamia without meeting opposition, and reduced Coche (near Seleucia) and Ctesiphon; but his sudden death, in December of 283, precluded further success, and the Roman army returned home. Bahram, however, was unable to effect anything, as his brother Hormizd was in arms, supported by the Sacae and other tribes. (Mamertin, Panegyr. Maximin. 7, 10; Genethl. Maximin. 5, 17.) He chose, consequently, to buy peace with Diocletian by means of presents. Some years later his uncle and successor, Narses, after subduing his rival Bahram III., occupied Armenia and defeated the emperor Galerius at Callinicum (296). But in the following year he sustained a severe reverse in Armenia, in which he lost his war-chest and harem. He then concluded a peace, by the terms of which Armenia remained under Roman suzerainty, and the steppe districts of northern Mesopotamia, with Singara and the hill-country on the left bank of the Tigris as far as Gordyene, were ceded to the victor (Ammian. Marc. xxv. 7, 9; Petr. Patr. fr. 13, 14; Rufus brev. 25). In return Narses regained his household. This peace, ratified in 297 and completely expelling the Sassanids from the disputed districts, lasted for forty years.

For the rest, practically nothing is known of the history of the first six successors of Shapur I. After the death of Hormizd II. (302–310), the son of Narses, the magnates imprisoned or put to death his adult sons, one of whom, Hormidas, later escaped to the Romans, who used him as a pretender in their wars. Shapur II., a posthumous child of the late king, was then raised to the throne, a proof that the great magnates held the sovereignty in their own hands and attempted to order matters at their own pleasure. Shapur, however, when he came to manhood proved himself an independent and energetic ruler.

Meanwhile the Roman Empire had become Christian, the sequel of which was that the Syro-Christian population of Mesopotamia and Babylonia—even more than the Hellenic cities in former times—gravitated to the west and looked to Rome for deliverance from the infidel yoke. On similar grounds Christianity, as opposed to the Mazdaisim enforced officially by the Sassanids, became predominant in Armenia. Between these two great creeds the old Armenian religion was unable to hold its own; as early as A.D. 294 King Tiridates was converted by Gregory the Illuminator and adopted the Christian faith. For this very reason the Sassanian Empire was the more constrained to champion Zoroastrianism. It was in the year 320 that the completion of the Avesta was completed and the state orthodoxy perfected by the chief mobed, Aturpad. All heresy was proscribed by the

state, defection from the true faith pronounced a capital crime, and the persecution of the heterodox—particularly the Christians—began (cf. Sachall, "Die rechtlichen Verhältnisse der Christen in Sassanidenreich" in Mitteilungen des Vereins für orientalische Sprachen für Berlin, Bd. XI., Abt. 2, 1907). Thus the duel between the two great empires now becomes simultaneously a duel between the two religions.

In such a position of affairs a fresh war with Rome was inevitable. It was begun by Shapur in A.D. 337, the year that saw the death of Constantine the Great. The conflict centred round the Mesopotamian fortresses; Shapur thrice besieged Nisibis without success, but reduced several others, as Amida (350) and Singara (360), and transplanted great masses of inhabitants into Susiana. The emperor Constantius conducted the war feebly and was consistently beaten in the field. But, in spite of all, Shapur found it impossible to penetrate deeper into the Roman territory. He was hampered by the attack of nomadic tribes in the east, among whom the Chinotes now begin to be mentioned. Year after year he took the field against them (353–358), till finally he compelled them to support him with auxiliaries (Amman. Marc. 14, 3; 16, q. 17, 5, 18, 4, 6).

With this war is evidently connected the foundation of the great town New-Shapur (Nishapur) in Khorasan.

By the resolution of Julian (363) to begin an energetic attack on the Persian Empire, the conflict, after the lapse of a quarter of a century, assumed a new phase. Julian pressed forward to Ctesiphon but succumbed to a wound; and his successor Jovian soon found himself in such straits, that he could only extricate himself and his army by a disgraceful peace at the close of 363, which ceded the possessions on the Tigris and the great fortress of Nisibis, and pledged Rome to abandon Armenia and her Arsacid protectorate, Arsaces III., to the Persians.

Shapur endeavoured to occupy Armenia and introduce the Zoroastrian orthodoxy. He captured Arsaces III. by treachery and compelled him to commit suicide; but the Armenian magnates proved refractory, placed Arses’ son Pap on the throne, and found secret support among the Romans. This all but led to a new war; but in 371 Valens sacrificed Pap and had him killed in Tarsus. The subsequent invasions of the Goths, in battle with whom Valens fell at Adrianople (375), definitely precluded Roman intervention; and the end of the Armenian troubles was that (c. 390) Bahram IV. and Theodosius the Great concluded a treaty which abandoned the extreme west of Armenia to the Romans and confirmed the remainder in the Persian possession. Thus peace and friendship could at last exist with Rome; and in 408 Yazdegerd I. contracted an alliance with Theodosius II. In Armenia the Persians immediately removed the last kings of the house of Arses (430), and thenceforward the main portion of the country remained a Persian province under the control of a marzban, though the Armenian nobles still made repeated attempts at insurrection. The introduction of Zoroastrianism was abandoned; Christianity was already far too deeply rooted. But the sequel to the Roman sacrifice of Armenian interests was that the Armenian Christians now seceded from the orthodoxy of Rome and Constantinople, and organized themselves into an independent national church. This church was due, before all, to the efforts of the Catholicos Sahak (390–439), whose colleague Mesrob, by his translation of the Bible, laid the foundations of an Armenian literature (see ARMENIAN CHURCH).

In the interior of the Sassanian Empire the old troubles broke out anew on the death of Shapur II. (379). At first the magnates raised his aged brother Ardashir II. to the throne, then in 383 deposed him and chose his successor as Shapur III. In 388, however, he was assassinated, Yazgedel I. as was also his brother, Bahram IV., in 399. But the son of the latter, Yazdegerd I. (390–420), was an energetic and intelligent sovereign, who held the magnates within bounds and severely chastised their attempts at encroachment. He even sought to emancipate himself from the Magian Church,
HISTORY: ANCIENT

PERSIA

put an end to the persecutions, and allowed the Persian Christians an individual organization. In the Persian tradition he is consequently known as "the sinner." In the end he was probably assassinated. So great was the bitterness against him that the magnates would admit none of his sons to the throne. One of them, however, Bahram V., found an auxiliary in the Arab chief Mondhir, who had founded a principality in Hira, west of the lower Euphrates; and, as he pledged himself to govern otherwise than his father, he received general recognition. This pledge he redeemed, and he is, in consequence, the darling of Persian tradition, which bestows on him the title of Gor ("the wild ass"), and is eloquent on his adventures in the chase and in love. This reversal of policy led to a Christian persecution and a new war with Rome. Bahram, however, was worsted; and in the peace of 422 Persia agreed to allow the Christians free exercise of their religion in the empire, while the same privilege was accorded to Zoroastrianism by Rome. Under his son, Yazdegerd II. (438-457), who once more revived the persecutions of the Christians and the Jews, a short conflict with Rome again ensued (441); while at the same time war prevailed in the east against the remnants of the Kushan Empire and the tribe of Kidarites, also named Huns.

A new foe soon arose in the shape of the Ephthalites (Hashtah), also known as the "White Huns," a barbaric tribe which shortly after A.D. 450 raided Bactria and terminated the Kushana dominion (Procop. Pers. i. 3). These Ephthalite attacks harassed and weakened the Sassanids, exactly as the Tocharians had harassed and weakened the Arsacids after Phraates II. Peroz (457-484) fell in battle against them; his treasures and family were captured and the country devastated far and near. His brother Balash (484-488), being unable to repel them, was deposed and blinded, and the crown was bestowed on Kavadh I. (488-531), the son of Peroz. As the external and internal distress still continued he was dethroned and imprisoned, but took refuge among the Ephthalites and was restored in 490 by their assistance—like so many Arsacids by the arms of the Dahae and Sacae. To these struggles obviously must be attributed mainly the fact that in the whole of this period no Roman war broke out. But, at the same time, the religious duel had lost in intensity, since, among the Persian Christians, the Nestorian doctrine was now dominant. Peroz had already favoured the diffusion of Nestorianism, and in 483 it was officially adopted by a synod, after which it remained the Christian Church of the Persian Empire, its head being the patriarch of Seleucia—Ctesiphon.

Kavadh proved himself a vigorous ruler. On his return he restored order in the interior. In 502 he attacked the Romans and captured and destroyed Amida (mod. Diarbekr), but was compelled to ratify a peace owing to an inroad of the Huns. Toward the close of his reign (527) he resumed the war, defeating Bellarius at Callinicum (531), with the zealous support of the wild Arab Mondhir of Hira. On his death his son Chosroes I. concluded a peace with Justinian (532), pledging the Romans to an annual subsidy for the maintenance of the Caucasus fortresses. In his home policy Kavadh is reminiscent of Yazdegerd I. Like him he had little inclination to the orthodox church, and favoured Mazdak, the founder of a communist sect which had made headway among the people and might be used as a weapon against the nobles, of whom Mazdak demanded that they should cut down their luxury and distribute their superfluous wealth. Another feature of his programme was the community of wives. The cross-union, Chosroes was, on the other hand, wholly orthodox; and, toward the close of his father's reign, in conjunction with the chief Magian, he carried through the sacrifice of the Mazdakites, who were butchered in a great massacre (528). Chosroes I. (531-579), surnamed Anushirvan ("the blessed"), then restored the orthodox doctrine in full, publishing his decision in a religious edict. At the same time he produced the official exposition of the Avesta, an exegetical translation in the popular tongue (Pahlavi), and declared its contents binding. Defection from Zoroastrianism was punished with death, and therefore also the proselytizing of the Christians, though the Syrian martyrology proves that the kings frequently ignored these proceedings so long as it was at all possible to do so.

Chosroes I. was one of the most illustrious sovereigns of the Sassanian Empire. From him dates a new and equitable adjustment of the imperial taxation, which was later adopted by the Arabs. His reputation as an enlightened ruler stood so high that when Justinian, in 530, closed the school of Athens, the last Neoplatonists bent their steps to him in hopes of finding in him the true philosopher-king. Their disillusionment, indeed, was speedy and complete, and their gratitude was great, when, by the conditions of the armistice of 549, he allowed their return. From 540 onward he conducted a great war against Justinian (577-593), which, though interrupted by several armistices, lasted till the fifty years' peace of 562. The net result, indeed, was merely to restore the status quo, but during the campaign Chosroes sacked Antioch and transplanted the population to a new quarter of Ctesiphon (540). He also extended his power to the Black Sea and the Caucasus; on the other hand, a siege of Edessa failed (544). A second war broke out in 572, chiefly on the question of Armenia and the Caucasus territory. In this Chosroes ravaged Cappadocia in 575; but the campaign in Mesopotamia was unsuccessful. In the interval between these two struggles (570) he despatched assistance to the Arabs of Yemen, who had been assailed and subdued by the Abyssian Christians; after which period Yemen remained nominally under Persian suzerainty till its fate was sealed by the conquests of Mahomet and Islam.

Meanwhile, about A.D. 560, a new nation had sprung up in the East, the Turks. Chosroes concluded an alliance with them against the Ephthalites and so compelled Bactria south of the Oxus, with its capital Balkh. Thus this province, which, since the inscription of Diodotus in 250 B.C., had undergone entirely different vicissitudes from the rest of Iran, was once more united to an Iranian Empire, and the Sassanian dominions, for the first time, passed the frontiers of the Arsacids. This, however, was the limit of their expansion. Neither the territories north of the Oxus, nor eastern Afghanistan and the Indus provinces, were ever subject to them. That the alliance with the Turks should soon change to hostility and mutual attack was inevitable from the nature of the case; in the second Roman war the Turkish Khan was leagued with Rome.

Chosroes bequeathed this war to his son Hormizd IV. (579-590), who, in spite of repeated negotiations, failed to re-establish peace. Hormizd had not the ability to retain the authority of his father, and he further afforded the Magian priesthood by declining to proceed against the Christians and by requiring that, in his empire, both religions should dwell together in peace. Eventually he succumbed to a conspiracy of his magnates, at whose head stood the general Bahram Cobin, who had defeated the Turks, but afterwards was beaten by the Romans. Hormizd's son, Chosroes II., was set up against his father and forced to acquiesce in his execution. But immediately new risings broke out, in which Bahram Cobin—though not of the royal line—attempted to secure the crown, while simultaneously a Prince Bistam entered the lists. Chosroes fled to the Romans and the emperor Maurice undertook his restoration at the head of a great army. The people flocked to his standard; Bahram Cobin was routed (591) and fled to the Turks, whom he slew, and Chosroes once more ascended the throne of Ctesiphon; Bistam held out in Media till 596. Maurice made no attempt to push the advantage of his victory, and in the peace then concluded he even abandoned Nisibis to the Persians.

Chosroes II. (590-628) is distinguished by the surname of Parvis ("the conqueror"), though, in point of fact, he was immeasurably inferior to a powerful sovereign like his grandfather, or even to a competent general. He lived, however, to witness unparalleled vicissitudes of fortune. The assassination
The most important works on the monuments are: Flandin et Coste, Voyage en Perse (6 vols., 1840 sqq.); Texier, L’Arabie, la Perse, et la Mesopotamie (2 vols., 1842); Stodze, Perspolis (2 vols., 1882); Sarre, Iranische Reiseberichte (1898).

For works on the external history of Persia see those quoted under articles on Persian kings; also Rome; Greece; Egypt; Syria; etc.

B.—Transition Period: from the Fall of the Sassanid Dynasty to the Death of Timur (1405).

With the final defeat of the Sassanids under Yazdegerd III at the battles of Kadisiya (Kadesia) (637) and Nehavend (641), Persia ceased to exist as a single political unit. The country passed under a succession of alien rulers who cared nothing for its ancient institutions or for its religion. For about 150 years it was governed, first from Medina and afterwards from Bagdad, by officers of the Mahomedan caliphs whose principal aim it was to destroy the old nationality by the suppression of its religion. The success of this policy was, however, only apparent, especially in Iran, the inhabitants of which adopted Islam only in the most superficial manner, and it was from Persia that the blow fell which destroyed the Omayyad caliphate and set up the Abbasids in its place (see CALIPHATE). Even before this event adventurers and dissatisfied Moslem officers had utilized the slumbering hostility of the Persian peoples to aid them in attacks on the caliphs (e.g. Ziyad, son of Abu Sofian, in the reign of Moawiya I.), and the policy of eastern expansion brought the Arab armies perpetually into the Persian provinces.

In the reign of Merwan I., the Persians (who were mostly Shi’ites) under a Moslem officer named Mokhtar (Mukhtar), whom they regarded as their mahdi, vainly attempted to assert their independence in Kufa, but were soon defeated. This rising was followed by many more (see CALIPHATE: § B) in which the caliphs were generally successful, and Abdaimalik (d. 705) considerably strengthened the Moslem power by instituting a thorough system of Moslem coins and enforcing Arabic as the official language throughout the empire. In the succeeding reign Persia was further subdued by the great conqueror Qoteiba (Qotaiba) b. Moslim, the Arabic governor of Khurasan. Omar II., however, extended to non-Arabic Moslem immunity from all taxes except the zakat (poor-rate), with the result that a large number of Persians, who still smouldered under their defeat under Mukhtar, embraced Islam and drifted into the towns to form a nucleus of sedition under the Shi’ite preachers. In the reign of Yazid II. (720–744) serious risings took place in Khurasan, and in spite of the wise administration of his successor Hisham (d. 743), the disorder continued to spread, fanned by the Abbasids and the Shi’ite preachers. Ultimately in the reign of Merwan II. the non-Arabic Moslems found a leader in Abu Moslim, a ma’ula (client) of Persian origin and a champion of Ibrahim b. Mahommed b. Ali, the Shi’ite imam, who raised a great army, drove the caliph’s general Nasr b. Syyar into headlong flight, and finally expelled Merwan. Thus the Abbasids became masters of Persia and also of the Arab Empire. They had gained their success largely by the aid of the Persians, who began thenceforward to recover their lost sense of nationality; according to the Spanish author Ibn Hazm the Abbasids were a Persian dynasty which destroyed the old tribal system of the Arabs and ruled despotically as Chosroes had done. At the same time the Khurasanians had fought for the old Alid family, not for the Abbasids, and with the murder of Abu Moslim discontent again began to grow among the Shi’ites (q.v.). In the reign of Harun al-Rashid disturbances broke out in Khorasan which were temporarily appeased by a visit from Harun himself. Immediately afterwards Rabi’ b. Laith, grandson of the Omayan general Nasr b. Sa’id, revolted in Samarkand, and Harun on his way to attack him died at Tus (803). Harun’s sons Amin and Mamun quarrelled over the succession; Amin became caliph, but Mamun by the aid of Tahir b. Hosain Dhu ‘L-Yaminain (“the man with two right hands”) and others succeeded in deposing and killing him. Tahir ultimately (820) received the governorship of Khurasan, where he succeeded in establishing
a practically independent Moslem dynasty (the Tahirids) which ruled until about 873 in nominal obedience to Bagdad. From 825 to about 898 a similar dynasty, the Dulaflids or Dolafids reigned nominally as governors under the caliphs till they were put down by Motamid. In the reign of the caliph Motasim a serious revolt of Persian Mazdakite sectaries (the Khorrani) in alliance with Byzantium was with difficulty suppressed, as also a rising of Tabaristan under an hereditary chief Maziyar who was secretly supported by the Turkish mercenaries (e.g., Afsin) whom the caliph had invited to his court. To another Turk, Itakh, the caliph Wathiq gave a titular authority over all the eastern provinces. In the reign of the tenth caliph Motawakkil the Tahirids fell before Yakub b. Laith al-Saffar, who, with the approbation of the caliph founded a dynasty, the Saffarid (g.?), in Seistan.

It is convenient at this point to mention several other minor dynasties founded by nominal governors in various parts of Persia and its borderland. From 879 to about 930 the Sahids ruled in Azerbaijan, while in Tabaristan an Alid dynasty (the Zaidites) was independent from 864 to 928, when it fell before the Samanids. Subsequently descendants of this house ruled in Dailam and Gilan. Throughout this period the caliphate was falling completely under the power of the Turkish officers. Mohtadi, the fourteenth Abbasid caliph, endeavoured vainly to replace them by Persians. (the Abna). His successor Motamid was attacked by the Saffarid Yakub who however was compelled to flee (see CALIPHATE: C, § 13). Yakub’s brother Amr (reigned 879–900) received the vacant position, but was taken prisoner by Isma’il b. Ahmad, the Samanid, and by the Saffarids and subsequently consolidated the power of the stream of the Alids in Tabaristan. The Samanids, and the Saffarids were the first really important non-Arabic Persian dynasty since the fall of Yazgeddl III. They held sway over most of Persia and Transoxiana, and under their rule scholarship and the arts flourished exceedingly in spite of numerous civil wars. Ultimately they fell before the Ghaznevid dynasty of Sabuktigin.

In the reign of Motadid (CALIPHATE: C, § 16) who, as we have seen, put down the Dolafids, and also checked the Sahids of Azerbaijan in their designs on Syria and Egypt, the Khorrizites of Mesopotamia were put down by the aid of the Hamdanites of Mosul, who were to become an important dynasty (see below). Subsequently the caliphate, which had temporarily recovered, sank under the weight of its own decay. In the last period of the Caliphate the whole structure of the caliphate was a mere shadow, and the great families of Persia once again asserted themselves. In the reign of Qahir (d. 934), a new dynasty arose in Persia, that of the Buyids (Buwayhids). This family was descended from one Abu Shaja Buya, who claimed to be of the old Sassanian house and had become a chieftain in Dailam. He had successively fought for the Samanids and the Ziyarids, a dynasty of Jorjan, and his son Imad addaula (ed-dowleh, originally Abu ‘l Hasan Ali) received from Mardawij of the latter house the governorship of Karaj; his second son Rokn addaula (Abu Ali Hasan) subsequently held Rais and Isfahan, while the third, Moizz addaula (Abu ‘l Hosain Ahmad) secured Kermân, Alvanz and eventually Bagdad. The rich reward of the caliph Moizz addaula (CALIPHATE: C, § 21) was a period of prosperity between the Dailamites, the Turks and the Hamdanid Nasir addaula of Mosul. In the next reign Moizz addaula took Bagdad (945) and was recognized by the caliph Mostakfi as Sultan and amir al-’Omara. It was at this time that the three brothers took the titles Imam, Ruka (Rokn), and Moizz addaula. The authority of the family was absolute, though they paid outward respect to the caliphs. Moizz addaula repelled an attack of the Hamdanids of Mosul. The Buyids, and especially Addaula (Azud-ed-Dowleh, and similar forms), ruled Bagdad wisely and improved the city by great public works such as the great dike, still known as the Bend Amir on the Kur (Cyrus) near Persepolis. They even extended from the Persian Gulf to the Caspian Sea (CALIPHATE: C, § 24).

Ultimately, however, the Buyid dynasty grew weaker under the quarrels of its members and fell an easy prey to the Ghaznevids. In the meantime (999) the Samanids fell before the Ilek-Khans of Turkestam, to the great advantage of the Ghaznevid princes.

For these and other minor dynasties such as the Hasanawyids of Kurdistam (c. 950–1015) and the Kakhawyids of Kurdistam (1007–1051), see Stockvis, Manuel d’histoire, t. 113 sqq. (Leiden, 1888).

The centre of force in Persian politics now changes from west to east. Hitherto the ultimate power, at least nominally, had resided in the caliphate at Bagdad, and all the dynasties which have been noticed derived their authority formally from that source. With the rise of the Ghaznevids and later the Seljucks, the Abbasid caliphate ceased to count as an independent power. As we have seen, the Ghaznevid armies in a brief space destroyed most of the native dynasties of Persia. The first of the house was Alptagin, a Turkish slave of the Samanid Mansur I., who, having quarrelled with his master, took refuge in Afghanistan and founded a semi-independent authority. After his death three unimportant governors of his house held sway, but in 977 the power fell to another former slave, Sabuktargin, who was recognized by the Samanid Nuh II. His son and successor Mahmud (g.?) was attacked by a brother, Isma’il, and retired from Khorsam (of which he had been governor). The Samanids then fell under the power of the Tatar Ilkhans, but Mahmud returned, triumphed over both the Samanids and the Tatars, and assumed the independent title of sultan with authority over Khorsam, Transoxiana and parts of north-west India. Mahmud was a great conqueror, and wherever he went he replaced the existing religion by Mahommedianism. He is described as the patron (if a somewhat ungenerous one) of literature; it was under his auspices that Ferdousi collected the ancient myths of Persia and produced his epic Shahnameh (Book of the Kings). His descendants held a nominal rule till 1187, but in 1152 they lost their extra-Indian territories to the Ghorids, and during the last thirty-five years reigned in diminished splendour at Lahore. Even before this time, however, the supremacy which they enjoyed under Mahmud in Persia had fallen into the hands of the Seljucks who, in the reign of Mas’ud I., son of Mahmud, conquered Khorsam. In 1037 Seljuk princes were recognized in Merv and Nishapur, and in the ensuing eighteen years the Seljucks conquered Balkh, Jorjan, Tabaristan, Khwarizm, Hamadan, Rai, Isfahan, and finally Bagdad (1055). The Abbasid caliphs, who still enjoyed a precarious and shadowy authority at the pleasure of Turkish viziers, gladly surrendered themselves to the protection of the Mahommedian Seljucks, who paid them all outward respect.

Thus for the first time since the Arab conquest of the Sassanian realm Persia was ruled by a single authority, which extended its conquests westward into Asia Minor, where it checked the rulers of Byzantium, and eastward to India and Central Asia. The history of this period is treated at length in articles here required.

The first three Seljuk rulers were Teghurl Beg, Alp Arslan and Malik Shah. On the death of the last the empire was distracted by civil war between his sons Barklyarq, Mahommed and Sinjar, with the result that, although the Seljuks of the direct line maintained nominal supremacy till the death of Sinjar (1157), other branches of the family established themselves in various parts of the empire—Syria, Rum (Asia Minor),
Kermán, and Irak with Kurdistan. Sinjar himself lost all his dominions except Khorasan in wars with the Karakats. The sultans of Kermán were rarely independent in the full sense, but they enjoyed comparative peace and prosperity till the death of Toghru Shah (1170), after which their power fell before the Ghuzz tribes; Kermán was finally captured in 1195 by the Khwarzim shahs. Meanwhile an independent dynasty was formed about 1136 in Azerbaijan by the governors (atabegs) appointed by the Seljuks; this dynasty was overthrown by the Khwarzim shahs in 1225. Similar dynasties existed in Laristan and Fars.

The empire of the Seljuks was essentially military. Their authority over their own officers was so precarious that they preferred to entrust the command to Turkish slaves. These officers, however, were far from loyal to their lords. In every part of the empire they gradually superseded the Seljuk princes, and the minor dynasties above mentioned all owed their existence to the ambition of the Turkish regents or atabegs. The last important dynasty in Persia prior to the Mongol invasion was that of the Salgharids in Fars, founded by the descendants of a Turkish general Salghar, who had formerly been a Turkoman leader and ultimately became chamberlain to Toghru Beg. The first ruler was Sonkor b. Modud, who made himself independent in Fars in 1148. The fourth, Sa'd, became tributary to the Khwarzim shahs in 1195, and the fifth acknowledged allegiance to the Mongol Ogotai and received the title Khakhan. His successors were vassals of the Mongols, and the last, the Princess 'Abish (d. 1287), was the wife of Hulagu's son Mangu Timur.

Before passing on to the Mongol conquerors of Persia it is necessary briefly to notice the shahs of Khwarzim, who have frequently been mentioned as overthrowing the minor dynasties which arose with the decay of the Seljuks. These rulers were descended from Anushatjan, a Turkish slave of Ghazni, who became cupbearer to the Seljuk Malik Shah, and afterwards governor of Khwarzim (Khiva) in 1077. In 1138 the third of the line, Atsiz, revolted but was defeated and expelled by Sinjar. Shortly afterwards he returned, firmly established his power, and extended the Khwarzim Empire as far as Jand on the Sihun. The brief reigns of Il-Arslan and Sultan Shah Mahmud were succeeded by that of Tukush (1172-1190) and Ala ed-din Mahommed (1190-1220). The latter brought practically all Persia under his sway, conquered Bokhara, Samarkand and Otrar, capital of the Karakats, and had even made himself master of Ghazni when his career was stopped by the hordes of the Mongol Jenghiz Khan. In 1231 the Mongols, headed by Jelal ud-din (Jalaludden) Mangburi, or Mango-benti, was banished, and thus the empire of the Khwarzim shahs, which for a brief period had included practically all the lands conquered by the Seljuks, passed away.

Thus from the fall of the Samanids to the invasion of the Mongols five or at most six important dynasties held sway over Persia, while some forty small dynasties enjoyed a measure of local autonomy. During the whole of this period the Abbasid caliphs had been anything but a factor in the government of Persia, except with their capital at Bagdad. But with hardly any exceptions they had been the mere puppets, now in the hands of Turkish ministers, now under the protection of practically independent dynasties. The real rulers of Persia during the years 873-1225 were, as we have seen, the Samanids, the Buyids, the Ghaznevids, the Seljuks, the Salgharids and the Khwarzim shahs. We now come to a new period in Persian history, when the numerous petty dynasties which succeeded the Seljuks were all swallowed up in the great Mongol invasion.

In the later years of the 12th century the Mongols began their westward march and, after the conquest of the ancient kingdom of the Kajakitai, reached the borders of the territory of the Khwarzim shahs, which was at once overwhelmed. Jenghiz Khan died in 1227, and the Mongol Empire stretching from the Caspian to the Yellow Sea was divided up among his sons. Persia itself fell partly in the hands of Jansat and partly into that of the Golden Horde. The actual governor of Persia was Tului or Tule, whose son Hulagu or Hulaku is the first who can be rightly regarded as the sovereign of Persia. His accession occurred in 1256, and henceforward Persia becomes after 600 years of spasmadic government a national unit. Hulagu at once proceeded to destroy a number of nascent dynasties which endeavoured to establish themselves on the ruins of the Khwarzim Empire; about 1255 he destroyed the dynasty of the Assassins by the capture of their stronghold of Alamut (Eagle's Nest), and finally in 1258 captured Bagdad. The thirty-eight and last Abbasid caliph, Mostasim, was brutally murdered, and thus the Mahommedan caliphate ceased to exist even as an emasculated pontificate. The Persian Empire under Hulagu and his descendants extended from the dominions of Jangtai on the north to that of the Egyptian dynasts on the south, and from the Byzantine Empire on the west to the confines of China. Its rulers paid a nominal homage to the Khakhan (Great Khan) in China, and officially recognized this dependence in their title of Ilkhan, i.e. provincial or dependent khan. From 1258 to 1335 the Ilkhans were not seriously challenged. Hulagu fixed his capital at Maragha (Meragha) in Azerbaijan, where he erected an observatory for Nasir ud-din Tusi, who at his request prepared the astronomical tables known as the Zij-i-Hulagu. He died in 1265, and was succeeded by his son Arghun, who married the daughter of Michael Palaeologus, the Byzantine ruler. Argun was a peaceful ruler and endeavoured by wise administration to give order and prosperity to a country torn asunder by a long period of intestine war and the Mongol invasion. He succeeded in repelling two attacks by other Mongolian princes of the house of Jenghiz Khan; otherwise his reign was uneventful. His brother Nukudar (originally Nicolas) Ahmad Khan succeeded him in 1281. This prince was converted to Islam, an event of great moment both to the internal peace and to the external relations of Persia. His persecution of the Christians led them into alliance with the Mongols, who detested Islam; the combined forces were too strong for Nikudar, who was murdered in 1284. The external results were of more importance. The Ilkhans, who had failed in their attempt to wrest Syria from the Mameluke rulers of Egypt, had subsequently endeavoured to effect their object by inducing the European Powers to make a new crusade. The conversion of Nukudar put an end to this policy and Egypt was for some time free from Persian attack (see Egypt: History). The Mongol leaders put on the throne a son of Abagha, by name Arghun. His reign was troubled. His first minister Shams ud-din was suspected of having poisoned Abagha, and was soon put to death. His successor, the amir Bogha, conspiring against Arghun and was executed. Under the third minister (1280-1291), a Jewish doctor named Sa’d addaula (ed-Dowleh), religious troubles arose owing to his persecution of the Mahommedans and his favouring the Christians. The financial administration of Sa’d was prudent and successful, if somewhat severe, and the revenue benefited considerably under his care. But he committed the tactical error of appointing a disproportionate number of Jews and Christians as revenue officials, and thus made many enemies among the Mongol nobles, who had him assassinated in 1291 when Arghun was lying fatally ill. It is possible that it was Sa’d's diplomacy which led Pope Nicholas IV. to send a mission to Arghun with a view to a new crusade. The reign of Arghun was also disturbed by a rebellion of a grandson of Hulagu, Baidu Khan. Arghun died soon after the murder of Sa’d, and was succeeded by his brother Kaikhatu, or Gaykhatu, who was taken prisoner by Baidu Khan and killed (1295). Baidu's reign was cut short in the same year by Arghun's son Ghazan Mahmud, whose reign (1295-1304) was a period of prosperity in war and administration. Ghazan

1It was this prince who destroyed the Ghorid dynasty, which claimed descent from the legendary Persian monarch Zohak. Except for a brief period of submission to the Ghaznevids (1009-1099) they ruled at Ghur until 1215, when they were conquered after a fierce struggle.  

*The dynasty of the Assassins or Isma'ilites was founded in 1190 and extended its rule over much of western Persia and Syria (for the rulers see Stockiv, op. cit. i. 131, and article ASSASSIN).
was a man of great ability. He established a permanent staff to deal with legal, financial and military affairs, put on a firm basis the monetary system and the system of weights and measures, and perfected the mounted postal service. Ghazan fought with success against Egypt (which country had already from 1293 to December 1294 been ruled by a Mongol usurper Kitboga), and even held Damascus for a few months. In 1303, however, his troops were defeated at Merz al-Saffar, and Mongol claims on Syria were definitely abandoned. It was even suggested that the titular Abbasid caliphs who retained an empty title in Cairo under Mameluke protection) should be reinstated at Bagdad, but this proposal was not carried into effect. Ghazan is historically important, however, mainly as the first Mongol ruler who definitely adopted Islam with a large number of his subjects. He died in 1304, traditionally of anger at the Syrian fiasco, and was succeeded by his brother Uljitu (Oezeljitu). The chief events of his reign were a successful expedition against Tatar invaders and the substitution of the new city of Sultanabad as capital for Tabriz, which had been Ghazan's headquarters. Uljitu was a Shi'ite and even stamped his coins with the names of the two Shi'ite imams. He died in 1316, and was succeeded by Abu Sa'id, his son. The prince, under whom a definite peace was made with Malik al-Nasir, the Mameluke ruler of Egypt, had great trouble with powerful viziers and generals which he accentuated by his passion for Baghdad-Khatun, wife of the amir Hosain and daughter of the amir Chupon. This lady he eventually married, with the result that Chupon headed a revolt of his tribe, the Selduz. Abu Sa'id died of fever in 1335, and with him the first Mongol or Ilkhan dynasty of Persia practically came to an end. The real power was divided between Chupon and Hosain the Jelaiir (or Jabir), or the Ilkhanian, and their sons, known respectively as the Little Hasan (Hasan Kuchuk) and the great Hasan (Hasan Buzurg). Two puppet kings, Arpa Khan, a descendant of Hulagu's brother Ankuhna, and Musa Khan, a descendant of Baidu, nominally reigned for a few months each. Then Hasan Kuchup set up one Sati beg, Abu Sa'id's daughter, and wife successively of Chupon, Arfa Khan and one Suleman, the last of whom reigned from 1339 to 1343; in the same time Hasan Buzurg set up successively Abu Mahommed, Tughis Timur and Jahan Timur. A sixth nonentity, Nushin Khan, was a Chupon nominee in 1344, after which time Hasan Buzurg definitely installed himself as the first of the Jelaiird or Ilkhanian-Jelaiirdi dynasty. Practically from the reign of Abu Sa'id Persia was divided under five minor dynasties, (1) the Jelaiirids, (2) the Mozaffarids, (3) the Sarbadarids (Serbedarians), (4) the Beni Kuet and (5) the Jubenians, all of which ultimately fell before the armies of Timur.

1. The Jelaiird rulers were Hasan Buzurg (1336, strictly 1344–1350), Ovais (1356–1374), Hosain (1374–1382), Sultan Ahmad (1382–1410), Shah Walad (1410–1411). Their capital was Bagdad, and their dynasty increased under Hasan. Ovais added Azerbaijan, Tabriz, and even Mosul, and the Black Sheep Turkomans (Kara Kuyuni) of Armenia, with which latter of whom he ultimately entered into alliance. After his death Azerbaijan and Iraq fell to his brother, Sultan Ahmad, who added the eastern brothers Bagdad and Mosul for a few months in part of Kurdistan. It was about this time that Timur (Ghau) began his great career of conquest, under which the Buzurgans and the various Persian dynasties collapsed. By 1393 he had conquered Transoxiana and the Black Sheep Turkomans, Azerbaijan, Bagdad, Mesopotamia, Diarberk and Van, and Ahmad fled to Egypt where he received by Barkuk (Barqu) the Mameluke sultan. Barkuk, who had already accepted the enmity of Timur by slaying one of his own imposed Ahmad's cause, and required him. After Ahmad's return to his normal capital Samarkand, Timur marched and until his death Ahmad ruled only from time to time. In 1406 Ahmad was finally restored, but almost immediately entered upon a second alliance with Timur. The Black Sheep Turkomans (Kara Kuyuni), who defeated and killed him in 1410, and thereafter Shah Walad reigned for a few months only and the throne was occupied by his widow Tundu, formerly wife of Barkuk, who ruled over Basra, Wasit and Shuster till 1416, paying allegiance to Shah Rukh, the second Timurid ruler. Walad's sons Mahomud, Owais and Mahommed, and Hosain, grandson of Sultan Ahmad, successively occupied the throne. The last of these was killed by the Kara Kuyuni, who had established a dynasty in western Persia after Kara Yusuf's victory in 1410.

2. The Mozaffarids, who ruled roughly from 1313 to 1399 in Fars, Kermán and Kurdistan, were descended from the Amir Mohammed, or Muzaffar, who held a post as governor under the Ilkhan Ilaq. Haakim, who followed him in 1313, became governor in Fars under Ahmad Moiz in 1340, and subsequently made himself independent at Fars and Shiraz (1353) and in Isfahan (1356). In 1357 he was defeated by Timur and his son, but escaped again and died in 1364. His descendants, except for the so-called (Jalaluddin) Shah Juha, the patron of the poet Haafiz, were unimportant, and the dynasty was wiped out by Timur about 1392.

3. The Sarbadarids (so-called from their motto Sar-ba-dar, “Head of the Gibbet”), descendants of Abu al-Razzak, who rebelled in Khorasan about 1337, enjoyed some measure of independence under twelve rulers till they also were destroyed by Timur (c. 1380). The Beni Kuet and the Karts, who had governed in Khorasan from 1245, became independent in the early 14th century; they were abolished by Timur (c. 1383).

4. The Jubenians had some power in Azerbaijan from 1337 to 1355, and they were dethroned by the Khiphaks of the house of Judz Khan.

The authority of Timur, which, as we have seen, was dominant throughout Persia from at least as early as 1395 till his death in 1405, was never unchallenged. He passed from one victory to another, but the conquered districts were never really settled under his administration. The fresh risings of the defeated dynasties followed each new enterprise, and he had also to deal with the Mongol hordes whose territory was divided between northern Persia. His descendants were for a brief period the overlords of Persia, but after Shah Rukh (reigned 1409–1446) and Ala ad-daula (1447), the so-called Timurid dynasty, had no authority over Persia. There were Timurid governors of Fars under Shah Rukh, Pir Mahommed (1405–1409), Iskander (1409–1414), Ibrahim (1415–1434) and Abdallah (1434); in other parts of Persia many of the Timurid family held governorships of greater or less importance.

Authorities.—The works relating to Persia will be found under the main dynasties(CALIPHATE; SELJUKS; MONGOLS), and the great rulers (JENGHIZ KHAN; MAHOMED OF GHAZNI; TIMUR). For general information and chronology, see S. Lane Poole, Mohammedan Dynasties (London, 1894); Stockis, Manuel d'histoire, vol. i. (Leiden, 1888); Sir H. Howorth, History of the Mongols (1870–1888).

C.—From the Death of Timur to the Fall of the Safavid Dynasty, 1405–1736.

Timur died in 1405, when in the seventieth year of his age and about to invade China. Besides exercising sovereignty over Transoxiana and those vast regions more or less absorbed in Asiatic Russia of the 14th century, he was also inclusive of the Caucasus, Astrakhan and the lower Volga, and overrunning Mesopotamia, Sogdiana, Asia Minor, Afghanistan and India, he had at this time left his indelible mark upon the chief cities and provinces of Persia. Khorasan and Mazendaran had submitted to him in 1381, Azerbaijan had shortly after followed their example, and Isfahan was seized in 1397. From Isfahan he passed on to Shiraz, and thence returned in triumph to his own capital of Samarkand. Five years later he subdued Mazendaran, and later still he was again at Shiraz, having effected the subjugation of Luristan and other provinces in the west. It may be said that from north to south, or from Astrabad to Hormuz, the whole country had been brought within his dominion.

The third son of Timur, Miran Shah, had ruled over part of Persia in his father's lifetime; but he was said to be insane, and his incapacity for government had caused the loss of Bagdad which he had seized in other provinces. His claim to succession had been put aside by Timur in favour of Pir Mahommed, the son of a deceased son, but Khalil Shah, a son of the discarded prince, won the day. His waste of time and expense upon a fascinating mistress named Shado 'l-Mulk, the "conqueror of the kingdom," soon brought about his deposition, and in 1408 he gave way to Shah Rukh, who, with the exception of Miran Shah, was the only surviving son of Timur. In fact the uncle and nephew changed places—the one quitting his government of Khorasan...
PERSIA
[1405–1736]
to take possession of the Central-Asian throne, the other consenting to become governor of the vacated Persia province and abandon the cares of the empire at Samarkand. In 1409 Khalki Shah died; and the story goes that Shadu 't-Mulk stabbed herself and was buried with her royal lover at Rai, one of the towns which his grandfather had partly destroyed.

Shah Rukh, the fourth son of Timur, reigned for thirty-eight years, and appears to have been a brave, generous, and enlightened monarch. He removed his capital from Samarkand to Herat, of which place he rebuilt the citadel, restoring and improving the town. Merv also profited from his attention to its material interests. Sir John Malcolm speaks of the splendour of his court and of his encouragement of science and learning. He sent an embassy to China; and an English version of the travels to India of one of his emisaries, Abd ur-Razzak, is to be found in R. H. Major's *India in the Fifteenth Century* (London, Hakluyt Society, 1857). As regards his Persian possessions, he had some trouble in the north-west, where the Turkmans of Asia Minor, known as the Kara Kuyun, 1 or "Black Sheep," led by Kara Yusuf 2 and his sons Iskandar and Jahan Shah, had advanced upon Tabriz, the capital of Azerbaijan. On the death of the Shah Rukh in 1446 he was succeeded by his son Ulugh Bey, whose career is told in detail by the numerous tales bearing his name, quoted by European writers when determining the latitude of places in Persia. He was, moreover, himself a poet and patron of literature, and built a college as well as an observatory at Samarkand. There is no evidence to show that he did much to consolidate his grandfather's conquests south of the Caspian. Ulugh Bey was put to death by his son Abd ul-Latif, who, six months later, was slain by his own soldiers. Babar—not the illustrious founder of the Mughal dynasty in India, but an elder member of the same house—next obtained possession of the sovereign power, and established himself in the government of Khorasan and the neighbouring countries. He died after a short rule, from habitual intemperance. After him Abu Sa'id, grandson of Miran Shah, and once governor of Fars, became a candidate for empire, and allied himself with the Uzbek Tatars, seized Bokhara, entered Khorasan, and waged war upon the Turkmans tribe aforesaid, which, since the invasion of Azerbaijan, had, under Jahan Shah, overrun Irak, Fars and Kermán, and pillaged Herat. But he was eventually taken prisoner by Usun Hasan, and killed.

It is difficult to assign dates to a few events recorded in Persian history for the eighteen years following the death of Abd ul-Latif; and, were it not for chance European missions, the same difficulty would be felt in dealing with the period after the death of Abu Sa'id up to the accession of Isma'il Sufi in 1499. Sultan Ahmad, eldest son of Abu Sa'id, reigned in Bokhara; his brother, Omar Sheikh, in Ferghana; but the son of the latter, the great Babar, was driven by the Uzbeks to Kabul and India. More to the purpose is it that Sultan Hosain Mirza, great-grandson of Omar Sheikh, son of Timur, reigned in Herat from 1487 to 1506. He was a patron of learned men, among others of the historians Mirkhond and Khwadamir, and the poets Jami and Hafid. But at no time could his control have extended over central and western Persia. The nearest approach to a sovereignty in those parts on the death of Abu Sa'id is that of Usun Hasan, the leader of the Ak Kuyun, or "White Sheep," Turkmans, and conqueror of the "Black Sheep," whose chief, Jahan Shah, he defeated and slew. Between the two tribes there had long been a feud. Both were composed of settlers in Asia Minor, the "Black Sheep" having consolidated their power at Van, the "White" at Diarbekr.

Sir John Malcolm states that at the death of Abu Sa'id, Sultan Hosain Mirza "made himself master of the empire," 4

and, a little later, that "Usun Hasan, after he had made himself master of Persia, turned his arms in the direction of Turkey," 5 but the reader is left to infer for himself what the real "empire" of Hosain Mirza, and what the limit of the "Persia" of Usun Hasan. The second could not well be included in the first, because the Turkmans were in possession of the greater part of the Persian plateau, while the "sultan" was in Herat, to which Khorsan belonged. It may be assumed that an empire like that acquired by Timur could not long be maintained by his descendants in its integrity.

The Turkish adjective *usun,* "long," applied to Hasan, the Turkmanc monarch of Persia (called also by the Arabs *Hasanu* 't-Tawil), is precisely the qualifying Persian word *zar* used in the compound designation of Artaxerxes Longimanus; and Malcolm quotes the statement of a Venetian envoy in evidence that Usun Hasan was "a tall thin man, of a very open and engaging countenance." This reference, and a further notice in Markham's history, supply the clue to a store of valuable information made available by the publications of the Hakluyt Society. The narratives of Caterino Zeno, Barbaro and Contarini, envoy's from Venice to the court of Usun Hasan, are in this respect especially interesting. Zeno was sent in 1475, and stated his warlike rules against the Ottoman sultan, and was succeeded in his dominions. The result was disastrous to the shah is not surprising, but the war seems to hold a comparatively unimportant place in the annals of Turkey.

Usun Hasan had married Despina (Gr. Δεσποινα), daughter of the emperor of Trebizond, Calo Johannes of the house of the Comneni; and Zeno's wife was niece to this Christian princess. The relationship naturally strengthened the envoy's position at the court, and he was permitted to visit the queen in the name of the republic which he represented. Barbaro and Contarini met at Isfahan in 1474, and there paid their respects to the shah together. Kamur and Tauris or Tabriz (then the capital) were also visited by the Italian envoy's, following in the royal suite; and the incidental notice of these cities, added to Contarini's formal statement that "the extensive country of Ussan-cassan [sic] is bounded by the Ottoman Empire and by Carmania," and that Siras (Shiraz) is comprehended in it, proves that at least Azerbaijan, Irak, and the main part of the provinces to the south, inclusive of Fars, were within the dominions of the reigning monarch.

1479 is good, if somewhat uncertain, to suppose that Jahan Shah, the Black Sheep Turkmanc, before his defeat by Usun Hasan, had set up the standard of royalty; and Zeno, at the outset of his travels, calls him "king of Persia" 6 in 1450. Chardin alludes to him in the same sense; but Hasan the Long is a far more prominent figure, and has hardly received justice at the hands of the historian. Indeed, his identity seems to have been lost in the various modes of spelling his name adopted by the older chroniclers, who call him indiscriminately 5 Aymbeuleus, Asembeius, Asembe, Assimeo, or Ussan Cassano. He is said to have earned the character of a wise and valiant monarch, to have reigned eleven years, to have lived to the age of seventy, and, on his death in 1477 or (according to Kruinski and Zeno) 1478, to have been succeeded on the throne of Persia by his son Ya'qub. This prince, who had slain an elder brother, died by poison (1485), after a reign of seven years. The dose was offered to him by his wife, who had been unfaithful to him and sought to set her paramour on his throne.

Writers differ as to the succession to Ya'qub. Zeno's account is that a son named Alamur (called also, Alamut, Alvante, Albant, and Alwung Bey) was the next king, who, besides Persia, possessed Diarbekr and part of greater Armenia near the Euphrates. On the other hand, Kruinski states that, Ya'qub dying childless, his relative Julaver, one of the grandees of the kingdom, seized the throne, and held possession of it for three years. Basingar, it is added, succeeded him in 1488 and reigned till 1490, when a young nobleman named Rustan (Rustam?) obtained the sovereign power and exercised it for seven years. This account is confirmed by

1 See also Ramusio's preface. 4 Knolles, Purchas, Zeno.
Angioletto, a traveller who followed his countrymen Barbara and Contarini to Persia; and from the two authorities combined, may be gathered the further narration of the murder of Rustam, and usurpation of the throne by a certain Ahmad, whose death, under torture, six months afterwards, made way for Alamut, the young son of Hassan. These discrepancies can be reconciled on reference to yet another record bound up with the narratives of the four Italians aforesaid, and of much the same period. In the Travels of a Merchant in Persia the story of Ya'qub's death is supplemented by the statement that 'the great lords, hearing of their king's decease, had quarrels among themselves, so that for five or six years all Persia was in a state of civil war, first one and then another of the nobles becoming sultans. At last a youth named Alamut, aged fourteen years, was raised to the throne, which he held till the succession of Sheikh Isma'il.' Who this young man was is not specified; but other writers call Alamut and his brother Murad the sons of Ya'qub, as though the relationship was unquestionable.

Now little is known, save incidentally, of Julaver or Rustam: but Baisinger is the name of a nephew of Omar Sheik, king of Elmina, and contemporary of Uzun Hasan. There was no doubt much anomaly and confusion in the interval between the death of Ya'qub and the restoration, for two years, of the dynasty of the White Sheep. But the tender age of Alamut would, even in civilized countries, have necessitated a regency; and it may be assumed that he was the next legitimate and more generally recognized sovereign. Markham, in designating this prince the last of his house, states that he was dethroned by the renowned founder of the Safavi dynasty. This event brings us to one of the most interesting periods of Persian history, any account of which must be defective without a prefatory sketch of Isma'il's Sufi.

The Sufi or Safavid (Safawi) Dynasty (1499–1736).—Sheikh Saifu'd-Din Izhak, \(^1\)—lineally descended from Musa, the seventh imam—was a resident at Ardebil (Arasibil) south-west of the Caspian, some time during the 14th century. It is said that his reputation for sanctity so charmed the attention of Timur, who sought him out in his abode, and was so charmed by the visit that he released, at the holy man's request, a number of captives of Turkish origin, or Georgians, taken in the wars of Bayezid. The act ensured to the Sheikh the constant devotion and gratitude of these men—a feeling which was loyally maintained by their descendants for the members of his family in successive generations.

His son Sadru'd-Din and grandson Kwaja 'Ali (who visited Mecca and died at Jerusalem) retained the high reputation of their pious predecessor. Junaid, a grandson of the last, married a sister of Uzun Hasan, and by her had a son named Sheikh Haidar, who married his cousin Martha, daughter of Uzun Hasan and Queen Despina. Three sons were the issue of this marriage, Sultan 'Ali, Ibrahim Mirza, and the youngest, Isma'il, the date of whose birth is put down as 1480 for reasons which will appear hereafter. So great was the influence of Sheikh Haidar, and so earnestly did he carry out the principles of conduct which had characterized his family for five generations, that his name has become, as it were, inseparable from the dynasty of his son Isma'il; and the term ‘Haidar’ (leoni) is applied by many persons to indicate generally the Safawids of Persia. The outcome of his teaching was a division of Mahomedanism vitally momentous to the world of Islam. The Persian mind was peculiarly adapted to receive the form of religion prepared for it by the philosophers of Ardebil. The doctrines presented were dreamy and mystic; they rejected the infallibility of human wisdom, and threw suspicion on the order and arrangement of human orthodoxy. There was free scope given for the indulgence of that political imagination which revels in revolution and chafes at prescriptive bondage. As Malcolm remarks, ‘the very essence of Sufi-ism is poetry.’

Those authorities who maintain that Ya'qub Shah left no son to succeed him consider valid the claim to the vacant throne of Sheikh Haidar Sufi. Purchas says that Ya'qub himself, ‘jealous of the multitude of Aidar’s disciples and the greatness of his fame, caused him to be secretly murdered’; but Krusinski attributes the act to Rustam a few years later. Zeno, the anonymous merchant and Angioletto affirm that the devotee was defeated and killed in battle—the first making his conqueror to be Alamut, the second a general of Alamut’s, and the third an officer sent by Rustam named Suleiman Bey. Malcolm, following the Zubdatu 't-tawarih, relates that Sheikh Haidar was vanquished and slain by the governor of Shirvan. The subsequent statement that his son, Sultan 'Ali, was seized, in company with two younger brothers, by Ya'qub, ‘one of the descendants of their grandfather Uzun Hasan, who, jealous of the numerous disciples that resorted to Ardebil, confined them to the hill fort of Istakh in Fars,’ seems to indicate a second interpretation of the passage just extracted from Purchas, and that there is confusion of persons and incident somewhere. One of the sons here alluded to was Isma'il, whom Malcolm makes to have been only seven years of age when he fled to Gilan in 1492. Zeno states that he was then thirteen, which is much more probable, and the several data available for reference are in favour of this supposition.

The life of the young Sufi from this period to his assumption of royalty in 1499 was full of stirring adventure; and his career as Isma'il I. was a brilliant one. According to Zeno, who seems to have carefully recorded the events of the time, he left his temporary home on an island of Lake Van before he was eighteen, and, passing into Karabakh, between the Aras and Kur, turned in a south-easterly direction into Gilan. Here he was enabled, through the assistance of a friend of his father, to raise a small force with which to take possession of Baku on the Caspian, and thence to march upon Shemakha in Shirvan, a town abandoned to him without a struggle. Hearing, however, that Alamut was advancing to meet him, he was compelled to seek new levies from among the Jengish Christians and others. At the head of 20,000 men, he thoroughly routed his opponents, and, having cleared the way before him, marched straight upon Tabriz, which at once surrendered. He was soon after proclaimed shah of Persia (1499), under the designation which marked the family school of thought.

Alamut had taken refuge at Diarbek; but his brother Murad, at the head of an army strengthened by Turkish auxiliaries, was still in the field with the object of contesting the paternal crown. Isma'il lost no time in moving against him, and won a new victory on the plains of Tabriz. Murad fled with a small remnant of his soldiers to Diarbek, the rallying-point of the White Sheep Turkomans. Zeno states that in the following year Isma'il entered upon a new campaign in Kurdish and Asia Minor, but that he returned to Tabriz without accomplishing his object, having been harassed by the tactics of Ala ud-Daula, a beleyeror, or governor in Armenia and parts of Syria. Another writer says that he marched against Murad Khan in Irak-i-Alami and Shiraz. This last account is extremely probable, and would show that the young Turkoman had wished to make one grand effort to save Isfahan and Shiraz (with Kazvin and the neighbouring country), these being, after the capital Tabriz, the most important cities of Uzun Hasan’s Persia. His men, however, apparently dismayed at the growing prestige of the enemy, did not support him, and he was defeated and probably slain. There is similar evidence of the death of Alamut, who, it is alleged, was treacherously handed over to be killed by the shah’s own hands.

Isma'il returned again to Tabriz (1501) ‘and caused great rejoicings to be made on account of his victory.’ In 1503 he had added to his conquests Bagdad, Mosul and Jezira on the Tigris. The next year he was called to the province of

---

1 According to Langh, the annotator of Chardin, his real designation was Abu 'l-Fath Izhak, the Sheikh Saifu 'l-Hakk wu 'd-Din or "pure one of truth and religion."
Gilan to chaste a refractory ruler. Having accomplished his end, he came back to his capital and remained there in comparative quiet till 1507.\(^1\) Malcolm's dates are somewhat at variance with the above, for he infers that Bagdad was subdued in that particular year; but the facts remain. All writers seem to agree that in 1508 the king's attention was drawn to an invasion of Khorasan by Shaibani, or Shahi Beg, the Uzbek, a descendant of Jenghiz and the most formidable opponent of Babar, from whom he had, seven years before, wrested the city of Samarkand, and whom he had driven from Turkestan to Kabul. Since these exploits he had obtained great successes in Tashkent, Ferghana, Hissar, Kunduz, and Khwarizm (Kharezm), and, at the time referred to, had left Samarkand intact upon mischief south and west of the Oxus, had passed the Murghab, and had reached Sarakhs (Serrakhs). Isma'\(i\)\(^{\text{ii}}\)\(^\text{ii}\) encamped on this occasion at Isfahan, and there concentrated the bulk of his army—strengthening his northern (and probably north-eastern) frontier with large bodies of cavalry, but maintaining an attitude of simple watchfulness. In 1510, when Shaibani had invaded Khorasan the second time, and had ravaged the Persian provinces between Kermia and Shaibani's army, and--if this be true, referring to the land encroached on as "hereditary,"--Shaibani replied that he did not understand on what was founded the claim "to inherit." Eventually the Persian troops were put in movement, and the Uzbegs, having been divided into small detachments scattered over the country, fell back and retreated to Herat. Their leader repaired to Merv, but Isma'\(i\)\(^{\text{ii}}\)\(^\text{ii}\) quickly followed him and enticed him out to battle by taunt and reproach. Shaibani was defeated and fled, but was overtaken in his flight, and put to the sword, together with numerous relatives and companions.

The next remarkable event in Isma'\(i\)'s reign is his war with Sultan Selim I. Its origin may be traced to the Ottoman emperor's hatred and persecution of all heretical Moslems in his dominions, and the shah's anger at the fanaticism which had urged him to the slaughter of 40,000 Turks suspected to have thrown off the orthodox Sunnite doctrines. The sultan's army advanced into Azerbaijan and western Persia through Tokat and Erzinger. Isma'\(i\) had at this time the greater number of his soldiers employed in the newly-conquered province of Khorasan and was driven to raise new levies in Kurdistan to obtain a sufficient force to resist the invasion. It is asserted by some that his frontier then extended westward to Sivas, a city situated in a large high plain watered by the Kizil Irmak, and that hence to Khoi, 90 m. west of Tabriz, he followed the approved and often successful tactics of ravaging and retreating, so as to deprive his advancing enemy of supplies. There is good evidence to show that the Turkish janissaries were within an ace of open revolt, and that but for extraordinary firmness in dealing with them they would have abandoned their leader in his intended march upon Tabriz. In fine, at or near Khoi, the frontier-town of Azerbaijan, the battle (1514) was fought between the two rival monarchs, ending in the defeat of the Persians and the triumphant entry of Selim into their capital.

There are stirring accounts of that action and of the gallant deeds performed by Selim and Isma'\(i\), both personally engaged in it, as well as of the general rage with which his enemies were not present at all.\(^2\) It is tolerably certain that the Turks won the day by better organization, superiority of numbers, and more especially the use of artillery. On the side of the Persians the force consisted of little more than cavalry.

Selim remained at Tabriz no more than eight days. Levying a contribution at that city of a large number of its skilled artisans whom he sent off to Constantinople, he marched thence towards Karabagh with intent to fix his winter quarters in those parts and newly invade Persia in the spring, but the insubordination of his troops rendered necessary his speedy return to Turkey. His expedition, if not very glorious, had not been unproductive of visible fruits. Besides humbling the power of an arrogant enemy, he had conquered and annexed to his dominions the provinces of Diarbekr and Kurdistan.\(^4\)

From 1514 to 1524, although the hostile feeling between the two countries was very strong, there was no serious nor open warfare. Selim's attention was diverted from Persia to Egypt; Isma'\(i\)'s advantage of the sultan's death in 1519 to overrun and subdue unfortunate Georgia, as Jahan Shah of the "Black Sheep" had done before him; but Suleiman, who succeeded Selim, was too strong to admit of retaliatory invasion being carried out with impunity at the cost of Turkey.

In 1524 Isma'\(i\) died\(^5\) at Ardebil when on a pilgrimage to the tomb of his father. The Persians dwell with rapture on his character, writes Sir John Malcolm, for they deem him "the most extraordinary, but not the least extraordinary of Isma'\(i\)'s Character, Shah Tahmasp."

It was about this time that Persia again entered into direct relations with one of the states of western Europe. In 1510 and 1514 Alphonso d'Albuquerque, the governor of Portuguese India, sent envoys to Isma'\(i\), seeking an alliance. In 1515, after occupying Hormuz, he despatched a third embassy under Fernao Gomes de Almeida. His object was to utilize the Shi'ite armies in conjunction with the Portuguese fleet for an attack upon the Sunnite powers— Egypt and Turkey—which were then at war with Portugal in the East; See, for further details and authorities, K. G. Jayne, Vasco da Gama and his Successors, pp. 106–110 and App. A. (London, 1910).--Ed.

\(^1\) Malcolm says 1523, Krusinski 1525; Angiello heard of his death at Cairo in 1523. Krusinski adds that he was forty-five years of age.

\(^2\) Angiello says he "Shaithemes." As an instance of the absurd alternating current in France as in England the word "ach-tacon" may be mentioned. It is explained in Chardin's terms as "the taste of the turkish...." "Ach tacon" is the first syllable of "taco con," which was understood in its common acceptance for "food," or "victuals," but "taco" was naturally a puzzler. The solution of the whole difficulty is, however, to be found in the Turco-Persian "khasht khanah," pronounced by Turks Jasta khan, or more vulgarly asta khan and even to a French ear ash-tacon, a hospital, literally a sick-house. This word is undoubtedly current at Tabriz and throughout northern Persia.

\(^3\) The other brothers were Ikhsan, Bahram and Mirza, each having had his particular appanage assigned him.
and the actual seizure of Herat, necessitating the recovery of that city and a march to Kandahar (1536); the temporary loss of Kandahar in the following year (1537), when the governor ceded it to Prince Camran, son of Babar; the hospital reception accorded to the Indian emperor Humayun (1543); the rebellion of the shah's brother next in age, Ilkhas, who, by his alliance with the sultan, brought on a war with Turkey (1548); and finally a fresh expedition to Georgia, followed by a revengeful incursion which resulted in the enforced bondage of thousands of the inhabitants (1552).

Bayezid, a son of the Turkish emperor, rebelled, and his army was beaten in 1559 by the imperial troops at Konia in Asia Minor. He fled to Persia and took refuge with Shah Tahmasp, who pledged himself to give him a permanent asylum. Suleiman's demand, however, for extradition or execution was too peremptory for refusal, and the prince was delivered up to the messengers sent to take him. Whatever the motive, the act itself was highly appreciated by Suleiman, and became the means of cementing a recently concluded peace between the two monarchs. Perhaps the domestic afflication of the emperor and the anarchy which in his later years had spread in his dominions had, however, more to do with the maintenance of tranquillity than any mere personal feeling. At this time not only was there religious fanaticism at work to stir up the mutual hatred ever existing between Sunni and Shi'a, but the intrigue of European courts was probably directed towards the maintenance of an hostility which deterred the sultan from aggressive operations north and west of Constantinople. "Tis only the Persian stands between us and ruin" is the reported saying of Busbecq, ambassador at Suleiman's court on the part of Ferdinand of Austria; "the Turk would fain be upon us, but he keeps him back."

In 1561 Anthony Jenkinson arrived in Persia with a letter from Queen Elizabeth to the shah. He was to treat with his majesty of "Traific and Commerce for our English Merchants." His reception was not encouraged, and led to no result of importance.

Tahmasp died in 1576, after a reign of about fifty-two years. He must have been some sixty-six years of age, having come to the throne at fourteen. Writers describe him as a robust man, of middle stature, wide-lipped, and of tawny complexion. He was not wanting in soldierly qualities; but his virtues were rather negative than decided. The deceased shah had a numerous progeny, and on his death his fifth son, Haidar Mirza, proclaimed himself king, supported in his pretensions by the Kizil-bash-bash of Ustujulu. Another tribe, the Afshar, insisted on the succession of the fourth son, Isma'il. Had it not been that there were two candidates in the field, the contention would have resembled that which arose shortly after Tahmasp's accession. Finally Isma'il, profiting from his brother's weak character and the intrigues set on foot against him, obtained his object, and was both by his own pretension to the crown.

The reign of Isma'il II. lasted less than two years. He was found dead in the house of a confectioner in Kazvin, having left the world either drunk, drugged or poisoned. Isma'il II.

No steps were taken to verify the circumstances, for the event itself was a cause of general relief and joy. He was succeeded by his eldest brother, Mahommed Mirza, otherwise called Mahommed Khudaband, who claimed to sovereignty had been originally put aside on the ground of physical infirmity. He had the good sense to trust his state affairs almost wholly to an able minister; but he was cowardly enough to deliver up that minister into the hands of his enemies. His kingdom was distracted by intestine divisions and rebellion, and the foe appeared also from without. On the east his youngest son, 'Abbas, held possession of Khorasan; on the west the sultan's troops again entered Azerbaijan and took Tabriz. His eldest son, Hamza Mirza, upheld his fortunes to the utmost of his power, reduced the rebel chieftains, and forced the Turks to make peace and retire; but he was stabbed to death by an assassin. On the news of his death reaching Khorasan, Murshid Kuli Khan, leader of the Ustujulu Kizil-bash, who had made good in fight his claims to the guardianship of 'Abbas, at once conducted the young prince from that province to Kazvin, and occupied the royal city. The object was evident, and in accordance with the popular feeling. 'Abbas, who had been proclaimed king by the nobles at Nishapur some two or three years before this occurrence, may be said to have now undertaken in earnest the cares of sovereignty. His ill-starred father, at no time more than a nominal ruler, was at Shiraz, apparently deserted by soldiers and people. Malcolm infers that he died a natural death, but when or where is not stated.

Shah 'Abbas the Great commenced his long and glorious reign (1586) by retracing his steps towards Khorasan, which had been reinvaded by the Uzbegs almost immediately after his departure thence with the Kizil-bash chief. They had besieged and taken Herat, killed the governor, plundered the town, and laid waste the surrounding country. 'Abbas advanced to Meshed, but owing to internal troubles he was compelled to return to Kazvin without going farther east. In his absence 'Abd-ul-Munim Khan, the Uzbeg commander, attacked the sacred city, obtained possession of it while the shah lay helplessly ill at Teheran, and allowed his savage soldiers full licence to kill and plunder. The whole kingdom was perplexed, and 'Abbas had much work to restore confidence and tranquillity. But circumstances rendered impossible his immediate renewal of the Khorasan warfare. He was summoned to Shiraz to put down rebellion in Fars; and before he could drive out the Uzbegs, he had to secure himself against Turkish audacity from the west. He had been engaged in a war with Murad III, in Georgia. Peace was concluded between the two sovereigns in 1590; but the terms were unfavourable to Persia, who lost thereby Tabriz and one or more of the Caspian ports. A stipulation was included in the treaty to the effect that Persians were not to curse any longer the first three caliphs, -a sort of privilege previously enjoyed by Shi'ites as part and parcel of their religious faith.

In 1597 'Abbas renewed operations against the Uzbegs, and succeeded in recovering from them Herat and Khorasan. Eastward he extended his dominions to Balkh, and in the south his generals made the conquest of Bahrain (Bahrein), on the Arabian side of the Persian Gulf, and the territory and islands of the Persian seaboard, inclusive of the mountainous province of Lar. He strengthened his position in Khorasan by planting colonies of Kurdish horsemen on the frontier, or along what is called the "atak" or skirt of the Turkoman mountains north of Fars. In 1601 the war with the Ottoman Empire, which had been partially renewed prior to the death of Sultan Murad in 1595, with little success on the Turkish side, was now entered upon by 'Abbas with more vigour. Taking advantage of the weakness of his ancient enemy in the days of the poor voluntaery Mahommed III., he began rapidly to recover the provinces which Persia had lost in preceding reigns, and continued to reap his advantages in succeeding campaigns under Ahmed I., until under Othman II. a peace was signed restoring to Persia the boundaries which she had obtained under the first Isma'il. On the other side Kandahar, which Tahmasp's lieutenant had yielded to the Great Mogul, was recovered from that potentate in 1609.

At the age of seventy, after a reign of forty-two years, 'Abbas died at his favourite palace of Farahabad, on the coast of Mazandaran, on the night of the 27th of January 1628. Perhaps the most distinguished of all Persian kings, his fame was not merely local but world-wide. At his court were ambassadors from England, Russia, Spain, Portugal, Holland and India.

---

1 Creasy says that "Suleiman led his armies against the Persians in several campaigns (1533, 1534, 1535, 1548, 1553, 1554), during which the Turks often suffered severely through the difficult nature of the countries traversed, as well as through the bravery and activity of the enemy." All the years given were in the reign of Tahmasp I.
2 Krusiniski says in 1585.
To his Christian subjects he was a kind and tolerant ruler. The establishment of internal tranquillity, the expulsion of interlopers and marauders like Turks and Uzbegs, the introduction of salutary laws and the promotion of public works of utility—these alone would render remarkable his two-score years of enlightened government. With a fine face, “of which the most remarkable features were a high nose and a keen and piercing eye,” he is said to have been below the middle height, robust, active, a sportsman, and capable of much endurance. It is, however, to be regretted that this monarch’s memory is tarnished by more than one dark deed. The murder of his eldest son, Šufi Mirza, and the cruel treatment of the two younger brothers, were stains which could not be obliterated by an after-repentance. All that can be now said or done in the matter is to repeat the testimony of historians that his grief for the loss of Šufi Mirza was profound, and that, on his death-bed, he nominated that prince’s son (his own grandson) his successor.

Sam Mirza was seventeen years of age when the nobles, in fulfilment of the charge committed to them, proclaimed him king under the title of Shah Šufi. He reigned for fourteen years, and his reign was a succession of barbarities, which were attributed to an evil disposition and acted upon by an education void of all civilizing influences. When left to his own devices he became a drunkard and a murderer, and is accused of the death of his mother, sister and favourite queen. Among many other sufferers Imam Kuli Khan, conqueror of Lar and Hormuz, the son of one of Abbas’s most famous generals, founder of a college at Shiraz, and otherwise a public benefactor, fell a victim to his savage cruelty. During his reign the Uzbegs were driven back from Khorasan, and a rebellion was suppressed in Gilan; but Kandahar was again handed over to the Moguls of Delhi, and Bagdad retaken from Persia by Sultan Murad—both serious national losses. Tavernier, without charging the shah with injustice to Christians, mentions the circumstance that “the first and only European ever publicly executed in Persia was in his reign.” He was a watchmaker named Rodolph Stadler, who had slain a Persian on suspicion of intrigue with his wife. Offered his life if he became a Moslem, he resolutely declined the proposal, and was decapitated, this act of cruelty, if it was not condoned at Isfahan by the words “Cygit Rodolphe” on a long wide shah. Shah Šufi died (1641) at Kashan and was buried at Kun.

His son, Abbas II., succeeded him. Beyond regaining Kandahar, an operation which he is said to have directed in person, there is not much to mark his life to the outer world. As to foreign relations, he received embassies from Europe and a deputation from the French East India Company; he sought to conciliate the Uzbegs by treating their refugee chiefs with unusual honour and sumptuous hospitality; he kept on good terms with Turkey; he forgave the hostility of a Georgian prince when brought to him a captive; and he was tolerant to all religions—always regarding Christians with especial favour. But he was a drunkard and a debauchee, and chroniclers are divided in opinion as to whether he died from the effects of drink or licentious living. That he changed the system of blinding his relatives from passing a hot metal over the open eye to an extraction of the whole pupil is indicative of gross brutality. Abbas II. died (1668) at the age of thirty-eight, after a reign of twenty-seven years, and was buried at Kun in the same mosque as his father.

‘Abbas was succeeded by his son, Shah Šufi II., crowned a second time under the name of Shah Suleiman. Though weak, dissolve and cruel, Suleiman is not without his panegyrists. Chardin, whose testimony is all the more valuable from the fact that he was contemporary with him, relates many stories characteristic of his temper and habits. He kept up a court at Isfahan which surprised and delighted his foreign visitors, among whom were ambassadors from European states; and one learned writer, Kaempfer, credits him with wisdom and good policy. During his reign Khorasan was invaded by the ever-encroaching Uzbegs; the Kipchak Tatars plundered the shores of the Caspian, and the island of Kishm was taken by the Dutch; but the kingdom suffered otherwise no material loss. He died in 1694, in the forty-ninth year of his age and twenty-sixth of his reign.

About a year before his death, he is described by Bunsen, a missionary from the French king Louis XIV., as tall, strong and active, “a fine prince—a little too effeminate for a monarch,” with “a Roman nose very well proportioned to other parts,” “very large blue eyes,” and “a mildest manner, a bearded black, shav’d round, and well turn’d, even to his ears.” The same writer greatly praises him for his kindness to Christian missionaries.

Krusinski’s memoir is full of particulars regarding Shah Hosain, the successor of Suleiman. He had an elder and a younger brother, sons of the same mother; but the eldest had been put to death by his father’s orders, and the youngest secreted by maternal precaution lest a similar fate should overtake him. There was, however, a second candidate for power in the person of a half-brother, ‘Abbas. His father was the warlike Hormuz, the wealthier prince was the worthier of the throne, but the latter better suited the policy of the eunuchs and those noblemen who had the right of election. Indeed Suleiman himself is reported to have told the grandees around him, in his last days, that “if they were for a martial king that would always keep his foot in the stirrup they ought to choose Mirza ‘Abbas; but that if they wished for a peaceable reign and a pacific king they ought to fix their eyes upon Hosain.” But he himself made no definite choice.

Hosain was selected, as might have been anticipated. On his accession (1694) he displayed an attachment to religious observances by prohibiting the use of wine—causing all wine-vessels to be brought out of the royal cellars and destroyed, and forbidding the Armenians to sell any more of their stock in Isfahan. The shah’s grandmother, by feigning herself sick and dependent upon wine only for cure, obtained reversal of the edict. For the following account of Shah Hosain and his successors to the accession of Nadir Shah, Sir Clements Markham’s account has been mainly utilized.

The new king soon fell under the influence of mullahs, and was led so far to forget his own origin as to persecute the Sufis. Though charitable, he was weak and licentious; and once out of the hands of the fanatical party he became ensnarled by women and intrigues, while the influence of the Sufis, who claimed to have peace for all the world, prevailed throughout the empire, but it was the precursor of a terrible storm destined to destroy the Safavid dynasty and scatter calamity broadcast over Persia. In the mountainous districts of Kandahar and Kabul the hardy tribes of Afghans had for centuries lived at war; the Uzbegs desolated Khorasan, and they were divided into two great branches—the Ghilzais of Ghazine and Kabul and the Sudazais of Kandahar and Herat. In 1702 a newly-appointed governor, one Shah Nawaz, called Gurji Khan from having been a watchman—ruler of Georgia, arrived at Kandahar with a tolerably large force. He was a clever and energetic man, and had been instructed to take severe measures with the Afghans, some of whom were suspected of intriguing to restore to the city to the Delhi emperor. At Kandahar he found that, contrary to the government, sley Gurji Khan and his retinue, seized the city, defeated two Persian armies sent against him, and died a natural death in 1715. His brother, Mir ‘Abdallah, succeeded him in the government of the Afghan, but after a few months, Mahmud, a son of Mir Wa’iz, a very young man, murdered his uncle and assumed the title of a sovereign prince.

In the meanwhile the Sadzadal tribe revolted at Herat, and declared itself independent in 1717; the Kurds overran the narraty round Hormuz; the Uzbegs desolated Khorasan; and the Arabs of Muscat seized the island of Bahrein and threatened banders Abbas. Thus surrounded by dangers on all sides the wretched shah was bewildered. He made one vain attempt to regain his possessions in the Persian
Gulf; but the Portuguese fleet which had promised to transport his troops to Bahrain was defeated by the imam of Muscat and forced to retreat to Goa.

The court of Isfahan had no sooner received tidings of this disaster than a large army of Afghans invaded Persia in the year 1721, seized Kerman, and in the following year advanced to within four days' march of the city of Isfahan. The shah offered him a sum of money to induce him to withdraw, but he was put to flight, routing to a place called Gulnabad, within 9 m. of the capital. The ill-disciplined Persian army, hastily collected, advanced to attack the rebels. Its centre was led by Sheikh 'Ali Khan, covered by twenty-four field-pieces. The wall of the city had been strengthened, and the ramparts were high. The whole force amounted to 50,000 men, while the Afghans could not count half that number.

On the 8th of March 1722 the richly dressed hosts of Persia appeared before the walls of Isfahan, which were scooped and disfigured by their long marches. The wall of Arabia commenced the battle by attacking the left wing of the army with great fury, routing it, and plundering their camp. The prime minister immediately led the General Guards against the enemy's right wing, but was routed, and the Afghans, taking advantage of the confusion, captured the Persian guns and turned them on the Persian centre, who fled in confusion without striking a blow. The wall of Arabia escaped into Isfahan, and Mahmud the Afghan gained a complete victory. Fifteen thousand Persians remained dead on the field. A panic now seized on the surrounding inhabitants, and thousands of country people fled into the city. Isfahan was then one of the most magnificent capitals of the world. Mahmud seized on the Armenian suburb of Jufa, and invested the doomed city; but Tahmasp, son of the shah, had previously escaped into the mountains of Mazandaran. Famine soon began to press upon the besieged, and Nader, the son of the late Shah Haji 

Having been conducted to the Afghan camp, he fixed the royal plume of feathers on the young rebel's turban with his own hand; and 4000 Afghans were ordered to occupy the palace and gates of the city. When Mahmud entered Isfahan, finding the shah on his left hand, and, setting himself on the throne in the royal palace, he was saluted as sovereign of Persia by the unfortunate Hossain. When Tahmasp, the fugitive prince, received tidings of the abdication of his father, he fled to the city of Kandahar.

Turkey and Russia were not slow to take advantage of the calamities of Persia. The Turks seized on Tiflis, Tabriz, and Hamadan, while Peter the Great, whose aid had been sought by the friendless Tahmasp, was alarmed at the success of the invaders. He sent a flotilla down the Caspian, and the province of Gilan south-west of the Caspian; and Peter made a treaty with Tahmasp II. in July 1722, by which he agreed to drive the Afghans out of Persia on condition that Dargand (Ostasp) was to throw himself up as Sultan of Kandahar, and Ashraf was ceded to Russia in perpetuity. These were all the richest and most important provinces of Persia.

Meanwhile the invader, in 1723, invited 300 of the principal Persian nobility to dinner, and murdered them. Thousands of their children rising up in vengeance they were all murdered also. Then he proceeded to slaughter vast numbers of the citizens of Isfahan, until the place was nearly depopulated. Not content with this, in 1725 he pillaged the city. But the whole of his army, except the shah, in the court-yard of the palace, and caused them all to be murdered, commencing the massacre with his own hand. The wretched Hossain was himself wounded in endeavouring vainly to save his infant son, only five years of age. All the smaller royal family, except Hosain himself, Tahmasp, and two children, are said to have perished. At length the inhuman miscreant Mahmud died, at the early age of twenty-seven, on the 22nd of April 1725. With scarcely any neck, he had round shoulders, a broad nose, a flat nose, a thin beard, and squinting eyes, which were generally dark.

Mahmud was succeeded by his first cousin, Asraf, the son of Mir 'Abdallah; he was a brave but cruel Afghan. He gave the destruction of the city of Isfahan, and afterwards turned his attention to acquire popularity. In 1727, after a short war, he signed a treaty with the Turks, acknowledging the sultan as chief of the Moslems. But the fortunate star of Tahmasp II. was now beginning to wane. At the beginning of 1728, a large number of Afghans had collected a small army in Mazandaran, and was supported by Fath 'Ali Khan, the powerful chief of the Kajar tribe. In 1727

1 We have an account of the Afghan invasion and sack of Isfahan from an eye-witness, Father Krusinski, procurator of the Jesuits at that place, whose interesting work was translated into English in the late 18th century.

2 In 1721 Sultan Hosain sent an embassy to the Russians, seeking aid against the Afghans. In May 1722 a flotilla descended the Volga commanded by Tsar Peter and on the 19th of July the Russian flag first waved over the Caspian. Gilan was occupied by 6000 men under General Makran.

3 The Russians remained in Gilan until 1734, when they were obliged to evacuate it, owing to the unhealthiness of the climate.
Georgi and part of Azerbaijan—and he had threatened Bagdad with assault. As regent, he had failed twice in taking the city of the caliphs, but on the second occasion he had defeated and killed its gallant defender, Topal-Othman, and he had succeeded in regaining Tiflis, Kirk and Erivan.

Russia and Turkey, naturally hostile to one another, had taken occasion of the weakness of Persia to forget their mutual quarrels and unite to plunder the tottering kingdom of the Safavid kings. A partition treaty had been signed between these two powers in 1723, by which the cazar was to take Astrakhan, Mazendaran, Gilan, part of Shirvan and Daghestan, while the acquisitions of the Porte were to be traced out by a line drawn from the junction of the Aras and Kur rivers, and passing along by Ardebil, Tabriz and Hamadan, and thence to Kermanshah. Tahmasp was to retain the rest of his paternal kingdom on condition of his recognizing the treaty. The ingenious diplomacy of Russia in this transaction was manifested in the fact that she had already acquired the greater part of the territory allotted to her, while Turkey had to obtain her share by further conquest. But the combination to despoil a feeble neighbour was outwitted by the energy of a military commander of a remarkable type.

D.—From the Accession of Nadir Shah, in 1736, to 1884.

Nadir, it has been said, was proclaimed shah in the plains of Moghan in 1736. Mirza Mahdi relates how this event was brought about by his address to the assembled nobles and officers on the morning of the "Nau-ruz," or New-Year's Day, the response to that appeal being the offer of the crown. The conditions were that the crown should be hereditary in his family, that the claimant of the Safawids was to be held for ever extinct, and that measures should be taken to bring the Shi'ites to accept uniformity of worship with the Sunnites. The mulla bashi (or high priest) objecting to the last, Nadir ordered him to be strangled, a command which was carried out on the spot. On the day following, the agreement having been ratified between sovereign and people, he was proclaimed emperor of Persia. At Kazvin the ceremony of inauguration took place. The edict expressing the royal will on the religious question is dated in June, but the date of coronation is uncertain. From Kazvin Nadir moved to Isfahan, where he organized an expedition against Kandahar, then in the possession of a brother of Mahmud, the conqueror of Shah Hosain. But before setting out for Afghanistan he took measures to secure the internal quiet of Persia, attacking and seizing in his stronghold the chief of the marauding Bakhtris, whom he put to death, retaining many of his men for service as soldiers. With an army of 80,000 men he marched through Khorasan and Seistan to Kandahar, which city he blockaded ineffectually for a year; but it finally capitulated on the loss of the citadel. Balkh fell to Riza Kuli, the king's son, who, moreover, crossed the Oxus and defeated the Uzbegs in battle. Besides tracing out the lines of Nadirabad, a town since merged in modern Kandahar, Nadir had taken advantage of the time available and of opportunities presented to enlist a large number of men from the Abdali and Ghilzai tribes. It is said that as many as 16,000 were at his disposal. His rejection of the Shi'ite tenets as a state religion seems to have propitiated the Sunnite Afghans.

Nadir had sent an ambassador into Hindustan requesting the Mogul emperor to order the surrender of certain unruly Afghans who had taken refuge within Indian territory, but no satisfactory reply was given, and obstacles were thrown in the way of the return of the embassy. The Persian monarch, not sorry perhaps to find a plausible pretext for encroachment in a quarter so full of promise to booty-seeking soldiers, pursued some of the fugitives through Ghazni to Kabul, which city was then under the immediate control of Nasr Khan, governor of eastern Afghanistan, for Mahomed Shah of Delhi. This functionary, alarmed at the near approach of the Persians, fled to Peshawar. Kabul and long been considered not only an integral part but also one of the main gates of the Indian Empire; notwithstanding a stout resistance on the part of its commandant, Shir or Shizrah Khan, the place was stormed and carried (1738) by Nadir, who moved in with haste. Mirza Mahdi relates that when some of his men withdrew, he addressed a new remonstrance to the Delhi court, but that his envoy was arrested and killed, and his escort compelled to return by the governor of Jalalabad. The same authority notes the occupation of the latter place by Persian troops and the march thither from Gandamak. It was probably through the Khahar (Khyber) Pass that he passed into the Peshawar plain, for it was there that he first defeated the Imperial forces.

The invasion of India had now fairly commenced, and its successful progress and consummation were mere questions of time. The prestige of this Eastern Napoleon was immense. It had not only reached but had been very keenly felt at Delhi before the conquering army had arrived. There was no actual religious war; all sectarian distinction had been dissolved; the contest was between vigorous Mahomedans and effete Mahommedans. Nadir's way had been prepared by circumstances, and as he progressed from day to day his army increased. There must have been larger accessions by voluntary recruits than losses by death or desertion. The victory on the plain of Karnal, whether accomplished by sheer fighting or the intervention of treachery, was the natural outcome of the previous situation, and the submission of the emperor followed as a matter of course.

Delhi must have experienced a sense of relief at the departure of its conqueror, whose residence there had been rendered painful and uneasy by carnage and riot. The marriage of his son to the granddaughter of Aurangzeb and the formal restoration of the crown to the dethroned emperor were doubtless politic, but the descendant of Babar could not easily forget how humiliating a chapter in history would remain to be written against him. The return march of Nadir to Persia is not recorded with precision. On the 5th of May 1739 he left the gardens of Shalamar, and proceeded by way of Lahore and Peshawar through the passes to Kabul. Thence he seems to have returned to Kandahar, and in May 1740—just one year after his departure from Delhi—he was in Herat displaying the imperial throne and other costly trophies to the gaze of the admiring inhabitants. Sind was certainly included in the cession to him by Mahomed Shah of "all the territories westward of the river Attok," but only that portion of it, such as Thattah (Tatta), situated on the right bank of the Indus.

From Herat he moved upon Balkh and Bokhara, and received the submission of Alt-i-Paiz Khan, the Uzbek ruler, whom he restored to his throne on condition that the Oxus should be the acknowledged boundary between the two empires. The khan of Khwarizm, who had made repeated depredations in Persian territory, was taken prisoner and executed. Nadir then visited the strong fortress of Kelat, to which he was greatly attached as the scene of hisboyish exploits, and Meshed, which he constituted the capital of his empire. He had extended his boundary on the east to the Indus, and to the Oxus on the north. On the south he was restricted by the Arabian Ocean and Persian Gulf; but the west remained open to his further progress. He had in the first place to revenge the death of his brother Ibrahim Khan, slain by the Lesghians; and a campaign against the Turks might follow in due course. The first movement was unsuccessful, and indirectly attended with disastrous consequences. Nadir, when hastening to the support of some Afghan levies who were doing good service, was fired at and wounded by a stray asslauntant; suspecting his son, Riza Kuli, of complicity, he commanded the unfortunate prince to be seized and deprived of sight. From that time the heroism of the monarch appeared to die out. He became morose, tyrannical and suspicious. An easy victory over the Turks gave him but little additional glory; and he readily concluded a peace with the sultan which brought but 14 Malcolm.
 insignificant gain to Persia. Another battle won from the Ottoman troops near Diarbekr by Naṣr ʿUlā Mirza, the young prince who had married a princess of Delhi, left matters much the same as before. The last years of Naṣirid's life were full of internal trouble. On the part of the sovereign, murders and executions; on that of his subjects, revolt and conspiracy. Such a state of things could not last, and certain proscribed persons plotted the destruction of the half-demented tyrant. He was despatched by Salāḥ Bey, captain of his guards (1747). He was some sixty years of age, and had reigned eleven years. About the time of setting out on his Indian expedition he was described as a most comely man, upwards of 6 ft., tall, well-proportioned, of robust make and constitution; inclined to be fat, but prevented by the fatigue he underwent; with fine, large black eyes and eyebrows; of sanguine complexion, more manly by the influence of sun and air on the healthy frame he possessed. His voice was loud, fond of simple diet, such as pilafs and plain dishes, but often neglectful of meals altogether, and satisfied, if occasion required, with parched peas and water, always to be procured. During the reign of Naṣir an attempt was made to establish a British Caspian trade with Persia. The names of Jonas Hanway and John Elton were honourably connected with this undertaking; and the former has left most valuable records of the time and country.

From Naṣir Shah to the Kajar Dynasty.—After the death of Naṣir Shah something like anarchy prevailed for thirteen years in the greater part of Persia as it existed under his son Ṣtāfār-ʿAbbās. No sooner had the crime become known than Ahmad Khan, chief of the Abdali Afghans, took possession of Kandahar and a certain amount of treasure. By the action of Ahmad Abdali, Afghanistan was once lost to the Persian crown, for this leader was strong enough to found an independent kingdom. The chief of the Bakhtiari, Rashid, also with treasure, fled to the mountains, and the conspirators invited 'Ali, a nephew of the deceased monarch, to ascend the vacant throne. The Bakhtiari encouraged his brother, 'Ali Mardan, to compete for the succession to Naṣir. The prince was welcomed by his subjects; he told them that the murder of his uncle was due to his own instigation, and, in order to conciliate them, remitted the revenues of the current year and all extraordinary taxes for the two years following.

Taking the title of 'Adil Shah, or the "just" king, he commenced his reign by putting to death the two princes Rīzā Kūlī and Naṣr ʿUlā, as well as all relatives whom he considered his competitors, with the exception of Shah Rukh, son of Rīzā Kūlī, whom he spared in case a lineal descendant of Naṣir should at any time be required. But he had not removed all dangerous members of the royal house, nor had he gauged the temper of the times or people. 'Adil Shah was soon dethroned by his own brother, Ibrahim, and he in his turn was defeated by the adherents of Shah Rukh, who made their leader king.

This young prince had a better and more legitimate title than that of the grandson of Naṣir, for he was also grandson, on the mother's side, of the Safavid Shah Husain. Amiable, generous and liberal-minded, and of possessing exterior, he proved to be a proper king. But he was neither of an age nor character to rule over a people led by turbulent and disaffected chiefs, ever divided by conflicting interests of personal ambition. Saʿd Mahomed, son of Mizrā Dirkī, a chief mullah at Meshed, whose mother was the reputed daughter of Suleiman, declared himself king, and imprisoned and blinded Shah Rukh. 'Adil Shah, the general commanding the royal troops, defeated and slew Suleiman, and replaced his master on the throne, reserving to himself the protectorship or regency. A new combination of chiefs, of which Jā'far the Kurd and Mir ʿAlam the Arabian are the principal names headed down, brought about the death of Yusuf ʿAli and the second imprisonment of Shah Rukh. These events were followed by a quarrel terminating in the supremacy of the Arab. At this juncture Ahmad Shah Abdali reappeared in Persian Khorasan from Herat; he attacked and took possession of Meshed, slew Mir ʿAlam, and, pledging the local chiefs to support the blinded prince in retaining the kingdom of his grandfather, returned to Afghanistan. But thenceforward this unfortunate young man was a mere shadow of royalty, and his purely local power and prestige had no further influence wherever on Persia as a country.

The land was partitioned among several distinguished persons, who had of old been biding their opportunities, or were born of the occasion. Foremost among these was Mahommed Ḥasan Khan, hereditary chief of those Kajars who were established in the south-east corner of the country. His nephew, Fath ʿAli Khan, after sheltering Shah Tahmasp II. at his home in Asarabad, and long acting as one of his most loyal supporters, had been put to death by Naṣir, who had appointed a successor to his chiefdom from the "Yukari" or "upper" Kajars, instead of from his own, the "Ashagha," or "lower." Mahommed, with his brother, had fled to the Turkomans, by whose aid he had attempted the recovery of Asarabad, but had not succeeded in regaining a permanent footing there until Naṣir had been removed. On the murder of the tyrant he had raised the standard of independence, successfully resisted Ahmad Shah and his Afghans, who sought to check his progress in the interests of Shah Rukh, and eventually brought under his own sway the valuable provinces of Gilan, Mazandaran and Asarabad—quite a little kingdom in itself. In the large important province of Azerbaijan, Azad Khan, one of Naṣir's generals, had established a separate government; and 'Ali Mardan, brother of the Bakhtiari chief, had taken forcible possession of Isfahan, empowering Shah Rukh's governor, Abu'l-Fath Khan, to act for the new master instead of the old.

Had 'Ali Mardan declared himself an independent ruler he would have been by far the most important of the three persons named. But such usurpation at the old Safawid capital would have been too flagrant an act for general assent; so he put forward Isma'il, a nephew of Shah Husain, as the representative of sovereignty, and himself as one of his two ministers—the other being Karim Khan, a chief of the Zend Kurds. Shah Isma'il, it need scarcely be said, possessed no real authority; but the ministers were strong men in their way, and the Zend especially had many high and excellent qualities. After a time 'Ali Mardan was assassinated, and Karim Khan became the new dey of power at Isfahan. The story of the period is thus told by R. G. Watson:—

"The three rivals, Karim, Azad and Muhammad Hasan, proceeded to settle, by means of the sword, the question as to which of them was to be the sole master of Persia. A three-sided war then ensued, in the course of which each of the combatants in turn seemed at one time sure to be the eventual conqueror. Karim, who had the better command of matters at Isfahan, marched to the borders of Mazandaran, where the governor of that province was ready to meet him. After a closely contested battle victory remained with Muhammad Hasan, who, however, did not follow up the foe, as he had to return in order to encounter Azad. That leader had invaded Gilan, but, on the news reaching him of the victory which the governor of Mazandaran had gained, he thought it prudent to retire his steps to Sultan Abad. Karim, who had thus been driven out of Kazvin, a position from which he was enabled to inflict much injury on the army of Karim, while his own troops remained unharmed, behind the walls of the town. Karim retired a second time to

There were three branches of the Kajar tribe, i.e. the Suldus, Tungkut and Jalayir. The last, according to Watson, became settled in Iran and Turan, and seem at first to have given their name to all the tribe.

4 Watson. Malcolm says that Gilan was under one of its own chiefs, Haidayut Khan.
Ispahan, and in the following spring advanced again to meet Azad. A pitched battle took place between them, in which the army of Karim was defeated. He retreated to the capital, closely pressed by the foe. Thence he continued his way to Shiraz, but Azad was still upon his traces. He then threw himself upon the mercy of the Arabs of the Gaerishur or hot country, near the Persian Gulf, to whom the name of the Afghans was hateful, and who rose in a body to turn upon Azad. Karim, by their aid, once more repaired his losses and advanced on Ispahan. Muhammad had fifty thousand men waiting from the opposite direction, ready to encounter either the Afghan or the Zend. The Afghan did not await his coming, but retired to his government of Tabriz.

The Zend issued from Ispahan, and was a second time defeated in a battle near Kajurande. The Zend took refuge behind the walls of Shiraz, and all the efforts of the enemy to dislodge them were ineffectual. Muhammad Hasan Khan in the following year turned his attention to Adarabjan. Azad was no longer in a position to co-operate with his rival, and so in turn became master of the province. The Zend took possession of the whole of the country, while Azad had to seek assistance in vain—first from the pasha of Baghdad, and then from his former enemy, the tsar of Georgia. Next year the conquering Kajar returned to Shiraz to make an end of the only rival who stood in his way. On his side were 80,000 men, commanded by a general who had twice defeated the Zend chief on an equal field. Karim was still obliged to take shelter in Shiraz, and to employ artifices in order to supply the place of the force in which he was deficient. Nor were his efforts in this respect unattended with success: seduced by his gold, many of the troops of the Kajar began to desert their banners. In the meantime the neighbourhood of Shiraz was laid waste, so as to destroy the crops from which Muhammad Hasan Khan drew his resources; by degrees his army perished, and he had finally to retreat with rapidity to Ispahan with the few men that remained to him. Finding his position there to be untenable, he retreated still farther to the country of his ancestors, the Kajars. There he received the submission of nearly all the chief cities of Persia. The eldest of Karim's officers, Shaikh 'Ali, was sent in pursuit of the Kajar chief. The fidelity of the commander to whom that chief-elect had commended the care of the pass leading into Mazandaran was corrupted; and, as no further retreat was open to him, he found himself under the necessity of fighting. The conflict which ensued resulted in his complete defeat, although he presented to his followers an example of extraordinary energy. When this chief effect his escape he was recognized by the chief of the other branch of the Kajar tribe, who had deserted his cause, and who had a blood-feud with him, in pursuance of which he now put him to death.

For nineteen years after this event Karim Khan ruled with the title of wakil, or regent, over the whole of Persia, excepting the province of Khurasan. He made Shiraz the seat of government, and an example of his brother's end, with the object of subverting his authority. The rule of the great Zend chief was just and mild, and he is on the whole, considering his education and the circumstances under which he was placed, one of the most faultless characters to be met with in Persia.

Karim Khan died at his capital in 1779 in the twentieth year of his reign, and it is said, in the eightieth of his age. He built the great bazaar of Shiraz, had a tomb constructed over the remains of Hafiz, and repaired the "turbat" at the grave of Sa'di, outside the walls. He encouraged commerce and agriculture, gave much attention to the shores of the Persian Gulf, and carefully studied the welfare of the Armenian community settled in his dominions. In his time the British factory was removed from Bander Abbasi to Bushire.

On Karim's death a new period of anarchy supervened. His brother, Zaki, a cruel and vindictive chief who, when governor of Isfahan, had revolted against Karim, assumed the government. At the same time he proclaimed Yaw 'Ishak Khan, second son of the deceased monarch, and his brother Mahmood 'Ali, joint-successors to the throne. The seizure of the citadel at Shiraz by the adherents of the former, among whom were the more influential of the Zend's, may have induced him to adopt this measure as one of prudent conciliation. But the garrison, in a panic, and put to flight, he had found it impossible to rescue the palace. The suspicious sultans were soon adjoined to trust themselves to his keeping, under promise of forgiveness. They believed his professions, tendered their submission, and were cruelly butchered. Zaki did not long enjoy the fruits of his perfidious dealing. The death of Karim Khan had raised two formidable adversaries to mar his peace.

Aga Mahmomed, son of Mahmood Hasan, the Kajar chief of Astarbad, a prisoner at large in Shiraz, was in the environs of that city awaiting intelligence of the old king's decease, and, hearing it, instantly escaped to Mazandaran, there to gather his followers. Another son of Zaki, who reigned at Persia, having been a prisoner by Nadir and barbarously mutilated by 'Adil Shah, had afterwards found means to rejoin his people, but had surrendered himself to Karim Khan when his father was killed in battle. On the other hand, Sadik, brother to Zaki, who had won considerable and deserved repute by the capture of Basra from the Turkish governor, abandoned his hold of the conquered town on hearing of the death of Karim, and appeared with his army before Shiraz. To provide against the intended action of the first, Zaki detached his nephew, 'Ali Murad, at the head of his best troops to proceed with all speed to the north; and, as to the second, the seizure of such families of Sadik's followers as were then within the walls of the town, and other violent measures, struck such dismay into the hearts of the besieging soldiers that they dispersed and abandoned their leader to his fate. From Kermán, however, where he found an asylum, the latter addressed an urgent appeal for assistance to 'Ali Murad. This chief, encamped at Teheran when the communication reached him, submitted the matter to his men, who decided against Zaki, but put forward their own captain as the only master they would acknowledge. 'Ali Murad, the descendant of Aga Mahmomed, then returned to Isfahan, where he was received with satisfaction, on the declaration that his one object was to restore to his lawful inheritance the eldest son of Karim Khan, whom Zaki had set aside in favour of a younger brother. The sequel is full of dramatic interest. Zaki, enraged at his nephew's desertion, marched out of Shiraz towards Isfahan. On his way he came to the town of Yezdlikhast, where he demanded a sum of money from the inhabitants, claiming it as part of secreted revenue; the demand was refused, and eighteen of the head men were thrown down the precipice beneath his window; a saiyid, or holy man, was the next victim, and his wife and daughter were to be given over to the soldiery, when a suddenly-formed conspiracy took effect, and Zaki's own life was taken in retribution for his guilt (1779).

When intelligence of these events reached Kermán, Sadik Khan hastened to Shiraz, proclaimed himself king in place of Abu 'I-Fath Khan, whom he declared incompetent. 'Ali Murad ventured to reign, and put out the eyes of the young prince. He dispatched his son Jafar to assume the government of Isfahan, and watch the movements of 'Ali Murad, who appears to have been then absent from that city; and he gave his younger son, 'Ali Naki, command of an army in the field. The campaign ended in the capture of Shiraz and assumption of sovereignty by 'Ali Murad, who caused Sadik Khan to be put to death.

From this period up to the accession of Aga Mahmomed Khan the summary history of Markham will supply the principal facts required.

'Ali Murad reigned over Persia until 1785, and carried on a successful war with Aga Mahmomed in Mazandaran, defeating him in several engagements, and occupying Teheran and Sari. He died on his way from the former place to Isfahan, and was succeeded by his son Jafar, who was raised to the government by an able but unprincipled "kalantar," or head magistrate, named Haji Ibrahim. This ruler was poisoned by the agency of conspirators, one of whom, Sayyid Murad, succeeded to the throne of Haji Ibrahim, however, continuing to maintain the loyalty of the citizens towards the Zend reigning family, the usurper was killed, and Lutf 'Ali Khan, son of Jafar, proclaimed king. He had hastened to Shiraz on hearing of his father's death, and was joined by the inhabitants. Haji Ibrahim became his chief adviser, and a new minister was formed for him in Mirza Hosain Shirazi. At the time of his accession Lutf 'Ali Khan was only in his twentieth year, very grave, tall, graceful, and an excellent horseman. He differed widely in character, he was a worthy successor of Karim Khan, the great founder of the Zend dynasty. Lutf 'Ali Khan had not been many months on the throne when Aga Mahmomed advanced to attack him, and invested the city of Shiraz, but retreated soon afterwards to Teheran, which he had made the capital of his dominions. The young king then enjoyed a short period of peace.

1 A five days' usurpation of Bakir Khan, governor of Isfahan, is not taken into account.
Afterwards, in 1790, he collected his forces and marched against the Kajars, in the direction of Isfahan. But Hajji Ibrahim had been intriguing against his sovereign, to whose family he owed everything, not only with his officers and soldiers but also with Aga Mahommed, chief of the Kajars, and a member of the family of the Zends. Lutf 'Ali Khan was suddenly deserted by the whole of his army, except seventy faithful followers; and when he retreated to Shiraz he found the gates closed against him by Hajji Ibrahim, who, having taken advantage of the Kajars falling into confusion, Bushire, he found that the sheet of that town had also betrayed him. Surrounded by treason on every side, he boldly attacked and routed the chief of Bushire and blocked Shiraz. His unconquered spirit was only the more courageous to resist, and he defeated an army sent against him by the Kajars in 1792.

Aga Mahommed then advanced in person against his rival. He encamped with an army of 30,000 men on the plain of Mardasht, near Isfahan, in the middle of the summer. Lutf 'Ali Khan, who was in possession of the camp of his enemy with only a few hundred followers. The Kajars were completely routed and thrown into confusion; but Aga Mahommed, with extraordinary presence of mind, remained in his position, and, suddenly, at a signal given by a miscreant one of his followers, he sent a small force to take Kajars of Khorasan, where he succeeded in collecting a few followers; but advancing into Isfahan, he was again defeated and forced to take refuge at Kandahar.

In 1794, however, the undaunted prince once more crossed the Persian frontier, determined to make a last effort, and either regain his throne or die in the attempt. He occupied the pass of Kermána, then the half-way between the Persian Gulf and the province of Khorasan. Aga Mahommed besieged it with a large army in 1795, and, after a stout resistance, the gates were opened to him by treachery. For three hours the gallant young aga was fought in the streets with determined valour, but in vain. When he saw that all hope was gone he, with only three followers, fought his way through the Kajar host and escaped to Bam-Narmashir, the north-eastern district of the province of Kermána on the borders of Seistan.

Furious at the escape of his rival, the savage conqueror ordered a general massacre; 20,000 women and children were sold into slavery; and many of the inhabitants of Kermána were brought to Aga Mahommed on a platter.

Lutf 'Ali Khan took refuge in the town of Bam; but the governor of Bam, Narnashir, anxious to propitiate the conqueror, basely surrounded him as he was mounting his faithful horse Krán to seek more secure asylum. The young prince fought bravely; but, being badly wounded and overpowered by numbers, he was secured and sent to the camp of the Kajar chief. The spot where he was seized at Bam, at the foot of his horse, was given him in his lifetime, by order of his revengeful enemy, of the skull's of the most faithful of his adherents. The most hideous indignities and atrocities were committed upon him by the cruel Kajar, and finally he was beheaded and when we opened his body in his sixth year. Every member of his family and every friend was ordered to be massacred by Aga Mahommed; and the successful miscreant thus founded the dynasty of the Kajars at the price of all that best and last of France of his own eyes.

The Zend is said to be a branch of the Lak tribe, dating from the time of the Kaianian kings, and claims to have been charged with the care of the Zend-Avesta by Zoroaster himself. The tree attached to Markham's chapter on the dynasty contains the names of eight members of the family only, i.e., four brothers, one of whom had a son, grandson and great-grandson, and one a son. Four of the eight were murdered, one was blinded, and one cruelly mutilated. In one case a brother murdered a brother, in another an uncle blinded his nephew.

Kajar Dynasty.—Aga Mahommed was undoubtedly one of the most cruel and vindictive despots that ever disgraced a throne. But he was not without care for the honour of his empire in the eyes of Europe and the outer world, and his early career in Mazandaran gave him a deeply-rooted mistrust of Russia, with the officers of which power he was in constant contact. The following story, told by Forster,⁷ and varied by a later writer, is characteristic. A party of Russians having obtained permission to build a 'counting-house' at Ashraf, in the bay of that name, erected instead a fort with eighteen guns. Aga Mahommed, learning the particulars, visited the spot, expressed great pleasure at the work done, invited the officers to dine with him, imprisoned them, and only spared their lives when they had removed the whole of the cannon and razed the fort to the ground. This occurrence must have taken place about 1782.

Forster was travelling homeward by the southern shores of the Caspian in January 1784, and from him we gather many interesting details of the locality and period. He calls Aga Mahommed chief of Mazandaran, as also of Astarabad and "some districts situate in Khurasan," and describes his tribe the Kajar, to be, like the Indian Rajput, usually devoted to the profession of arms. Whatever hold his father may have had on Gilan, it is certain that this province was not then in the son's possession, for his brother, Jif'ír'í Kulí, governor of Balfrish (Balfrosh), had made a recent incursion into it and driven Hidayat Khan, its ruler, from Resht to Enzeli, and Aga Mahommed himself meditating another attack on the same quarter. The latter's palace was at Sari, then a small and partly fortified town, thickly inhabited, and with a plentifully-supplied market.

As "the most powerful chief in Persia" since the death of Karim Khan, the Russians were seeking to put their yoke upon him.

Aga Mahommed's power increased, his dislike and jealousy of the Muscovite assumed a more practical shape. His victory over Lutf 'Ali was immediately followed by an expedition into Georgia. After the death of Nadir the wall of that country had looked around him for the safest means of shaking off the yoke of Persia; and in course of time an opportunity had offered of a promising kind. In 1783, when the strength of the Persian monarchy was concentrated upon Isfahan and Shiraz, the Georgian tside Heraclius entered into an agreement with the empress Catherine of, whose all connection with the shah was disavowed, and a quasi-vassalage to Russia substituted—the said empire extending her aegis of protection over her new ally. Aga Mahommed now demanded that Heraclius should return to his position of tributary and vassal to Persia, and, as his demand was rejected, prepared for war. Dividing an army of 60,000 men into three corps, he sent one of these into Daghestan, another was to attack Erivan, and with the third he himself laid siege to Shusha in the province of Karabakh. The stubborn resistance offered at the last-named place caused him to leave there a small investing force only, and to move on with the remainder of his soldiers to join the corps d'armée at Erivan. Here, again, the difficulties presented caused him to repeat the same process and to effect a junction with his first corps at Ganja, the modern Elisavetpol. At this place he encountered the Georgian army under Heraclius, defeated it, and marched upon Tiflis, which he pillaged, massacring and enslaving ⁸ the inhabitants. Then he returned triumphant to Teherán, where (or at Ardabil on the way) he was publicly crowned shah of Persia. Erivan surrendered, but Shusha continued to hold out. These proceedings caused Russia to enter the field. Derbent was taken possession of by Imhov, Baku and Shumakly were occupied and Gilan was threatened. The death of the empress, however, caused the issue of an order to retire, and Derbent and Baku remained the only trophies of the campaign.

In the meantime Aga Mahommed's attention had been called away to the east. Khorsar could hardly be called an integral part of the shah's kingdom so long as it was under Even the nominal rule of the blind grandson of Nadir. But the eastern division of the province and its outlying parts were actually in the hands of the Afghans, and Meahod was not Persian in 1796 in the sense that Delhi was British at the outbreak of the Indian Mutiny. Shah Rukh held his position, such as it was, rather under Almájad

¹ Markham. Morier says of Karim Khan's family, "it was a low branch of an obscure tribe in Kurdistan."

² Journey from Bengal to England (1789), ii. 201; see also Markham, pp. 341, 342.

³ Lady Shelley says (1849): "I saw a few of these unhappy captives who all had to embrace Mahomedanism, and many of whom had risen to the highest stations, just as the Circassian slaves in Constantinople;"
Shah and his successors in Afghanistan than under any other sovereign power. Aga Mahommed determined to restore the whole province to Persia, and, after a brief residence in Teheran on his return from the Georgian expedition, he set out for Meshed. It is important to note that on the occasion of his coronation he had girded on the sabre consecrated at the tomb of the founder of the Safawid—thus openly pledging himself to support the Shi’ite faith.

But there had been continual dissatisfaction in the capital of Khorasan, and constant inroads upon it from without, which the royal puppet was unable to prevent. His popularity was real, but never seemed to have effect outside the limited sphere of personal sympathy and regard. Owing to the frequent revolutions in the holy city the generals of Timur Shah, king of the Afghans, had made three expeditions on Shah Rukh’s behalf. Meshed had been taken and retaken as though he were not a resident in it, much less its de jure king. Moreover, his two sons Nadir Mirza and Wali Ni’amat had long been fighting, and the former was in 1796 the actual ruler of the place. Three years before Timur had died, and his third son, Zaman Shah, by the intrigues of an influential sirdar, Faiyanda Khan, and been proclaimed his successor at Kabul.

Aga Mahommed’s entry into Meshed was effected without a struggle on the part of those in possession. The Kajar Shah walked on foot to the tomb of Imam Riza, before which he knelt and kissed the ground in token of devotion, and was recognized as a Shi’ite of Shi’ites. Shah Rukh submissively followed in his train. Then began the last act of the local tragedy. The blind king’s gradual revelation, under horrible torture, of the place of concealment of his several jewels and treasures, and his deportation and death (of the injuries thus received, at Damghan, en route to Mazandaran), must be classed among the darkest records of Oriental history.

From Meshed Aga Mahommed sent an envoy to Zaman Shah, asking for the cession of Balkh, and explaining his invasion of Khorasan; but the Afghan monarch was too perplexed with the troubles in his own country and his own insecure position to do more than send an unmeaning reply. It is not shown what was the understood boundary between the two countries at this particular period; but Watson states that on the shah’s departure he had received the submission of the whole of Khorasan, and left in Meshed a garrison of 12,000 men.

Aga Mahommed had now fairly established his capital at Teheran. On his return thither in September 1796 he dismissed his troops for the winter, directing their reassembly in the following spring. The re-invasion by Russia of the provinces and districts he had recently wrested from her west of the Caspian had made great progress, but the circumstance does not seem to have changed his plans for the army. Although, when the spring arrived and the shah led his forces to the Aras, the Russians had, it is true, retreated, yet territory had been regained by them as far south as the Talysch. Aga Mahommed had now added to his career. He was enabled, with some difficulty, to get his troops across the river and take possession of Shisha, which had given them so much trouble a year or two before. There, in camp, he was murdered (1797) by his own personal attendants—men who were under sentence of death, but allowed to be at large. He was then fifty-seven years of age, and had ruled over part of Persia for more than eighteen years—over the kingdom generally for about three years, and from his coronation for about one year only.

The brutal treatment he had experienced in boyhood under the orders of ‘Adil Shah, and the opprobrious name of “eunuch” with which he was taunted by his enemies, no doubt contributed to embitter his nature. His contempt of luxury, his avoidance of hyperbole and dislike of excessive ceremony, his protection to commerce and consideration for his soldiers, the reluctance with which he assumed the crown almost at the close of his reign—all these would have been praiseworthy in another man; but on his death the memory of his atrocious tyranny alone survived. Those who have seen his portrait once will recognize the face wherever presented. “Beardless and shrivelled,” writes Sir John Malcolm, “it resembled that of an aged and wrinkled woman, and the expression of his countenance, at no time pleasant, was horrible when clouded, as it very often was, with indignation. He was sensible of this, and could not bear that any one should look at him.”

Aga Mahommed had made up his mind that he should be succeeded by his nephew Fath ‘Ali Shah, son of his full brother, Hosain Kuli Khan, governor of Fars. There was a short interval of confusion after the murder. The remains of the sovereign were exposed to insult, the army was disturbed, the recently captured fort on the left bank of the Aras was abandoned; but the wisdom and resolution of the minister, Hajji Ibrahim, and of Mirza Mahommed Khan Kajar secured order and acceptance of the duly appointed heir. The first, proclaiming his own allegiance, put himself at the head of a large body of troops and marched towards the capital. The second closed the gates of Teheran to all comers until Fath ‘Ali Shah came himself from Shiraz. Though instantly proclaimed on arrival, the new monarch was not crowned until the spring of the following year (1798).

The so-called rebellions which followed were many, but not of any magnitude. Such as belong to local history are three in number, i.e. that of Sadik Khan Shakhaki, the general whose possession of the crown jewels enabled him, after the defeat of his army at Kazvin, to secure his personal safety and obtain a government; of Hosain Kuli Khan, the shah’s brother, which was compromised by the mother’s intervention; and of Mahommed, son of Zaki Khan, Zend, who was defeated on more than one occasion in battle, and fled into Turkish territory. Later, Sadik Khan, having again incurred the royal displeasure, was seized, confined and mercilessly bricked up in his dungeon to die of starvation.

Another adversary presented himself in the person of Nadir Mirza, son of Shah Rukh, who, when Aga Mahommed appeared before Meshed, had taken refuge with the Afghans. Fath ‘Ali sent to warn him of the consequences, but without the desired effect. Finally, he advanced into Khorasan with an army which appears to have met with no opposition save at Nishapur and Turbet, both of which places were taken, and when it reached Meshed, Nadir Mirza tendered his submission, which was accepted. Peace having been further cemented by an alliance between a Kajar general and the prince’s daughter, the shah returned to Teheran.

Now that the narrative of Persian kings has been brought up to the period of the consolidation of the Kajar dynasty and commencement of the 19th century, there remains but to summarize the principal events in the reigns of Fath ‘Ali Shah and his immediate successor, Mahommed Shah. (1799-1820.)

Fath ‘Ali Shah came to the throne at about thirty-two years of age, and died at sixty-eight, after a reign of thirty-six years. Persia’s great aim was to recover in the north-west, as in the north-east, her empire, the geographical limits obtained for her by the Safawid kings; and this was no easy matter when she had to contend with a strong European power whose territorial limits touched her own. Fath ‘Ali Shah undertook, at the outset of his reign, a contest with Russia on the western side of the Caspian, with the idea of forcing Russia to accept the commercial advantages which Georgia was, clearly, not to revert to a Mahommedan suzerain. In 1809 its tsar, George, son and successor of Heraclius, notwithstanding his former professions of allegiance to Persia, renounced the favours of the Russian emperor. His brother Alexander indignantly repudiated the act and resisted its fulfilment, but he was defeated by General Lazlov on the banks of the Lora. Persia then re-entered the field. Among the more noted of the later expeditions was the one under Fath ‘Ali, who in detail fought near Echmiadzin, between the crown prince, ‘Abbass Mirza, and General Zizianov, in which the Persians suffered much from the enemy’s artillery, but would not admit them to be defeated; an unsuccessful attempt was made to get possession of Erivan; and a surprise, in camp, of the shah’s forces, which caused them to disperse, and necessitated the king’s presence with reinforcements. On the latter occasion the shah is credited with gallantly swimming his horse across the Aras, and setting an example of energy and valour. In the following year ‘Abbass Mirza advanced upon Shishah, the chief of which place and of the Karabagh had declared for Russia; much fighting ensued, and Erivan was formally taken possession of in the name of
the shah. The Russians, moreover, made a futile attempt on Gilan by landing troops at Enzeli, which returned to Baku, where Zizanov fell into the treachery of the Persian governor. Somewhat later Ibrahim Khalil of Shusha, repenting of his Russophilism, determined to extirpate the Musulman nation, and with his plans were betrayed, and he and his relatives put to death. Reprisals and engagements followed with varied success; and the crown prince of Persia, after a demonstration in Shirvan, returned to Turkestan. Napoleon, with the help of the Mazaris, was enabled to secure possession of Derbent, Baku, Shirvan, Sheki, Ganja, the Talysch and Mugan, was probably indebted to gold as well as to the force of arms. At the same time Persia would not listen to the terms which were made to her by the governor-general who had succeeded Zizanov.

Relations had now commenced with England and British India. A certain Mahdi 'Ali Khan had landed at Bushire, entrusted by a few attempts of Erivan and Nakhichevan, as well as the cost of the war; and in 1827 the campaign was reopened. Briefly, after successive gains and losses, not only Erivan was taken from Persia but Tabriz also, and the town of Suchan, situated on the left bank of the English envoy, a new treaty was concluded at Turkmenchay, laying down the boundary between Russia and Persia. Amongst the conditions for the latter country were the cession in perpetuity of the town of Baku, with the islands of Talysh and Toprak; an armed vessel in the Caspian, and the payment of a war indemnity of some £3,000,000.

After Russia, the neighbouring state next in importance to the west hands was Iran, or Persia, with whom she was united on the west by a common line of frontier. Selim had not captured, in 1804 and 1805, to allow the Russians to make free use of the south-eastern coasts of the Black Sea, to facilitate operations against the shah's troops; and there had been a passage of arms between the king's eldest son, Mohammed 'Ali Mirza, and Suleiman Pasha, son-in-law of the governor-general of Persia, which is locally credited as a battle won by the former. But, without attempting any conquest, a treaty was concluded with the French emperor at Finkenstein. On the return of the Persian diplomatist, a mission of many officers under General Gardane to instruct and drill the local army was sent from France to Persia. General Gardane was the zemindar of Shirvan, a province from the British government, which, on arrival at Bombay in April 1806, found that it had been anticipated by a previously sent mission from the governor-general of India, under Malcolm, a general then residing there.

The mission, however, proceeded to Bushire, and Malcolm's return thence to India enabled Sir Harford to move on and reach the capital of the shah. A few days before his entry to Erivan Gardane had been dismissed, as the peace of Tilsit deterred France from aiding the shah against Russia. Sir Harford concluded a treaty with Persia the month after his arrival at the capital; but the treaty was, like so many others in those hands, notwithstanding the anomaly of a double mission, Malcolm in 1810 again dispatched as their own particular envoy, he brought with him Captains Lindsay and Christie to assist the Persians in their capitulation, and presented the shah with 250,000 rupees; but there was little occasion for the exercise of his diplomatic ability save in his non-official intercourse with the people, and here he endeavoured, it seems, to the great advantage of himself and his country, to secure a remission of duties. But the publication of the treaty took leave a month afterwards to return via Baku and Basra to India. The next year Sir Harford Jones was relieved as envoy by Sir Gore Ouseley.

Many missions had been resumed with Russia, and in 1812 the British envoy used his good offices for the restoration of peace, but the endeavour failed. To add to the Persian difficulty, in July of this year a treaty was concluded between England and Russia, and this circumstance caused the envoy to direct that British officers should no longer partake in Russo-Persian military operations. Christie and Lindsay, however, resolved to remain at their own risk, and advanced with the Persian army to the Aras. On the 1st of October the force was surprised by an attack of the enemy, and retreated; the next night they were again attacked and routed at Ansludau. Christie fell bravely fighting at the head of his brigade; but Captain Lindsay and officers of the Russian garrison were not left unavenged. About three o'clock in the morning of the 4th other Russian men were responsible for the disaster. Lenkoran was taken by Persia, but by Russia during the next three months; and on the 18th of October 1813, through Sir Gore Ouseley's intervention, the Russian advance-guard entered the city of Erivan, and the Russian troops occupied Georgia and the seven provinces before named, with Karabakh.

On the death of the emperor Alexander in December 1825 Prince Menshikov was sent to Teheran to settle a dispute which had arisen between the Russians and the Persians. The envoy was then detained by Russia could not be admitted, the special envoy was given his congé, and war was recommenced. The chief of Talysh struck this time a blow at the heart of Persia. General Keller, with about 9000 men, then carried all before them; and the hereditary chiefs of Shirvan, Sheki and Baku returned from exile to co-operate with the shah's general in the south. In the course of three weeks the only advanced post held by the governor-general of the Caucasus was the obstinate little fortress of Shusha. But before long all war again changed. Hearing that a Russian force of some 9000 men was concentrated at Tils, Mahmoud Mirza, son of the crown prince, marched against the Persians, but was defeated; and his father war routed more seriously still at Ganja. The shah made great efforts to renew the war; but divisions took place in his son's camp, not conducing to successful operations, and in July 1826, after the Russian force, numbering 9000 men, carried the fortress of Lenkoran, and the approach of an armed vessel in the Caspian, and the payment of a war indemnity of some £3,000,000.

The "wakilu l-mulk," governor of Kerman, told Colonel Goldsmit, when his guest in 1806, that "his father had been Sir John Malcolm's Mishmardar. There never was such a man as Malcolm Sahib; but he was generous in the part of his government, but with his own money also." (Telegraph and Travel, p. 585.)
nor that Fath 'Ali Shah's claim to Meshed, as belonging to the Persian crown, was actively resisted. But the large Province of Khorasan, of which Meshed was the capital, had never been other than a nominal dependency of the crown since the death of Nadir; in the autumn of 1828, the Shah, under pressure from the British, persuaded a large force to bring into subjection all turbulent and refractory chiefs on the east of his kingdom. Yazd and Kerman were the first points of attack; Khorasan was afterwards entered by 'Abbas Mirza, who, on the urging of his father, engaged some hard fighting and much loss of life; several forts and places were captured, among them Kuchan and Serrakah; and it may be concluded that the objects contemplated were more or less attained. The English, who was called the "British detachment" which accompanied the prince. Thus far as regards Yazd, Kerman and Khorasan. It was otherwise with Herat.

Haji Firuz 'd-Din, son of Timur Shah, who was undisturbed in that city, sent a message to Fath 'Ali Shah's successor, and his brother Mahmud had been, as it were, under Persian protection. Persia claimed the principalcy of Herat as part of the empire of Nadir, but her pretensions had been satisfied by payments of tribute or by the retention of the city. Among other things there was the agreement between the two princes, made in 1824 under the influence of Russia, by which the Persian forces, and forced them to retire into their own country. In 1825, on a solicitation from Mustafa Khan, who had got temporary hold of Herat, more troops were despatched thither, but, by the use of force, and a state of affairs, their condition was destroyed. Eight or nine years afterwards 'Abbas Mirza, when at the head of his army in Meshed, invited Yar Mahommed Khan of Herat to discuss a settlement of differences between the two governments. The Persians, being influenced by the disparity of the forces, advanced to Herat itself under the command of 'Abbas Mirza, son of Abbas; but the news of his father's death caused the conqueror to break up his camp and return to Meshed.

Sir Gore Ouseley, who landed in England on the 1st of April in that year, Mr Ellis, the envoy—"Haji Baba" is the infallible proof of his ability and deep knowledge of Persian character—negotiated on the part of Great Britain the Treaty of Teheran. England was to provide troops or a subsidy in the event of any attack on the Persian province of Seistan, over which Persia had long professed to hold the rights of suzerainty. But the king's ambition was to go farther than retaliation or chastisement. He refused to acknowledge any right of dispute or demarcatation. 'Abbas Mirza, when at the head of his army, disdained to accept the conditions of the treaty, and Kandahar and Ghazni were to be recovered, as belonging to the empire of the Safavid dynasty. The advice of the British envoy was dissuasive in this respect, and therefore distasteful.

Sir Gore Ouseley, who landed in England on the 1st of April in that year, was immediately invited to the court of Persia. When the Persian government, finding a temporary submission from 'Abbas Mirza, was again resolved; and Shah Kamran, supported by his vizier, Yar Mahommed, had broken those engagements and pledges on the strength of which Fath 'Ali Shah had withdrawn his troops. In addition to these causes of offence, the Persians suspected the Sikhs, who had been operated on the banks of the Gurgan, and the Turcomans had been driven from one of their strongholds; but little or no progress had been made in the subjection of these marauders, and the Persian king's dispositions were not unfavourable. He gave the Sikhs the truce, and, if that were insufficient, the Shah had better march to Herat. A military council was held at Shahrud, when it was decided to return to the capital and set out again in the spring. Accordingly the Persians retired, and in May the British squadron, under Sir Philip Wood, returned to the Persian Gulf. It was taken advantage of by the British minister to renew his attempts in the cause of peace. Although on the present occasion Simoroch ostensibly aided the British chargé d'affaires M'Neill, who had been operating in this part of the world, it was in 1836, no argument was of any avail to divert the monarch from his new purpose. He again sent his son, the heir apparent, and, invading the Herat territory in November 1837, began the siege on the 23rd of that month.

Not until September in the following year did the Persian army arrive in the city; and then the movement only took place on the action of the British government. M'Neill, who had joined the Persian camp on the 6th of April, left it again on the 7th of June. He arrived in the camp of the British officers, who were in a state of great confusion between the contending parties; but both in this respect and in the matter of a commercial treaty with England, under negotiation, his efforts had been met with evasion and latent hostility. The British officers, in fact, had resolved to go to London in the event of the failure of the negociations, while the British army almost simultaneously with his English colleague, no sooner, at the head of that formidable body, found himself alone in his diplomatic capacity, his aggressive counsels, and he was more than a fortnight had elapsed since M'Neill's return, was in search of a London envoy who could negotiate with the British minister, and, if that were insufficient, the Shah should take the matter himself. The Persians attacked at five points, at one of which they would in all likehood have been successful; but that the efforts had been met with evasion and latent hostility. The British officers, in fact, had resolved to go to London in the event of the failure of the negociations, while the British army almost simultaneously with his English colleague, no sooner, at the head of that formidable body, found himself alone in his diplomatic capacity, his aggressive counsels, and he was more than a fortnight had elapsed since M'Neill's return, was in search of a London envoy who could negotiate with the British minister, and, if that were insufficient, the Shah should take the matter himself.

Sir Gore Ouseley, who landed in England on the 1st of April in that year, immediately invited to the court of Persia. When the Persian government, finding a temporary submission from 'Abbas Mirza, was again resolved; and Shah Kamran, supported by his vizier, Yar Mahommed, had broken those engagements and pledges on the strength of which Fath 'Ali Shah had withdrawn his troops. In addition to these causes of offence, the Persians suspected the Sikhs, who had been operated on the banks of the Gurgan, and the Turcomans had been driven from one of their strongholds; but little or no progress had been made in the subjection of these marauders, and the Persian king's dispositions were not unfavourable. He gave the Sikhs the truce, and, if that were insufficient, the Shah had better march to Herat. A military council was held at Shahrud, when it was decided to return to the capital and set out again in the spring. Accordingly the Persians retired, and in May the British squadron, under Sir Philip Wood, returned to the Persian Gulf. It was taken advantage of by the British minister to renew his attempts in the cause of peace. Although on the present occasion Simoroch ostensibly aided the British chargé d'affaires M'Neill, who had been operating in this part of the world, it was in 1836, no argument was of any avail to divert the monarch from his new purpose. He again sent his son, the heir apparent, and, invading the Herat territory in November 1837, began the siege on the 23rd of that month.

Not until September in the following year did the Persian army arrive in the city; and then the movement only took place on the action of the British government. M'Neill, who had joined the Persian camp on the 6th of April, left it again on the 7th of June. He arrived in the camp of the British officers, who were in a state of great confusion between the contending parties; but both in this respect and in the matter of a commercial treaty with England, under negotiation, his efforts had been met with evasion and latent hostility. The British officers, in fact, had resolved to go to London in the event of the failure of the negociations, while the British army almost simultaneously with his English colleague, no sooner, at the head of that formidable body, found himself alone in his diplomatic capacity, his aggressive counsels, and he was more than a fortnight had elapsed since M'Neill's return, was in search of a London envoy who could negotiate with the British minister, and, if that were insufficient, the Shah should take the matter himself. The Persians attacked at five points, at one of which they would in all likehood have been successful; but that the efforts had been met with evasion and latent hostility. The British officers, in fact, had resolved to go to London in the event of the failure of the negociations, while the British army almost simultaneously with his English colleague, no sooner, at the head of that formidable body, found himself alone in his diplomatic capacity, his aggressive counsels, and he was more than a fortnight had elapsed since M'Neill's return, was in search of a London envoy who could negotiate with the British minister, and, if that were insufficient, the Shah should take the matter himself.
the 9th of September Mahomed Shah had “mounted his horse" and gone from before the walls of the beleaguered city. The siege of Herat, which lasted for nearly ten months, was the great event in the reign of Mahomed Shah. The British expedition in such circumstances was, therefore, with special reference to the consequences, involves a question foreign to the present narrative.

The remainder of the king's reign was marked by new difficulties with the British government; the rebellion of Aga Khan Mahlati having been followed by the abdication of the Shaker Khan of Turkey; the banishment of the asafu'd-daula, governor of Khorasan, followed by the insurrection and defeat of his son; and the rise of Babisim (q.v.). The first of these only calls for any detailed account. In the case of the British Government it was inclined to accept the cession by Persia of places such as Fars and Susa, which had been taken during the war from the Afghans, as well as for the violence offered to the courier of the consul. The period was soon after, when the Count de Paris was assassinated.

Difficulties with England.

On the 7th of August 1848, a British mission arrived at Teheran from London, under Sir John (afterwards Sir John) M'Neill, to renew diplomatic relations. It was most cordially received by the shah, and as one of its immediate results, Khorasan was evacuated by the British-Indian troops.

There had been a long diplomatic correspondence in Europe on the proceedings of Count Simonich and other Russian officers at Herat. Among the papers is a very important letter from Count Nesselrode to Count Pozzo di Borgo in which Russia declares herself to be satisfied with the result of the mission, and that the shah had been repudiated by him, because she found "justice on the side of England" and "wrong on the side of Persia." She withdrew her agent from Kandahar and would "not have with the Afghans any relations but those of commerce, and the government prolonged its stay.

Aga Khan's rebellion was fostered by the defection of a large portion of the force sent against him; but he yielded at last to the local authorities of Kerman and fled the province and country. He afterwards resided many years in Persia, where, while maintaining among his people a quasi-sectarian spirit, he was better known among Europeans for his doings on the turf.

The quarrel with Turkey was generally about frontier relations. Execution was demanded for the various specimens of which Colonel Williams (afterwards Sir Penwicks of Kars) was present. A massacre of Persians at Kerbela might have seriously complicated the dispute; but, after a first burst of hatred, the two governments came to an understanding, and the shah and the Sultan declared that the Massacre was an act of irresponsible ferocity. The outbreak of the Crimean War and the conclusion of the treaty of Erzerum, in which the shah agreed to withdraw his troops from the frontier of Turkey, was the chief cause of the acts of aggression by the shah, with the exception of his attempted invasion of Erzerum in 1847. The arrival of the Czar of Russia and his equipment of Russian troops in Erzerum were the chief cause of the outbreak of the war, which was followed by the defeat of the shah at the battle of Inkerman and the great disaster of the shah's army. The Treaty of Inkerman was signed on the 5th of December 1847, and the cession of Kars, Ardabil, and Erzerum was concluded. The shah was forced to yield to the demands of the Powers, and the war ended on the 29th of May 1856, when a peace of San Stefano was signed between the Powers and the shah.

The queen-mother, as president of the council, showed much judgment and capacity in conciliating adverse parties. But the six or seven weeks which passed between the death of the one and the coronation of the other proved a disturbed interval, and full recognition was not obtained until the end of February. The shah himself was made a member of the British government, and the representative of Russia, to secure the young prince's accession.

[1844–1901]

Rupture with England.

Anglo-Iranian Telegraph Line

Champain, officers of engineers, in 1862, and an agreement made on the subject concluded by Edward Eastwick, on behalf of Sir John Bowring, in 1865, by which a second line of that date was opened. A year later a more formal convention, including a second wire, was signed by the British envoy Charles Alison and the Persian foreign minister; meantime the work had been actively carried on, and completed in 1869. The line ran from Bushire and the Makran coast by cable, and on the other between Bushire and Bagdad via Teheran. The unworthy character of the line through Asiatic Turkey caused a subsequent change of direction; it followed the Caspian Sea, the Gulf of Khorneh, the river Oxus, and the Khyber Passes. The line was opened in 1873, and has worked ever since 1872, in conjunction with the Persian land telegraph system and the Bushire-Karachi line.

The Seistan mission, under Major-General (afterwards Sir Frederick) Goldsmid, left England in August 1870, and reached Teheran on the 3rd of October. Thence it proceeded to Isfahan, from which city it moved to Baluchistan, instead of seeking its original destination. After having been between the parallel of 30° N, it was taken to arbitration and owing to the disorderly state of Afghanistan, and it was therefore deemed advisable to commence operations by settling a frontier dispute between Persia and the Kalat state. Under this pretence the mission was received at the capital by the Persian commissioner, the untoward appearance at Bampur of an unexpected body of Kalatis, and the absence of definite instructions marred the fulfilment of the programme sketched to the mission by the British government. The mission afterwards accepted by the litigants. In the following year the same mission, accompanied by the same Persian commissioner, proceeded to Seistan, where it remained for more than five weeks, prosecuting its inquiries, until joined by another mission from India, under Major-General (afterwards Sir Richard) Pollock, accompanying the Afghan commissioner. Complications then ensued by the determined refusal of the two native officials to meet in conference; and the arbitrator had no course available but to take advantage of the notes already obtained on the spot, and return with them to Teheran, there to deliver his decision. This was in 1873, and the following year the Afghan telegraphic communication between East and West of Persia was closed by thequieta emic of M. Mecacheh, the Afghan minister in London, who died in 1874, when the British troops were persisting in the pass, or otherwise in the midst of dangers, caused Kamar to be suffocated in his prison. Since that event he had himself reigned supreme in Herat, and, dying in 1831, was succeeded by his son and by Mahomed. The chief soon entered upon a series of intrigues in the north and, among other acts offensive to Great Britain, suffered the Abbas Kull, who had, under guise of friendship, betrayed to his interest, and, among other acts offensive to Great Britain, suffered the Abbas Kull, who had, under guise of friendship, betrayed the cause of the salar at Meshed, to occupy the citadel of Herat, and again in 1879, the chief declared against the British of the channel. He was deposed by his son, who declared the shell renounced, and obtained a new engagement of non-interference with Herat from the Persian government, as well as the recall of Abbas Kull. In September 1885 Mahomed Yusuf, Sattouf, the envoy of Persia, sought a conciliation with some of his followers who were supposed accomplices in the murder of his uncle Kamran. About this time Dakhil Khan, one of the chief of Kandahar, died, and Dost Mahomed of Kabul ascended the throne. The British government, the British envoy, being determined to establish the last line of communications with the north, had made their escape to Teheran, and the shah, listening to their complaint, directed the prince-governor of Meshed to march to the eastern frontier and occupy Herat, declaring that an invasion of the province was imminent. The Persian government then made peace with Great Britain on the 18th of November 1856 war against Persia was declared.

In less than three weeks after its issue by proclamation of the governor-general of India, the Sind division of the field force left Karachi, and, after a few days' stay at Jashai, the British officers of the post ordered orders of engagement were declared. The engagement was fought at Khushabad on the road to Shiraz and the operations at Mahamah and the Karun River decided the campaign in favour of England. On the 5th of April, at Mahamah, Sir Colin Campbell was killed, and, on the 1st of May, the general's arrival on the road to Teheran and the engagement at Khushabad in two places on the road to Shiraz and the General Sir James Outram. Before the general arrived the island of Kharak and port of Bushire had been occupied, and the town of Bushire had been bombarded and captured, and the general's arrival the march upon Bazarjan and the engagement at Khushabad two places on the road to Shiraz and the operations at Mahamah and the Karun River decided the campaign in favour of England. On the 5th of April, at Mahamah, Sir Colin Campbell was killed, and, on the 1st of May, the general's arrival the march upon Bazarjan and the engagement at Khushabad—two places on the road to Shiraz—and the operations at Mahamah and the Karun River decided the campaign in favour of England. The Control of the Persian Gulf.}

E.—Persia from 1884 to 1901.

In 1865 the Shah had mooted the idea of a Persian naval flotilla in the Persian Gulf, to consist of two or three steamers named by Arabs and commanded by English naval officers, but the scheme foundered on the unwillingness of the British government, to whom it was known that the new project really concealed aggressive designs upon the independence of the islands and pearl fisheries of Bahrein (Curzon, PERSIA, ii. 294). Fifteen or sixteen years later it was repeatedly pointed out to the authorities that the revenues from the customs of the Persian Gulf would be much increased if control were exercised at all the ports, particularly the small ones where smuggling was being carried on on a large scale, and in 1883 the shah decided upon the acquisition of four or five steamers, one to be purchased yearly, and instructed the late 'Ali Kull Khan, Mukhber ad-daulah, minister of telegraphs, to obtain designs and estimates from British and German firms. The tender of a well-known German firm at Bremerhaven was finally accepted, and one of the minister's sons then residing in Berlin made the necessary contracts for the first steamer. Sir Donald Thomson, the British representative in Persia, having been instructed by the government to consider the advantages to Persia of opening the Karun River and connecting with Teheran by a carriageable road, a small river steamer for controlling the shipping on the Karun was ordered as well, and the construction of the road was decided upon. Two steamers, the "Susa" and the "Persepolis," were completed in January 1885; at a cost of £32,000, and despatched with German officers and crew to the Persian Gulf. When the steamers were ready to do the work they had been intended for, the farmer, or farmers, of the Gulf customs raised difficulties and objected to pay the cost of maintaining the "Persepolis"; the governor of Maharam would not allow any interference with what he considered his hereditary rights of the shipping monopoly on the Karun, and the objects for which the steamers had been brought were not attained. The "Persepolis" remained idle at Bushire, and the "Susa" was tied up in the Falsichirej, near Maharam. The scheme of opening the Karun and of constructing a carriageable road from Ahvaz to Teheran, was also abandoned.

Frequent interruptions occurred on the telegraph line between Tehran and Meshed in 1886, at the time of the "Panjeh incident," when the Russians were advancing towards Afghanistan and Sir Peter Lunsden was on the Afghan frontier; and Sir Donald Thomson concluded an agreement with the Persian government for the line between Tehran and Meshed. An agreement was signed by the British government paying a share not exceeding 20,000 rupees per annum of the cost of maintenance, and an English signaller being stationed at Meshed. Shortly afterwards Sir Donald Thomson left Persia (he died on the 15th of November 1888), and Arthur (afterwards Sir John) Thomson, the latter's twin brother, who had succeeded to the latter's tenure of office an agreement was concluded between the Persian and British governments regarding the Persian telegraph settlement at Jask, and the telegraph conventions of 1868 and 1872 were replaced by a new treaty on 1st February 1889, in which the British government guaranteed to pay to the Diet of the German Empire from 1897, from 1st January 1897, and from 1st of August 1897, for a futile attempt to enter Afghan territory and raise a revolt
against the Amir Abdur Rahman, he gave himself up to the British consul-general at Meshed in the beginning of November, and was sent under escort to the Turkish frontier and thence via Bagdad to London. In July Khan Muzah-had-daulah, the Persian minister for foreign affairs (died 1868), who was supposed to have gone to Ayub Khan's escape in order to please his Russian friends, was dismissed from office.

In December 1887 Sir Henry Drummond Wolff was appointed minister to Persia. The appointment was not very pleasing to the court, and the shah lent a willing ear to his advocacy for the development of trade and commerce, construction of roads, abolition of various restrictions hampering Persian merchants, &c. The shah also made generous grants to promote the expenditure towards freedom of life and property to all his subjects, and (October) declared the Karun river open to international navigation up to Ahvaz. At about the same time he appointed Amin-es-Sultan, with 10,000 rupees a year, (Minister for Foreign Affairs). In the same year (June 25) the first state loan in Persia to the value of £55,000 (5% ann.) was placed, and in the same year the Russian government, leaving 5 miles from Teheran to Shah-abdul-Aziz, was opened under the auspices of a Belgian company. A few months later (Jan. 30, 1888) Baron Julius de Reuter, in consideration of giving up the proceeds of the Russian bond as the owner of a concession for the formation of a Persian State Bank, with exclusive rights of issuing bank-notes and working the mines of copper, lead, mercury, coal, petroleum, manganese, borax, and asbestos, and besides insisting upon the shah considering a corresponding advantage; and Prince Dolgoruky, the Russian minister, obtained in February 1889 a document from the shah which gave to Russia the right to any railway concession in Persia where the railways would take the British Imperial Bank was established by British royal charter, dated the 2nd of September 1888, and started business in Persia (Oct. 23) as the "Imperial Bank of Persia." The railway agreement with Russia was changed in November 1890 into one interdicting all railways whatsoever in Persia.

In April 1889 the shah set out upon his third voyage to Europe. After a visit to the principal courts, including a stay of a month in London, where he was accompanied by Sir Henry Drummond Wolff, he returned to Persia soon afterwards, and in March of the following year the Persian government gave up another important concession, that of a tobacco monopoly, to British capital before returning back to the British minister to leave Persia. It was during his stay in England that the shah, for two or three days without his grand vizier, who was now absent on the death of his brother, listened to bad advice and granted a concession to a German company from the Persian subject. The latter ceded the concession to a British syndicate for £40,000. Very soon afterwards the shah was made aware of the evil results of this monopoly, and withdrew the concession, but it was too late for him to obtain compensation for it.

This unfortunate affair had the effect of greatly discrediting the shah in the eyes of the British and the European publics. In July 1889 he entered into an agreement with the London Stock Exchange for a long time. The concession for the tobacco monopoly was taken up by the Imperial Tobacco Company (copper). The same company and was transferred in the end of August 1889 the Persian government withdrew the concession and agreed to pay an indemnity of £500,000 (April 5, 1892). In order to pay the indemnity to the British Tobacco Company, the Persian government had to borrow 6% loan of £500,000 from the Imperial Bank of Persia, which had been compounding the proceeds of the Russian 5% loan of that year. (For details of the tobacco concession and an account of the events which led to its grant, see Sir J. Lortz, La Persia economia, 1900, pp. 164-169; and Dr F. Legrand, Les russes a la cour de Perse, Paris, 1889, ch. v., the latter ascribing the failure of the tobacco monopoly to Russian intrigue.)

In 1891 Sir Malcolm Khan Nizam-ul-Mulk, who had been Persian representative to the court of Great Britain since 1871, was recalled, and Mirza Mahomed 'Ali Khan, who was general at Tiflis, was appointed in his stead, arriving in London the following March. In 1890 the scheme of a carriageable road from Teheran to Teheran to Tabriz was abandoned. The Imperial Bank of Persia obtained a concession, and work of construction was carried out in the same year, and continued until 1893. In this year, too, the mining rights of the Imperial Bank of Persia were ceded to the Persia Mining Company, and a number of engineers who had worked in Indian mines were sent out to Persia. The total output of coal and coke, the high rates of transport, and the scarcity of coal and various mineral districts were made profitable operations impossible. The mines were liquidated in 1894, after having expended a large sum of money.

Great excitement was caused in the summer of 1891 by the report that an English girl, Kate Greenfield, had been forcibly carried away from her mother's house at Tabriz by a Kurd. The British authorities demanded the immediate restitution from the Persian government, the Kurd (a Turkish subject), refused to give up the girl, and took her to Saubalagh. The Turkish authorities protected him, and serious complications were avoided but finally an interview between the girl and the British agent was arranged, and the matter was promptly settled by her declaring that she had left her mother's house of her own accord, and was the wife of the Kurd. It is also became known that she was the daughter of a British-protected Hungarian named Grünfeld, who had died some years since, and the Persian lady of Tabriz.

Sir Frank Lascelles, who had been appointed minister to Persia in July, arrived at Teheran in the late autumn of 1891. In the following year Persia had a visitation of cholera. In Teheran and surrounding villages the number of fatal cases exceeded 28,000, or one in every sixteen inhabitants of Teheran. The epidemic appeared again, but in a milder form. In June 1893 Persia allowed the small but very fertile and strategically important district of Firuz and the adjacent lands between Baba Durnaz and Lutfabad to Khorasan (Khorasan) and received in exchange the important village of Hisarpur (Jezzine), near Abassabad on the frontier of Azerbaijan, which had become Russian territory in 1828, according to the Treaty of Turkmanchai.

In December 1891 Persia in the early part of 1894, and was succeeded by Sir Montgomerie Dunlop, who was appointed in July and arrived in Teheran in November. In the following year the shah, by a firman dated the 12th of May, gave the exclusive right of exploring ancient sites in Persia to the British government, with the stipulation that one-half of the discovered antiquities, excepting those of gold and silver and precious stones, should belong to the French government, which also had the preferential right by virtue of the treaty. Most of the other antiquities which the Persian government might dispose of to great powers.

In 1897 M. J. de Morgan, who had been on a scientific mission in Persia some years before and later in England, was appointed chief of the commission to engrave the Persian coins which were taken at Susa in December.

On the 1st of May 1896 Nomad d'Indrieu embarked while paying his devotions at the holy shrine of Shah-abad-Azim. Five days later he would have entered the fifteenth (lunar) one of his reign, and great preparations for duly celebrating the jubilee to his majesty and the country. The assassin was a small tradesman of Kermán named Mirza Reza, who had resided a short time in Constantinople and there acquired revolutionary and anarchist ideas from Kemal-d'Indrieu, and then fled to Teheran, visited London, and finally took up his residence in Constantinople. Kemal-d'Indrieu was a member of Hamadan and a tall man, and as the assassin repeatedly stated that he was the shah's emissary and had been acted by his orders, the Persian government demanded the extradition of Kemal from the Porte; but during the protracted negotiations the shah was died on the 12th of August 1896. There were few troubles in the country when the news of the shah's death became known. Serious rioting arose only in Shiraz and Fars, where some persons were killed and a number of caravans were loot. European firms who had lost guarantees and indemnities were indemnified by the Persian government. The new shah, Muzaffar-d'Indrieu (born March 25, 1853), then governor-general of Azerbaijan, who was in Tabriz, was enthroned there on the day of his father's death. In the process of renewal of the British and Russian consuls to Teheran, where he arrived on the 8th of June.

An excessive copper coinage during the past three or four years had caused much distress among the poorer classes since the beginning of the year, and the small trade was paralysed. Immediately after his accession the shah decreed that the coinage of copper money should be suspended, and that the coinage be withdrawn from circulation. In order to reduce the price of copper moneys which had existed since ancient times was abolished. The Imperial Bank of Persia, which had already advanced a large sum of money, had been troubled by the early departure from Tabriz and enabled the government to have recourse to the government, started buying up the copper coinage at all its branches and agencies. The nominal value of the copper money was 20 to 1 kran, but in some places the copper money circulated at the rate of 8 shahs to the kran. It was evident that at the same price, and the average circulating value in all Persia was over 40. If government had been able to buy up the excess at 40 and reissue it at 20, it would have lost half its value; and the people required it, the loss would have been small. But although the prices of copper money from place to place had been strictly prohibited dishonest officials found means to traffic in copper money on their own account, and the prices varied from one town to another; it was cheap and forwarding it to cities where it was dear, the bank bought it and thus rendering the arrangement for a speedy withdrawal of the excess at small cost to government futile. It was only in 1890 that the distress caused by the excessive copper coinage ceased, and then only at very great loss to government. The well-intentioned abolition of the tax on meat also had not the desired result, by a system of "cornering" the price of meat rose to more than it was before.
In the autumn of 1896 the grand vizier (Amin-es-Sultan) encountered much hostility from some members of the shah's entourage and various high personages. Amin-ad-daulah was appointed chief administrator (vizier) of the customs department in March 1897. But he found it impossible to carry on his work, resigned, and retired to Kurn (Nov.) 24, and the shah formed a cabinet composed for the greater part of the leading members of the opposition to the grand vizier. Later months of the year saw a new regime under a new cabinet, under the minister of the interior. The governor-general of Kerman was despatched to Baluchistan. The port of Fannoo was taken in March 1898, and order was restored. One of the murderers was hanged at Jask (May 31).

Nasru'd-Din, who had been minister of finance (Feb.), and made some attempt to reform the customs department, was dismissed; and in August Muhsin Khan, who had been grand vizier, was dismissed. The minister of customs was offered to Nasru'd-Din, who refused it. The minister of finance was then dismissed. The minister of the interior was dismissed, and the ministry of the interior was disorganized. The shah accordingly appointed amin-ad-daulah to Teheran (Feb.), and appointed him minister president (raisi-l-vuzara) and minister of the interior. In June Amin-ad-daulah was made prime minister (vizir 'azim) and given more extended powers, and in August raised to the dignity of grand vizier (sadat 'azim). Nasru'l-Mulk was appointed minister of finance (Feb.), and made some attempt to reform the customs department, by a new budget, reorganize the revenue department, made a new assessment of the land-tax, &c.; but resistance on the part of the officials rendered it abortive.

Abdol Azim Shah's tenure of office was considered to be absolutely necessary in the following year, but with the sole result of discrediting the Persian government in Europe. In the beginning of 1898 the shah's medical advisers strongly recommended his removing himself to Europe for a complete change of climate. He accordingly left Teheran (July 14) for St. Petersburg, and thence to Paris (July 29), intending to go to London on the 9th of August. But on account of the prevailing sickness in which several courts were thrown through the death of the king of Italy (July 29) and the death of Saxe-Coburg-Gotha (July 30), the visits to England, Germany and Italy were abandoned. On the 2nd of August an anarchist made an attempt upon the shah's life in Paris.

Abdul Azim Shah was received with a great deal of popular enthusiasm, and was received with a great deal of popular enthusiasm, and was received with a great deal of popular enthusiasm, and was received with a great deal of popular enthusiasm, and a great deal of popular enthusiasm.

In 1898 the Shah's government was considered to be absolutely necessary in the following year, but with the sole result of discrediting the Persian government in Europe. In the beginning of 1898 the shah's medical advisers strongly recommended his removing himself to Europe for a complete change of climate. F. - Russo-British Rivalry (1902-1907) and the Persian Revolution (1906-1909).

In 1902 Muzaffar-ad-Din Shah revisited the principal European capitals, and was received by King Edward VII, at Portsmouth in August. A mission headed by Viscount Downe was afterwards despatched to Persia, to invest the shah with the order of the Garter, a ceremony which took place in Teheran on the 2nd of February 1903. A week later, a new commercial treaty was concluded between Great Britain and Persia, which instituted various reforms in the customs service, secured to both countries the "most-favoured-nation" treatment, and substituted specific import and export duties for the charge of 5% ad valorem provided for in the treaty of 1857. These provisions to some extent counterbalanced the losses inflicted on British trade by the Russo-Persian commercial treaty signed in 1903, which had seriously damaged the Indian tea trade, and had led to a rapid extension of Russian influence. Between 1899 and 1903 the Russian Bank had lent Persia £4,000,000, and had secured about three-quarters of the life of the shah for his personal requirements. Russian concessionaires were given the right to build roads from Tabriz to Teheran (1902) and from Tabriz to Kazvin (1903); and the Russian Bank opened new branches in Seistan — an example followed in 1903 by the Bank of Persia. It was, however, in the Persian Gulf that the rivalry between Great Britain and Russia threatened to become dangerous. Great Britain had almost a monopoly of maritime commerce in the Gulf, and was alone responsible for buoying, lighting and policing its waters. The British claim to political supremacy in this region had thus a solid economic basis; it had been emphasized by the British action at Kuwait (q.v.) in 1899, and by the declaration made in the House of Lords by Lord Lansdowne, as secretary of state for foreign affairs, to the effect that Great Britain would resist by all means in its power the attempt of any other nation to establish itself in force on the shores of the Gulf. On the 16th of November 1903, Lord Curzon, the viceroys of India, sailed from Karachi for the Persian Gulf. His ship, the "Hardinge," had been specially adapted as a political demonstration, to be interpreted in connexion with Lord Lansdowne's declaration. At Bushire, on the 1st of December, the Persian governor of Fars, Ala ad-daula, committed a breach of diplomatic etiquette which induced Lord Curzon to sail away without landing. This incident was considered by some British observers to have been brought about by Russian intrigue, and the fact that Ala ad-daula was dismissed in 1904, after the Japanese had achieved several initial successes in the Russo-Japanese war, was held to confirm this opinion. But Russian financial and commercial influence in
Persia continued to increase; in December 1904 a special mission under Mirza Riza Khan was received in audience by the tsar; and in May 1905 Muzaffar-ud-Din Shah himself left Persia to visit the courts of Vienna and St Petersburg.

The Seistan Mission of 1902-1905.—A dispute as to the frontier between Afghanistan and Seistan arose in 1902. The boundary delimited by the Seistan mission of 1870-1872, and known as the "Goldsmid line," was drawn along the course of the river Helmund. Between 1872 and 1902 the Helmund took a more westerly direction; no boundary marks had been erected, and a wide strip of territory remained in dispute. The Persians claimed that the boundary was the old bed of the river, the Afghans that it was the new bed; and in accordance with the treaty of 1857 both parties asked the British government to arbitrate. In January 1903, Colonel Arthur Henry MacMahon, who had previously delimited the frontier between Afghanistan and British India, was despatched from Quetta. The Persian officials were at first hostile, but their opposition, which was attributed to Russian influence at Teherán, was eventually overcome, and Colonel MacMahon (who was knighted in 1906) delivered his final award, sustaining the Persian contention, in February 1905.

British Commercial Missions.—Owing to the success of the Maclean mission, which visited and reported upon the markets and trade-routes of north-western Persia in 1903, under the direction of the Board of Trade, a similar mission was sent to southern Persia in 1904, under the auspices of the Upper India Chamber of Commerce, the Bengal Chamber and the Indian Tea Cess Company. The report of this mission (by Gledowe-Newcomen) was published in 1906. After showing that civilized government was practically non-existent in the regions visited, it suggested as the chief remedy the conclusion of a Russo-British convention, and the division of Persia into "spheres of influence."

The Russo-British Convention of 1907.—The political situation created by the Russo-Japanese War and by an internal crisis in Persia itself rendered possible such an agreement between the two rival powers, and a Russo-British convention was signed on the 31st of August 1907. Its chief provisions, in regard to Persia, are as follows: (1) north of a line drawn from Kars-i-Shirin, Isfahan, Yezd and Kakh to the junction of the Russian, Persian and Afghan frontiers Great Britain undertook to seek no political or commercial concession, and to refrain from opposing the acquisition of any such concession by Russia or Russian subjects; (2) Russia gave to Great Britain a like undertaking in respect of the territory south of a line extending from the Afghan frontier to Gagiz, Birjend, Kermán and Bander Abbas; (3) the territory between the lines above-mentioned was to be regarded as a neutral zone in which either country might obtain concessions; (4) all existing concessions in any part of Persia were to be respected; (5) should Persia fail to meet its liabilities in respect of loans contracted, before the signature of the convention, with the Persian Banque d'Escompte et de Prêts, or with the Imperial Bank of Persia, Great Britain and Russia reserved the right to assume control over the Persian revenues payable within their respective spheres of influence. With this convention was published a letter from the British secretary of state for foreign affairs (Sir E. Grey), stating (1) that the Persian Gulf lay outside the scope of the convention, (2) that Russia admitted the special interests of Great Britain in the Gulf, and (3) that these interests were to be maintained by Great Britain as before.

The Persian Constitution.—The misgovernment and disorder which were revealed to Europe by the Gledowe-Newcomen report, and by such sporadic outbreaks as the massacre of the Babis in Yezd (1903), had caused widespread discontent in Persia. In 1905, partly owing to the example shown by the revolutionary parties in Russia, this discontent took the form of a demand for representative institutions. On the 4th of August 1906, Muzaffar-ud-Din Shah issued a rescript in which he undertook to form a national council (Majlis) representing the whole people (see above, Constitution). The Majlis was duly elected, and was opened by the shah in person on the 7th of October 1906. In January 1907 the shah died, and was succeeded by his eldest son, Mahammed 'Ali Mirza, who on the 11th of February published a message to his people, pledging himself to adhere to the new constitution.

The Revolution.—On the 12th of November the shah visited the Majlis, and repeated his pledge, but during December a riot in Teherán developed into a political crisis, in which the shah's troops were employed against the civil population. The Majlis issued a manifesto to the powers, declaring that the shah intended to overthrow the constitution, and demanding intervention. The Russian and British ministers in Teherán urged Mahammed 'Ali to maintain the constitution, and he sent a message to the Majlis, promising compliance with its demands and agreeing to place the whole army under the control of the ministry of war. These concessions allayed the prevailing unrest for a time, but the Royalist and Nationalist parties continued secretly to intrigue against one another, and in February 1908, while the shah was driving in Teherán, two bombs were exploded under his motor-car. Two persons were killed, but the shah was unhurt, and the Majlis formally congratulated him on his escape. A prolonged ministerial crisis, in April and May, was attributed by the Nationalists to the influence of reactionary courtiers, and by the Royalists to the influence of the Anjumans, or political clubs, which were alleged to control the Nationalist majority in the Majlis. Early in June the Majlis urged the shah to dismiss the courtiers under suspicion. Mahammed 'Ali consented, but withdrew from Teherán; and on his departure the royal bodyguard of so-called "Cossacks"—Persian soldiers officered by Russians in the shah's service—at once came into conflict with the Nationalists. The house of parliament was bombarded, and when the Majlis appointed commissioners to discuss terms, the shah issued a manifesto dissolving the Majlis, and entrusted the resumption of order in Teherán to the royal bodyguard. He proposed to select for the election of a Majlis a council of forty members, nominated by himself; but under pressure from Great Britain and Russia he promised to abandon this scheme and to order another general election. Meanwhile, civil war had broken out in the provinces; Kurdish raiders had sacked many villages near Tabriz; Persian brigands had attacked the Russian frontier-guards on the borders of Transcaucasia, and the indemnity demanded by the tsar's government was not paid until several Persian villages had been burned by Russian troops. This incident, combined with the employment of the so-called Cossacks, evoked a protest from the Nationalists, who asserted that Russia was aiding the Royalists; the accusation was true only in so far as it referred to the conduct of certain Russian officials who acted without the consent of the Russian government. Early in 1909, indeed, a Russian force of 2600 men was sent to watch events near Tabriz, and if necessary to intervene in favour of the Nationalists, who held the town, and had for some months been besieged by the shah's troops. The presence of the Russians ultimately induced the Royalists to abandon the siege. In January of the same year the revolution spread to Isfahan, where the Bahkhtiari chiefs made common cause with the Nationalists, deposed the Royalist governor and marched on the capital. In May and June the shah issued proclamations declaring his fidelity to the constitution, and promising an amnesty to all political offenders; but he was powerless to stay the advance of the combined Bahkhtiari and Nationalist troops, who entered Teherán on the 13th of July. After severe street fighting the Cossacks deserted to the rebels, and the shah took refuge in the Russian legation (July 15). This was interpreted as an act of abdication; on the same day the national council met, and chose Mahammed 'Ali's son, Sultan Ahmad Mirza, aged thirteen, as his successor. Assad ul-Mulk, head of the Kajar tribe, was appointed regent. On the 9th of September 1909, the ex-shah departed for his place of exile in the Crimea, escorted by Russian Cossacks and Indian savars. On the 22nd of November the newly elected Majlis was formally opened by the shah.
The language of the other parts of the Avesta is more modern, but not all of one date, so that we can follow the gradual decline of Zend in the context of the Avesta. The earliest date of a text, the simpler the grammar, the more lexically and phonologically we have no chronological points by which to fix the date when Zend ceased to be a living language; no part of the Avesta can be placed before the 6th century B.C. Before Alexander's time it is said to have been written out on dressed cowides and preserved in the state archives at Persepolis.

The following of Zarathustra soon ceased to understand Zend. For the first time, Zend, a language that had spared the Avesta, was translated into Middle Persian by a member of the Sassanian dynasty. This translation, though still regarded as canonical by the Parsees, is a very imperfect knowledge of the original language. Its value for modern philology has been the subject of much needlessly controversial argument. It is not only a secondary means towards the comprehension of the ancient texts, but it can become a basis of mutual understanding. A logical system of comparative exegesis, aided by constant reference to Sanskrit, its nearest ally, and to the other Indian languages, is the best means of recovering the lost sense of the Zend texts.

The phonetic system of Zend consists of simple signs which express the different shades of sound in the language with great precision. In the vowel-system a notable feature is the presence of the short vowel *a*, which is not found in Sanskrit and Old Persian; thus the Sanskrit *sāh* and Old Persian *səh* are not identical. In the system *heni* in Zend. The use of the vowels is complicated by a tendency to combinations of vowels and to eophthegmy, i.e., the transposition of weak vowels into the next syllable; e.g., Sanskrit *bharati*, Zend *bărati* (he carries); Old Persian *mōra* (Merv); Sanskrit *rañāti*, Zend *ranākiti*. Thriptihons are not uncommon; e.g., Sanskrit *aśrāyhat* (dative plural of *aśra*, a horse) is Zend *āštrāyhat*; Sanskrit *kənəti* (he does), Zend *kənəna*. Zend has also a great number of compound stems, especially near liquids; owing to this the words seem rather inflected; e.g., *sən* (on the left) becomes in Zend *hāsəna*; *bhrjāt* (it glitters), Zend *bhrəjāt*; *pəz* (yow), Zend *pəzn*.

In the consonantal system we are able to distinguish a number of stems, such as *s* and *š* in three forms of modification, *s* and *š*, and nasals (five in number), and by the complete absence of *l*. A characteristic phonetic change is that of *t* into *š*: e.g., Zend *asha* for Sanskrit *tā*, Old Persian *arta* (in Avesta); *frəz* for Pahlavi *frawār*, New Persian *fere* (the spirits of the dead). The Zend texts offer material for the reconstruction of the original forms with Sanskrit, but the conjugation by principle is only slightly developed. The noun has the same eight cases as in Sanskrit; in the gāthās there is a special ablative, limited, as in Sanskrit, to the first person plural. In later Zend the ablative is extended to all the stems indiscriminately.

We do not know in what character Zend was written before the time of Alexander. From the Sassanian period we find an alphabet of the same character in use, derived from the Parthian, which is closely related to the language of inscriptions in books. The oldest known manuscripts are of the 4th century A.D. 2

Although the existence of the Zend language was known to the Oxford scholar Thomas Hyde, the Frenchman Arquetip Duperron, and the Englishman F. Justus, a dictionary of Zend was published in 1784. The works of this century and the next, as in the case of Sanskrit, have been collected in the Avesta. The second and third centuries are the period in which the Zend texts were written.

Scientific study of Zend texts began with E. Burnouf, and has since then made rapid strides, especially since the Vedas have opened up a new knowledge of the oldest Sanskrit.

2. Old Persian.—This work, however, the ancient Persians properly so-called, in all probability the mother-tongue of Middle Persian of the Pahlavi texts, and of New Persian. The Old Persian is a highly complicated language, and the language of the Vedas has a close resemblance, exceeding that of any two Romance languages; they seem hardly of the same origin. Whole strophes of gāthās can be turned into good Old Sanskrit by the application of certain phonetic laws; for example—

"mat vao padasīh yā frasrātīh izhaiyānī
paarjāsāh māzdā uttanā hastast
at vān āhā arēdhāyāc nemāṅgā
at vōngān̄guhā manān̄guhunārattāt,"

becomes in Sanskrit—

"mana vah padāhī yā pracrūtāh izhāyānī
parjāsāh medhā uttanā hastast
at vān āhā arēdhāyāc nemāṅgā
at vōngān̄guhā manān̄guhunārattāt,"

since their introduction into Sanskrit by the application of certain phonetic laws.

1 With verses of my making, which are now heard, and with prayerful words, I come before thee, Mazda, and with the sincere humility of the upright man and with the believer's song of praise.

2 Grammar of Sanskrit (Oxford, 1881); Dictionary of F. Justi (Leipzig, 1864); editions of the Avesta by F. L. Westergaard (Copenhagen, 1865) and C. F. Geldner (Stuttgart, 1886–1890; also in English); translation into German by Spiegel (Leipzig, 1852), and into English by Darmesteter (Oxford, 1890) in Max Müller's Sacred Books of the East.
1. Language and Literature

I. Persian (Iranian) Languages.—Under the name of Persian is included the whole of that great family of languages occupying a field nearly coincident with the modern Iran, of which true Persian is simply the western division. It is therefore common and more correct to speak of the Iranian family. The original native name for this race which spoke these tongues was Aryan. King Darius is called on an inscription "a Persian, son of a Persian, an Aryan of Aryan race"; and the followers of the Zoroastrian religion in their earliest records never give themselves any other title but Airyavā dānghāta, that is to say, "Aryan races." The province of the Iranian language is bounded on the west by the Semitic, on the north and east north by the Ural-Altaic or Turanian, and on the south-east by the kindred language of India.

The Iranian languages form one of the great branches of the Indo-European stem, first recognized as such by Sir William Jones and Friedrich Schlegel. The Indo-European or Indo-Germanic languages are divided by Brugmann into (a) Aryan, with sub-branches (a) Indian, (b) Iranian; (2) Armenian; (3) Greek; (4) Albanian; (5) Italic; (6) Celtic; (7) Germanic, with sub-branches (a) Gothic, (b) Scandinavian, (c) West Germanic; and (8) Balto-Slavonic. (See Indo-Europe.) The Aryan family (called by Professor Sievers the "Asiatic base-language") is subdivided into (1) Iranian (Eranian, or Eroano-Aryan) languages, (2) Piscara, or non-Sanskrit Indian-Aryan languages, (3) Indo-Aryan, or Sanskrit Indo-Aryan languages (for the last two see Indo-Aryan; Iranian being also grouped into Persian and non-Persian).

The common characteristics of all Iranian languages, which distinguish them especially from Sanskrit, are as follows:—

1. Changes of the original ś into the spirant h. Thus—

4. New Persian.—The last step in the development of the language is New Persian, represented in its oldest form by Firdousi.

New Persian.

In grammatical forms it is still poorer than Middle Persian; except English, no Indo-European language has been made up, and almost no difference between Syriac and Romance has been maintained in Old or New Persian.

The structure of New Persian has hardly altered at all since the Shahnama; but the original purity of Firdousi, who made every effort to keep the language free from Semitic admixture, could not long be maintained. Arabic literature and speech exercised a powerful influence on New Persian, and especially on the written language, which it could not withstand the admission of an immense number of Semitic words. There is no word which would be refused acceptance in good Persian. But, nevertheless, New Persian has remained a language of genuine Iranian stock.

Among the changes of the sound system in New Persian, as contrasted with that of Old Persian, the chief are those to which we refer in the first place. It is a curious coincidence that the change in the tenses k, l, p, c into d, b, s is thus we have—

mahdā (death) mark mark
Thraethona Fruñ Fruđin
āp (water) āp āb
hätvāt (self) khot khōd
rauch (day) rōj rōz
haca aj až.

A series of consonants often disappear in the sprint; thus—

Old Persian or Zend: Pahlavi. New Persian.

kaaf (mountain) koř koř
gāthu (place), Z. gāt gāh
kadhā (slave) bandak bandah
spār (army) spāh
dadāmī (I give) dīham.

Old d and dā frequently become y—

Old Persian or Zend: Pahlavi. New Persian.

madōh (wine) māi
baelādoh (consciousness) bōi bōi
pākhtā (foot) bāi
kadhā (when) bāi.

Old y often appears as j: Zend yāmā (glass), New Persian jām: yāvan (a youth), New Persian jāvan.

Two consonants are not allowed to stand together at the beginning of a word; hence vowels are frequently inserted or prefixed, e.g. New Persian stūdān or tīdīdān (to stand), root sīd, (brother), Zend and Pahlavi bīdār.1

Amongst modern languages and dialects other than Persian which must be also assigned to the Iranian family may be mentioned:

Modern Dialects.

1. Kurdish, a language nearly akin to New Persian, with which it has important characteristics in common. It is chiefly distinguished from it by a marked tendency to shorten words, and a peculiarity of the first forms of the verb, which is represented in New Persian bīdār: Kurid. dim (I give) = New Persian diham; Kurid. sī (white) = New Persian sīdī.

2. Baluchi, the language of Baluchistan, also very closely akin to New Persian, but especially distinguished from it in that all the old sprints have been changed into explosives, e.g. Baluchi sab (sleep) = Zend sāvā; Baluchi ṭap (slime) = Zend ṭa; New Persian ṭāf; Baluchi ṭap (seven) = New Persian ṭaf.

3. Ossetic, the Iranian, in spite of its resemblance in sound to the Georgic.2

4. Pashtu (less accurately Afghan), which has certainly been increasingly influenced by the neighbouring Indian languages, is infusion, syntax and vocabulary, but is still at bottom a pure Iranian language, not merely intermediate between Iranian and Indian.

The position of Armenian remains doubtful. Some scholars assert that it is a separate and independent member of the Indo-European group. Many words that at first sight seem to prove its Iranian origin are only adopted from the Persian.3

(K. G.)

II. Modern Persian Literature.—Persian historians are greatly at variance about the origin of their national poetry. Most of them go back to the 5th Christian century and ascribe to one of the Sassanian kings, Bahram V. (420-439), the invention of the Persian language and literature.

2 F. F. Hübschmann, in Kuhn's Zeitschrift, xxxvi. 396.
3 G. F. P. de Lagarde, Aramische Studien (Leipzig, 1893).

metre and rhyme; others mention as author of the first Persian poem a certain Abulhaq of Soghd, near Samarkand. In point of fact, there is no doubt that the later Sassanian rulers fostered the literary spirit of their nation (see Pahlavi). Pahlavi books, however, fall outside of the present subject, which is the literature of the idiom which shaped itself out of the older Persian speech by slight modifications and a steadily increasing mixture of Arabic words and phrases in the 9th and 10th centuries of our era, and which in all essential respects has remained the same for the last thousand years. The death of Hārūn al-Rashīd in the beginning of the 9th century, which marks the commencement of the decline of the caliphate, was at the same time the starting-point of movements for national independence and a national literature in the Iranian dominion, and the common cradle of the two was in the province of Khorasan, between the Oxus and the Jaxartes. In Merv, a Khorasāni, Abū'l-Abbas, who composed in 899 A.D. (103 B.H.), according to the oldest biographical writer of Persian, Mahommed 'Aafi, the first real poem in modern Persian, in honour of the Abbasid prince Mamīn, Hārūn al-Rashīd's son, who had himself a strong predilection for Persian, his mother's native country, and was, moreover, thoroughly imbued with the freethinking spirit of his age. Soon after this, in 820 (205 A.H.), Tāhir, who aided Mamīn to wrest the caliphate from his brother Amīn, succeeded in establishing the first semi-independent Persian dynasty in Khorasan, which was overthrown in 872 (235 A.H.) by the Āfšārsīds.

The development of Persian poetry under these first native dynasties was slow. Arabic language and literature had gained too firm a footing to be supplanted at once by a new literary idiom still in its infancy; nevertheless the few poets who arose under the Šāhīids and Āfšārsīds show already the germs of the characteristic tendency of all later Persian literature, which aims at amalgamating the enforced spirit of Islamism with their own Aryan feelings, and reconciling the strict desim of the Mahomedan religion with their inborn loftier and more or less pantheistic ideas; and we can easily trace in the few fragmentary verses of men like Ḥanzala, Ḥākim Fīrūz and Abū Šalik those principal forms of poetry now used in common by all Mahomedan nations—the forms of the gāzīdā (the encomiastic, elegiac or satirical poem), the ghalas or ode (a love-ditty, wine-song or religious hymn), the rubāʾi or quatrains (our epigram, for which the Persians invented a new metre in addition to those adopted from the Arabs), and the mathnawī or double-rhymed poem (the legitimate form for epic and didactic poetry). The first who wrote such a mathnawī was Abū Shūkār of Bālkh, the oldest literary representative of the third dynasty of Khorasan, the Šāmānīs, who had been able in the course of time to dethrone the Āfšārsīds, and to secure the independence of Persia, nominally still under the supremacy of the caliphs in Bagdad, but in fact with full sovereignty. The undisputed reign of this family dates from the accession of Abū Naṣr Th. (913-942; 301-331 A.H.), who, more than any of his predecessors, patronized arts and sciences in his dominions. The most accomplished minstrels of his time were Mahommed Farālādī (or Farālāvī); Abū' l-'Abbās of Bokhārā, a writer of very tender verses; Abū l-'Muẓaffar Naṣr of Nishāpūr; Abū' l-'Abbas of Bokhārā, a great baker, poet and quack; Abū Shā'uīlā Sāliḥ of Herāt, who left a spirited little song in honour of a young Christian maiden; Ra'nāq of Bokhārā; Abū' l-Fāṭīma of Būst, who was also a good Arabic poet; the amīr Abū' l-Hāsan Alī Alagāčti, who handled the pen as skillfully as the sword; 'Umar of Merv, a famous...
astronomer; and Kisâl, a native of the same town, a man of stern and ascetic manners, who sang in melodious rhythm the praises of the sun and twelve imâmas. All these poets flourished under the patronage of the Sâmânid princes, who also fostered the growing desire of their nation for historical and antiquarian researches, for exegetical and medical studies. Maânûr I., the grandson of Râdû'â's patron, ordered (963; 352 A.H.) his vizîer Ba'llâmî to translate the famous universal history of Tabari (838-923 A.D.) from Arabic into Persian; and this

Tabârî, Tu'rîkh-i-Tabârî, the oldest prose work in modern Persian, is not merely remarkable from a philological point of view, it is also the classic model of an easy and simple style (French trans. by L. Dubex and H. Zotenber, 1867-1874). The same prince employed the most learned among the ulama of Transoxiana for a translation of Tabârî's second great work, the Ta'farî, or commentary on the Koran, and accepted the dedication of the first Persian book on medicine, a pharmacoepoia by the physician Aâbû Maânûr Muwallâq b. 'Ali of Herât (edited by Seligmânn, Vienna, 1859), which forms a kind of connecting link between Greek and Indian medicine. It was soon after further developed into the great Arabi-i-Qânûn (1177; 428 A.H.) by the son of the eunuch by birth and author of property wines, moral maxims, psychological treatises, and a manual of philosophic science, the Dânishhâma-i-Abâ'tî, in his native tongue.

A still greater impulse was given, both to the patriotic feelings and the national poetry of the Persians, by Maânûr's son and successor, Prince Nûn II., who ascended the throne in 976 (365 A.H.). Full of enthusiasm for the glorious past of the old Iranian kingdom, he charged his court poet Dâkîkhî (Daqîqi), who openly professed in his ghazals the Zoroastrian creed, to turn the Khodâ'înâmâ, or "Book of Kings," into Persian verse. Shortly after commencing this work Dâkîkhî was murdered in the prime of life; his death was soon followed by the fall of the Sâmânid dynasty itself. But Dâkîkhî's great enterprise was not abandoned; a stronger hand, a higher genius, was to continue and to complete it, and this genius was found in Firdousî (946-1020; 328-411 A.H.), with whom we enter the golden age of the national epic in Persia (see Firdousî). In 1017, after thirty-five years of unremitting labour, he accomplished his gigantic task, and wrote the last distichs of the immortal Shâhânâmâ, that "glorious monument of Eastern genius and learning," as Sir W. Jones calls it, "which, if ever it should be generally understood in its original language, will contest the merit of invention with Homer itself." The Shâhânâmâ, imitations of him, from the very moment of its appearance, exercised such an irresistible fascination upon all minds that there was soon a keen competition among the younger poets as to who should produce the most successful imitator of that classic model; and this competition has gone on under different forms through all the following centuries, even to the most recent times. First of all, the old popular traditions, so far as they had not yet been exhausted by Firdousî, were ransacked for new epic themes, and a regular cycle of national epotheses gathered round the Book of Kings, drawn almost exclusively from the archives of the princes of the family of Firdousî's greatest hero, Rustâm. The first and most ambitious of these competitors seems to have been Asâdî's own son, 'Ali b. Ahmad al-Asâdî, the author of the oldest Persian glossary, who completed in 1066 (458 A.H.), in upwards of 4000 distichs, the Garsâshânâmâ, or marvellous story of the warlike feats and love adventures of Garsâshâp, one of Rustâm's ancestors. The heroic deeds of Rustâm's grandfather were celebrated in the Sânâmâ, which almost equals the Shâhânâmâ in length; those of Rustâm's two sons, in the Jâhâgârânâmâ and the Farâmurzânâmâ; those of his daughter, an amazon, in the Brunhill style of the German Nibelunge, in the Bâsu Gawshânâmâ; those of his grandson in the Barsânâmâ, those of his great-grandson in the Shahrîrânâmâ (ascribed to Muhkâtî and dedicated to Mas'ûd Shâh, who is probably identical with Mas'ûd b. Ibrahim, Sultan Ma'nûr's great-grandson, 1090-1144; 492-506 A.H.); and the wonderful exploits of a son of Islândiyâr, another hero of the Shâhânâmâ, in the Bâhmanânâmâ.

When these old Iranian sources were almost exhausted, the difficulty was met in various ingenious ways. Where some slight historical records of the heroic age were still obtainable poetical imagination seized upon them at once; where no traditions at all were forthcoming fiction pure and simple asserted its right; and thus the national epohe gave way to the epic story, and—substituting prose for verse—to the novel and the fairy tale. Models of the former class are the various Iskandarnânâmâs, or " Books of Alexander the Great," the oldest and most original of which is that of Nizâmî of Ganja, the modern Elizavetpol (completed about 1202; 599 A.H.); the latter begins with the Kîdîb-i-Samâ'î, a novel in three volumes (about 1180; 585 A.H.), and reaches its climax in the Bâsânî-Khoydî, or "Garden of Imagination," a prose romance of fifteen large volumes, by Mahommed Taqî Khoydî, written between 1742 and 1756 (1155 and 1169 A.H.). Some writers, both in prose and verse, turned from the exhausted fields of the national glory of Persia, and chose subjects from the thirteenth centuries in the East or the conquerors, or even from the Jewish legends of the Koran. Of this description are the Anbiyânâmâ, or history of the pre-Mahomedan prophets, by 'Hasân Shabistârî 'Ayânî (before the 8th century of the Hegira); Ibn Rustâm's Khwârijnâmâ (1427; 830 A.H.), of the deeds of 'Ali; Bâdîbî's Hama-l-i-Ha'idârî, which was completed by Najâî (1723; 1135 A.H.), or the life of Shâh Hamiddî and the first four caliphs; Kâzîm's Farâbînâmâ-Fâtîmâ, the book of joy of Fâtimâ, Mahomet's daughter (1371; 1150 A.H.)—all four in the epic metre of the Shâhânâmâ; and the prose stories of Hâtim Tâ'î, the famous model of liberality and generosity in pre-Islamic times; of Amîr Hamshâ, the uncle of Mahomet; and of the Mu'îsîgî-t-Masâwî, or the miraculous deeds of Moses, by Mû'âlînîmîsî (died about 1501; 907 A.H.).

Quite a different turn was taken by the ambition of another class of imitators of Firdousî, especially during the last four centuries of the Hegira, who tried to create a new heroic epohe by celebrating in rhyme and rhythm the thrilling events of recent date. The gigantic figure of Timûr, who by his Timârnâmâ, the stormy epoch of the first Safavid rulers, who succeeded at last in reuniting for some time the various provinces of the old Persian realm into one great monarchy, furnished Kâsimî (died after 1560; 967 A.H.) with materials of his Shâhânâmâ, a poetical history of Shah Isma'il and Shâh Tahmâsp. Another Shâhânâmâ, celebrating Shah 'Abbâs the Great, was written by Kamâlî of Sabzevar; and even the cruelties of Nâdir Shâh were duly chronicled in a pompous epic style in 'Ishratî's Shâhânâmâ-i-'Nâdîrî (1749; 1162 A.H.). But all these poems are surpassed in length by the 33,000 distichs of the Shâhînâshânâmâ by the poet-laureate of Pâth 'Ali Shâh of Persia (1707-1834), and the 40,000 distichs of the Georganâmâ, a poetical history of India from its discovery by the Portuguese to the conquest of Poonâ by the English in 1817. In India this kind of epic versification has flourished since the beginning of Humâyûn's reign (1530-1560); e.g. the Zârfarânâmâ-i-Shâhjahânî by Khudâl (d. 1648; 1056 A.H.); the Shâhînâshânâmâ by Tâlib Kâlin (d. 1613; 1061 A.H.); another panegyrist of Shâh Jahân; Atâshî's A'dîlânâmâ, in honour of Shah Mahommed 'Adîl of Bijâpur, who ascended the throne in 1629 (1039 A.H.) or 1637; the Tâwûrirî-kuli 'Khulshâh, a metrical history of the Kutb shâhs of Golconda; and many more, down to the Fâthânamâ-i-Tûpû Sultan by Ghulâm 'Hasân (1784; 1198 A.H.).

But the national epohe was not the only bequest the great Firdousî left to his nation. This rich genius gave also the first impulse to romantic, didactic and mystic poetry; and even his own age produced powerful co-operators in these three most conspicuous departments of Persian literature.

Romantic Fiction, which achieved its highest triumph in Nizâmî of Ganja's (1141-1203; 553-590 A.H.) brilliant pictures of the struggles and passions in the human heart.

1 After 1572 (979 A.H.) according to H. E. in Grundriss, II. 327.
(see Nizami), sent forth its first tender shoots in the numerous love stories of the Shahnama, the most fascinating of which is that of Zal and Rudabeh, and developed almost into full bloom in Firdousi's second great mathnawi Yasuf u Zahidkah, which the aged poet wrote after his flight from Ghazni, and dedicated to the reigning caliph of Bagdad, al Qadir billah. It represents the oldest poetical treatment of the Biblical story of Joseph, which has proved so attractive to the epic poets of Persia, among others to 'Am'ak of Bokhara (d. 1140), who was the first to Firdousi to write a Yasuf u Zahidkah to Jami (d. 1402); Ma'aji Kasm Khan, Humayun's amir (d. 1571), Nasim of Herat (d. 1670), and Shaukat, the governor of Shiraz under Fath 'Ali Shah. Perhaps in part to Firdousi's Yasuf was his patron 'Unsuri's romance, Wamiq u Ashira, a popular Iranian legend of great antiquity, which had been first written in verse under the Tahirid dynasty. This favourite story was treated again by Fashti Jurjani (5th century of the Hegira), and by many modern poets— as Damiri, who died under the Safaw-s shah Mohammed (1577-1586; 985-994 a.h.), Nam, the historiographer of the Zand dynasty, and Hosain of Shiraz under Fath 'Ali Shah, the last two flourishing towards the beginning of the present century. Another love story of similar antiquity formed the basis of Fakr-ud-din As'ad Jurjani's Wis u Rمكان, which was composed in Isfahan about 1048 (440 a.h.)—a poem remarkable not only for its high artistic value but also for its resemblance to Gottfried von Strassburg's Tristan and Isol. The last-named Persian poet was apparently one of the earliest encomiasts of the Seljuks, and it was under this Turkish dynasty that lyrical romanticism rose to the highest pitch. What Firdousi and the court-poets of Sultan Mahmud had commenced, what Abul 'l-Faraq Rumi of Lahore and Mas'ud b. Sa'd b. Salman (under Sultan Ibrhim, 1595-1609) had successfully continued, reached its perfection in the famous group of panegyrist writers who gathered in the first half of the 6th century of the Hegira round the throne of Sultan Sinjar, and part of whom was that of his great antagonist, Asilu of Khwairizm. This group, who were also the Sa'di poets, were ordered by the prince in the Oxus about 1145 (540 a.h.), and his pupil Jauhari, the goldsmith of Bokhara; Amir Mu'izzl, the king of poets at Sinjar's court, killed by a stray arrow in 1147 (542 a.h.), Rashid Watwati (the Swallow) who died in 1182 (578 a.h.), and left, besides his kaşida, a valuable treatise on poetics (Haddiš-essih) and a metrical translation of the sentences of 'Ali, 'Abd-alawisi Jalabi, who sang at first, like his contemporary Hasan Ghazawi (d. 1160; 565 A.H.), the praise of the Ghaznavid shah Bahram, but afterwards bestowed his eulogies upon Sinjar, the conqueror of Ghazni; and Adb-ud-din Anvari, the most celebrated kaşida-writer of the whole Persian literature. Anvari (died between 1189 and 1191; 583 and 587 a.h.), who in empty life had pursued scientific studies in the madrasa of Tus, and who ranked among the foremost astronomers of his time, owes his renown as much to the inexhaustible store of poetical similes and epigrams which he showered upon Sinjar and other royal and princely personages, as to his cutting sarcasms, which he was careful to direct, not against individuals, but against whole classes of society and the cruel wrong worked by an inexorable fate—thus disregarding the example of Firdousi, whose attack upon Sultan Mahmud for having cheated him out of the reward for his epoche is the oldest and most finished specimen of personal satire. This legitimate branch of high art, however, soon degenerated either into the lower forms of comedy and travesty—for which, for instance, a whole group of Transoxanian writers, Súzant of Samarqand (d. 1714; 569 a.h.) and his contemporaries, Abû 'Ali Shatranj of the same town, Lami of Bokhara, and others gained a certain literary reputation—or into mere comic pieces and jocular poems like the "Pleasantries" (Hasiyiyiyu) and the humorous stories of the "Mouse and Cat" and the "Stone-cutter" (Sangiarash) by 'Ubaid of Hamadan (d. 1370; 772 a.h.). Anvari's greatest rival was Khakani (d. 1190; 595 a.h.), the son of a carpenter in Shirvan, and panegyrist of the shahs of Shirvan, usually called the Pindar of the East. To European taste over the shorter epigrams and the double-rhymed poem Tuhfatul'irşayin, in which Khakani describes his journey to Mecca and back, give full satisfaction. Among his numerous contemporaries and followers may be noticed Mujir-ud-din Bailakani (d. 1168; 594 a.h.); Zahir Faruqyyî (d. 1202; 598 a.h.) and Atihir Akhsikat (d. 1211; 608 a.h.)—all three panegyrist of the atabegs of Azerbaijan, and especially of Sultan Kızl Arslan—Kamal-ud-din Isfahani, tortured to death by the Moguls in 1237 (655 a.h.), who sang, like his father Jamal-ud-din, the praise of the geometers of Isfahan, and gained the epithet of the "creator of fine thoughts" (Khâliltul-ulum-anî); and Sa'id-ud-din Isfaranî (d. 1267; 666 a.h.), a favourite of the shahs of Khwairizm. Fruitful as the 6th and 7th centuries of the Hegira were in panegyric, they attained an equally high standard in didactic and mystical poetry. The origin of both can again be traced to Firdousi and his time. In the ethical reflections, wise maxims and moral exhortations scattered throughout the Shahnama, the didactic element is plainly visible, and equally plain in it are the traces of that mystical tendency which was soon to pervade almost all the literary productions of Persian genius. But the most characteristic passage of the epoche is the mysterious disappearance of Shâh Kaikhosrou, who suddenly, when at the height of earthly fame and splendour, renounces the world in utter disgust, and, carried away by his fervent longing for an abode of everlasting tranquillity, vanishes for ever from the midst of his companions. The first Persian who employed poetry exclusively for the illustration of Sûfî doctrines was Firdousi's contemporary, the renowned shahâb Abû Sa'id b. Abû l-Khair of Mahna in Khorasan (568-1045; 357-440 a.h.), the founder of that specific form of the rubâî which gives the most concise expression to religious and philosophical aphorisms—a form which was further developed by the great free-thinker 'Omar b. Khayyâm (q.v.), and Afdâl-ud-din Khâsh (d. 1307; 707 a.h.). The year of Abû Sa'id's death is most likely that of the first didactic mathnawi, the Râbân, a'sâhÎma or "Book of Enlightenment," by Nâsih Khosrav (q.v.), a poem full of sound moral and ethical maxims with slightly mystical tendencies. About twenty-five years later the first theoretical handbook of Sûfism in Persian was composed by 'Ali b. 'Uthmân al-Jullâbî al-Huxwirî in the Kashf-ul-umâhijb, or "Revelation of Hidden Things," which treats of the various schools of Sûfis, their teachings and observances. A great saint of the same period, Sheikh Abdallah Ansârî of Herat (866-1086; 596-481 a.h.), assisted in spreading the pantheistic movement by his Munâjât or "Invocations to God," by several prose tracts, and by an important collection of biographies of eminent Sûfis, based on an older Arabic compilation, and serving in its turn as groundwork for Jâmi's excellent Nasîfâbâhl-uhns (completed in 1478; 883 a.h.). He thus paved the way for the publication of one of the earliest textbooks of the whole sect, the Haqdistâhl-ikkat, or "Garden of Truth" (1500; 525 a.h.), by Hâkim Sanâ'î of Ghazni, to whom all the later Sûfî poets refer as their univalued master in spiritual knowledge. As the most uncompromising Sûfis appear the greatest pantheistic writer of all ages, Jalîl ud-din Rûmi (1037-1273; 640-672 a.h.; see Rîmî), and his scarcely less renowned predecessor Farid ud-din 'Attar, who was slain by the Moguls at the age of 114 lunar years in 1230 (657 a.h.). This prolific writer, having fulfilled the pilgrim-age to Mecca, devoted himself to a stern ascetic life, and to the composition of Sûfî works, partly in prose, as in his valuable "Biography of Eminent Mystic Divines," but mostly in the form of mathnawis (upwards of twenty in number), among which the Pandñâma, or "Book of Counsels," and the Munâjât-ulfâl, or the "Speeches of Birds," occupy the first rank. In the latter, an allegorical poem, interspersed with moral tales and pious contemplations, the final absorption of the Sûfi in the deity is most ingeniously illustrated. In strong contrast to these advanced Sûfis stands the greatest moral teacher of Persia, Sheikh Sa'dî of Shirzâh (died about 1110 lunar years old in 1302; 601 a.h.; see Sa'dî), whose two best known works are the Bu'tân, or "Fruit-garden," and
the "Galiston, or "Rose-garden." However, both have found comparatively few imitations—the former in the Dastürmdna, Sa'di's "Book of Exemplars," of Nizârî of Khoştân (d. 1320; 720 A.H.), in the Dakh Bâb, or "Ten Letters," of Kâtîbî (d. 1434; 818 A.H.), and in the Gulzar, or "Rose-bower," of Hairâtî (murdered 1554; 961 A.H.): the latter in Mu'n-uddîn Juwâînî's Nîgrîstân, or "Picture-gellery" (1335; 735 A.H.) and Jâmî's Bâhoristân, or "Spring-garden" (1487; 802 A.H.); whereas an innumerable host of purely Sûfî compositions followed in the wake of Sa'nûs's, A'târ's and Jâlûd ud-dîn Kûrû's mathnawîs. It will suffice to name a few of the most conspicuous. The "Lamûsâl, or "Sparks," of 'Irânî (d. between 1287 and 1309; 686 and 709 A.H.), the Zâd-ulsamsûrîn, or "Store of the Wayfarers," by Husâinî (d. 1318; 718 A.H.), the "Galison-ic-î, or "Rose-bed of Mystery," by Mahmûd Shâbistârî (d. 1320; 720 A.H.), the "Jâmî-ic-âm, or "Cup of Jamashîd," by A'bâdî (d. 1338; 758 A.H.), the "Anisul-ic-îrîfîn, or "Friend of the Mystics" by Kâsim (Qâsim)-ic-Anwârî (d. 1434; 837 A.H.), and others; "Asârî-ic-Mushkar, or "Sun and Jupiter" (1376; 778 A.H.), "A'rifî-ic-Chaûûnâr, or "The Ball and the Bat" (1438; 842 A.H.), "Husun-ic-Dil, or "Beauty and Heart," by Fâttiâsh of Nishâpurî (d. 1448; 852 A.H.), "Shâm-ic-Parsûnâr, or "The Candle and the Moth," by Ahî-ic-Shirzâî (1480; 894 A.H.), "Shâk-ic-Godâ, or "King and Dervish," by Hâlîlâ (put to death 1532; 939 A.H.), Bahâ-ud-dîn "Amîlî's (d. 1621; 1030 A.H.) "Namûn-ic-Halaw, or "Breath and Sweet," "Shîr-ic-Shâkor, or "Milk and Sugar," and many more.

During all these periods of literal activity, lyric poetry, pure and simple, had by no means been neglected; almost all the renowned poets since the time of Rûdâdî had sung in endless strains the pleasures of love and wine, the beauties of nature, and the alluring power of the Creator; but it was left to the incomparable genius of Hâyâtî (d. 1359; 791 A.H.; see Hâyâtî) to give to the world the most perfect models of lyric composition and the lines he had laid down were more or less strictly followed by all the ghazal-writers of the 9th and 10th centuries of the Hegira—by Sânûn of Sânûn (d. about 1377; 779 A.H.), who excelled besides in kâsîda and mathnawî; Kamâl Khujandî (d. 1400; 803 A.H.), Hâyâtî's friend, and protegé of Sûtan Hosûn (1374-1382 A.H.); Mohammedi Shîrîn Mâghrîbî (d. at Tâbrîz in 1406; 809 A.H.), an intimate friend of Kamâlî, Nî'mât-ullâh Wallî (d. 1431; 834 A.H.), the founder of a special religious order; Kâsim-ic-Anwârî (see above); Amîr Shâhî (d. 1453; 857 A.H.), of the princely family of the Sarbâdars of Sabzâwâr; Bannânî (d. 1512; 918 A.H.), who also wrote a romantic poem, Bâhrâm-ic-Bîrâzr; Bâbâ Fîgâñî of Shirzâî (d. 1519; 925 A.H.), usually called the "Little Hâyâtî"; Nâqqâsî (d. 1523; 938 A.H.); Lîsânî (d. 1534; 941 A.H.), who himself was imitated by Damîrî of Isfahân, Muhammed Kâshî, Wâshî Hâyâtî (all three died in the last decade of the 10th century of the Hegira); Ahî Shâhî (d. 1555; 942 A.H.), author of the Shîr-ic-Hayût; or "Lawful Witchcraft," which like Kâtîbî's (d. 1434; 838 A.H.) Majmûa-ulbâharîn, of the "Confluence of the Two Seas," can be read in two different metres; Nau'i (d. 1610; 1019 A.H.), who wrote the charming romance of a Hindu princess who burned herself in Akbar's reign with her deceased husband on the funeral pile, called Sâz-ic-Godâz, or "Burning and Melting," &c. Among the immediate predecessors of Hâyâtî in the 8th century of the Hegira, in which also Ibn Yâmîn, the great kîtâ-writers, flourished, the highest fame was gained by the two poets of Delhi, Amâr Hasân and Amîr Khorsåràu. The last, who died in 1325 (725 A.H.), two years before his friend Hasân, occupies the foremost place among all the Persian poets of India by the richness of his imagination, his graphic style, and the historical interest attached to his writings. Five extensive divâns testify to his versatility in all branches of lyric poetry, and nine large mathnawîs to his mastership in the epic line. Four of the latter are poetical accounts of the reigns of

the emperors of Delhi, 'A'llâ-ic-Khîljî (1296-1316), his predecessor Feraz Shâh and his successor Ktib-ic-Mahbûrâh Shâh—the Mîfâh-ul-utûtâh, or "Key of Victories," the Kûrân-ic-unâin, or "The Conjunction of the Two Lucky Planets," the Nah Sitting, or "Nine Spheres," and the love-story of Khîdhrûn-ic-Dwâslânîr. His other five mathnawîs formed the first attempt ever made to imitate Nizâmî's famous Khamåshâ, or five romantic epistles, and this attempt turned out so well that henceforth almost all epic poets wrote quintuples of a similar description. Khwâjâ Kûrân-î (d. 1352; 753 A.H.) was the next aspirant to Nizâmî's fame, with five mathnawîs, among which Hûmûn-ic-Hûmûzûn is the most popular, but he had to yield the palm to 'Abû ur-ràmâh Jâmî (1414-1492; 871-898 A.H.), the last classic poet of Persia, in whose genius were summed up all the best qualities of his great predecessors. Many poets followed in Jâmî's footsteps, first of all his nephew Hâtîtî (see above), and either wrote whole khamåshas or imitated at least one or other of Nizâmî's epistles; thus we have a Kûrân u Mûnjîn, for instance, by Mâhâbî (1440), Hûlî (see above), and Rûh-ulmânî (d. 1637). But their efforts could not stop the growing corruption of taste, and it was only at the court of the Mogul emperors, particularly of the great Akbar (1556-1605), who revived Sultan Mâhûb's "round table," that Persian literature still enjoyed some kind of "Indian summer" in poets like Ghazâlî of Mashhad or Meshed (d. 1572); 'Urîf of Shirzâî (d. 1591), who wrote spirited kâsîdas, and, like his contemporaries Wâshî and Kâthârî, a mathnawî, Farhûd-ic-Shûrûn, and Fai'dî (d. 1595), the author of the romantic poem, Nâl u Dâmon, who also imparted new life into the rubâtî. In Persia proper only Zalû, whose clever romance of "Sultan Mâhûb and his favourite Ayâz" (1592) is widely read in the East, Şâbîb (d. 1677), who is commonly called the creator of a new style in lyric poetry, and, among the most modern, Hâtîf of Isfahân, the singer of sweet and tasteful odes (died about 1786), deserve a passing notice.

But we cannot conclude our brief survey of the national literature of Persia without calling attention to the rise of the drama, which has only sprung up in the beginning of the nineteenth century. Like the Greek drama and the mysteries of the European middle ages, it is the offspring of a purely religious ceremony, which for centuries has been performed annually during the first ten days of the month Muharram—the recital of mournful lamentations in memory of the tragic fate of the house of the caliph 'A'lli, the hero of the Shî'î Persians. Most of these passion-plays deal with the slaughter of 'A'lli's son Hosûn and his family in the battle of Kerbêl. But lately this narrow range of dramatic subjects has been considerably widened, Biblical stories and even Christian legends have been brought upon the Persian stage; and there is a fair prospect of a further development of this most interesting and important movement. (See further Drama: Persia.)

In the various departments of general Persian literature not touched upon in the foregoing pages the same wonderful activity has prevailed as in the realm of poetry and fiction, since the first books on history and medicine appeared under the Sâmândîs (see above). The most important section is that of historical works, which, although deficient in sound criticism and often spoiled by a highly artificial style, supply us with most valuable materials for our own research. Quite unique in this respect are the numerous histories of India, from the first invasion of Sultan Mâhûb of Ghazni to the English conquest, and even to the first decades of the present century, most of which have been described and partly translated in the eight volumes of Sir H. M. Elliot's History of India (1867-1878). Persian writers have given us, besides, an immense variety of universal histories of the world, with many curious and noteworthy data (see, among others, Mîrkhîn's and Khwâjâmîn's works under Mîrkhîn); histories of Mahomet and the first caliphs, partly translated from Arabic originals, which have been lost; detailed accounts of all the Persian dynasties, from the Ghaznevids to the still reigning Kajars, of Jenghiz Khân and the Moguls (in Jûwâni's and Wasâfî's elaborate Tâ'rikhu'ab).
of Timur and his successors (see an account of the Zafarnama under PETES DE LA CROIX); histories of sects and creeds, especially the famous Doxbatlan, or "School of Manners" (translated by Shesh Bedevar, Paris 1843, and many local chronicles of Iran and Turan. Next in importance to history rank geography, cosmography, and travels (for instance, the Nukhat- ul-dub, by Hammadah Mustafti, who died in 1349, and the translations of Istakhri's and Kavzini's Arabic works), and the various tadkhiras or biographies of Sufis and poets, with selections in prose and verse, from the oldest of A'ufi (about 1220) to the last and greatest of all, the Makhzan-ul-garabi, or "Treasure of Marvellous Matters" (completed 1803), which contains biographies and specimens of mathematics of more than 3000 poets. We pass over the well-stocked sections of philosophy, ethics and politics, of theology, law and Sufism, of mathematics and astronomy, of medicine (the oldest treatise of which is the "Treasure of the shahe Khwarizam," 1110), of Arabic, Persian and Turkish grammar and lexicography, and only cast a parting glance at the rich collection of old Indian folk-lore and fables preserved in the Persian version of Kalila u Dimna (see RUDAGI), of the Sindbad-Folk-lore, the Tisvanama, or "Tales of a Parrot," and others, and at the translations of standard works of Sanskrit literature, the epopees of the Rámâyana and Mahabhárata, the Upanishads and the Yoga- Sutras of Patañjali, and numerous Persian, Turkish and Arab translations of the latter's Höfische und romantische Poesie der Perse (1887), and Mystische, didaktische und lyrische Poesie und das spätere Schriftthum der Perse (1888). See also P. Horn, Geschichte der persischen Literatur (1891). Concise sketches of Persian poetry and in Surey's Geschichte der mineralischen Chemie (Berlin, 1889); and of Persia's Biographical and Critical Notices of Persian Poets (1846); in G. L. Flügel's article in Ersch and Gruber's Allgemeine Encyklopädie (1842); in N. Bland's papers in the Journ. of the Roy. As. Soc., vii. 345 seq. and ix. 122 seq.; and in C. C. A. Barbier de Meynard's nos. in Perse (Paris, 1877). Real names of monarchs are the catalogues of A. Sprenger (Calculuta, 1834); W. H. Morley (London, 1854); Flügel (3 vols., Vienna, 1865); and C. Rieu (3 vols., London, 1878-1880). For the first five centuries of the Hegira compare Ethë's editions and metrical translations of "Rudagi's Vorlãufer und Zeitgenossen," in Morgenlandische Forschungen (Leipzig, 1875); of Kisa'i's songs, Firdousi's lyrics, and Abu So'd b. Abu 'l-Khair's rubâis, in Sitzungsberichte der bayernischen Akademie der Wissenschaften (May 1875 seq.); of Firdousi's "Shahnameh" in Perse (Paris, 1875), pp. 145 seq. and 178 seq.; and of Avicenna's Persian poems, in Göttinger Nachrichten (1875, p. 555 seq.); and of Asadi and his munazarat, in "Persische Tenzoren, Verzeichnung der persischen Tenzöre," 2 vols. (Strasbourg, 1801); and H. Zorenberg's Chronique de Tabari (Paris, 1867-1874); Jurjani's Wis u Rämin, ed. in the Bibl. Indica (1864) (trans. into German by C. H. Graf in Zeitschrift der morgenländischen Gesellschaft, xxiii. 375 seq.); and A. de B. Kurzimke's Specimen du divinum Monarchiae (Versailles, 1876). On Khâkânî, see N. de Khanîkov's "Mémoire," in Journal asiatique, 6th series, vol. iv. p. 137 seq. and vol. vi. p. 296 seq. and C. Salaman's edition of his rubâis, with Russian trans. (Petersburg, 1875); on Fa'ïrul uddin 'Atâ'ir, S. de Sacy's edition of his poetry (Strasbourg, 1839), and C. D. Muntak-uitarr (Paris, 1857); on the Ghiyshan-ràz, E. H. Whinfield's edition (London, 1886); and on Amir Khorasani's mathnawis, the abstracts given in Elliot's History of India, iii. 524 seq. German translations of these were made by W. D. Den Hartog, in the Deutsche Bibliothek (Vienna, 1852); of Jâmi's minor poems, by V. von Rosenweig (Vienna, 1840); by F. Rûckert, in Zeitschrift für die Kunde des Morgenlandes, vols. v. and vi., and Zeitschrift der ö. morgenl. Gesellschaft, xxxi. (1890); and F. Enke, in the Deutsche Forschungsberichte (Leipzig, 1853, and Vienna, 1858); German translation of Yusuf u Zulâkha, by Rosenweig (Vienna, 1824), English by R. T. H. Griffith (London, 1881); French translation of Lâl u Majûnî (Paris, 1805); German by A. T. Hartmann (Leipzig, 1878); of Asadi's rubâi, by R. Kühlmann (Leipzig, 1878); of 'Abd al-Haqq 'Abdallâh and 'Abd al-Samâ' (London, 1882) and Stud. (Leipzig, 1870, p. 197 seq.). On the Persian drama, compare J. A. de Gobineau's Récits et philosophies dans l'Asie centrale (Paris, 1866); A. Chodrous Théâtre persan (new ed., Paris, 1878); and Ethë, "Persische Passionspiele," in Morgenland. Stud. (Leipzig, 1867, p. 359 seq.).

PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUCDE (1808-1872), French statesman, was born at Saint-Germain-Lespinasse (Loire) on the 11th of January 1808, the son of a receiver of taxes. He was educated at Limoges, and entered the cavalry school at Saumur in 1826, becoming maréchal des logis in the 4th Hussars two years later. The share taken by his regiment in supporting the revolution of 1830 was regarded as insubordination, and next year Fialin was dismissed from the army. He became a journalist, and in 1833 became a strong Bonapartist, assuming the title of comte de Persigny, said to be dormant in his family. He planned the attempt on Strasbourg in 1836 and that on Boulogne in 1840. At Boulogne he was arrested and condemned to twenty years' imprisonment in a fortress, shortly afterwards commuted into mild detention at Versailles, where he wrote a book to prove that the Pyramids were built to prevent the Nile from silting up. This was published in 1845 under the title, De la Destinasion et de l'utilité permanente des Pyramides. At the revolution of 1848 he was arrested by the provisional government, and on his release took a prominent part in securing the election of Louis Napoleon to the presidency. With Morny and the marshall Saint Arnaud he plotted the restoration of the empire, and was a devoted servant of Napoleon III. He succeeded Morny as minister of the interior in January 1852, and later in the year became senator. He resigned office in 1854, being appointed next year to the London embassy, which he occupied with a short interval (1839-1859) until 1860, when he resumed the portfolio of the interior. But the growing influence of the "promoted" generations in 1862, when he received the title of duke. A more dangerous enemy than Rouher was the empress Eugénie, whose marriage he had opposed and whose presence in the council chamber he deprecated in a memorandum which fell into the empress's hands. He sought in vain to see Napoleon before he started to take the command in 1870, and the breach was further widened when master and servant were in exile. Persigny returned to France in 1871, and died at Nice on the 11th of January 1872.

See Mémoires du duc de Persigny (2nd ed., 1860), edited by H. de Laire d'Espagny, his former secretary; an eulogistic life, Le Duc de Persigny (1865), by Delaroue; and Emile Olivier's Empire libéré (1869, 8c.)

PERTSIMMON, the name given to the fruits of Diospyros virginiana in the United States. The tree which bears them belongs to the order Ebenaceae, is usually from 30 to 50 ft. in height, and has oval entire leaves, and unisexual flowers on short stalks. In the male flowers, which are numerous, the stamens are sixteen in number and arranged in pairs; the female flowers are solitary, with traces of stamens, and a smooth ovary with one ovule in each of the eight cells—the ovary is surmounted by a style which has a hairy base. The fruit-stalk is very short, bearing a subglobose fruit an inch to an inch and a half in diameter, of an orange-yellow colour, and with a sweetish astringent pulp. It is surrounded at the base by the persistent calyx-lobes, which increase in size as the fruit ripens. The astringency renders the fruit somewhat unpalatable, but after it has been subjected to the action of frost, or has become partially rotted or "blotted" like a medlar, its flavour is improved. The fruit is eaten in great quantities in the southern states of America, and is also fermented with hops, corn-meal or wheat-bran into a sort of beer or made into brandy. The wood is heavy, strong and very close-grained and used in turnery. The tree is very common in the South Atlantic and Gulf states, and attains its largest size in the basin of the Mississippi. It was brought to England before 1629 and is cultivated, but rarely if ever ripens its fruit. It is easily raised from seed and can also be propagated from stolons, which are often produced in great quantity. The Chinese and Japanese cultivate another species, the Diospyros Kaki, of which there exist numerous ill-defined varieties. The fruits are larger than those of the American kind, variable in shape, but have similar properties. An astringent fluid, known as shibu, rich in tannin, is expressed from the green fruit and used in various industries. The tree is hardy in the south of England and in the Channel Islands.
in Greek and in the modern European languages. The natural features of Persia are described very exactly by Nearcchus, the admiral of Alexander the Great (preserved by Arrian Indic. 40 and Strabo xv. 727). The country is divided into three parts, of very different character and climate: the coast is sandy and very hot, without much vegetation except date palms; it has no good harbours, and the climate is very unwholesome; the population is scanty. About 50 m. from the coast rise the chains of the mountains, through which some steep passes lead into the interior valleys (called κοιλάς Περσίας, Strabo xv. 729), which lie about 5000 ft. above the sea. Here the climate is temperate, the country watered by many rivers and lakes, the soil fertile, the vegetation rich, the cattle numerous. These regions, which were thickly populated, form the real Persis of history. "This land Persis," says Darius, in an inscription at Persepolis, "which Ahuramazda has given to me, which is beautiful and mild, and which is also an inheritance, the will of Ahuramazda and myself it trembles before no enemy." The third part is the north, which belongs to the central plateau, still much higher, and therefore rough and very cold in the winter. Towards the north-west it borders on the Median district of Paratacecne (about Isfahan); towards the north and north-east it soon passes into the great desert, of which only the oasis of Yezd (Ἰσταντίχας in Ptolem. vi. 4, 2) is inhabitable. In the east, Persis proper is separated by a desert (Laristan) from the fertile province of Carmania (Kerman), a mountainous region inhabited by a Persian tribe. To Carmania belonged also the coast, with the islands and harbours of Hormuz and Bander Abbas. In the west Persis borders on the mountains and plains of Elam or Susiana. For the ancient topography cf. Tomaschek, "Beiträge zur historischen Topographie von Persien," in Sitzungsber. der Wiener Akademie, phil. hist. cl. civili. oxxi.

The Persians are not mentioned in history before the time of Cyrus; the attempt to identify them with the Parsua, a district in the Zagros chains south of Lake Urmia, often mentioned by the Assyrians, is not tenable. The Parsua are perhaps the non-Aryan tribe ἰποροῖ in northern Media, Strabo xi. 508. Herodotus i. 125, gives a list of Persian tribes: the Persagades (at Murchah), Maraphii, Massili, Puthialaei (in western Carmania), Dorusaei, Germanii (i.e. the Carmanians) are husbandmen, the Dahae (i.e. the "enemies," a general name of the rapacious nomads, used also for the Turanian tribes), Mardi, Dropici, Sagartii (called by Darius Asagarta, in the central desert; cf. Herod. viii. 83) are nomads. The kings of the Persagades, from the clan of the Achaeimenidae, had become kings of the Elamite district Anahita (probably in 596, cf. Cyrus). When, in 553, Cyrus, son of Anar, rebelled against Astyages, the Maraphii and Massiplians joined with the Persagades; after his victory over Astyages all the Persian tribes acknowledged him, and he took the title of "king of Persia." But from then only the inhabitants of Persis proper were considered as the rulers of the empire, and remained therefore in the organization of Darius free from taxes (Herod. iii. 97). But Carmania, with the Sagartians, the Utians (called by Darius Yastyiya), and other tribes, formed a satrapy and paid tribute (Herod. iii. 93); the later authors therefore always distinguished between Carmania and Persis. Names of other Persian tribes, partly of very doubtful authority, are given by Strabo xv. 727, and Ptolem. vi. 4 and 8.

The Persians of Cyrus (see Persia: Ancient History) were a vigorous race of husbandmen, living in a healthy climate, accustomed to hardship, brave and upright; many stories in Herodotus (especially ix. 122) point the contrast between their simple life and the effeminate nations of the civilized countries of Asia. They were firmly attached to the pure creed of Zoroaster (cf. Herod. i. 131 sqq. and the inscriptions of Darius). When Darius had killed the usurper Smerdis and gained the crown, a new usurper, Vahyazdatha, who likewise pretended to be Smerdis, the son of Cyrus, rose in Yashtiya, but was defeated in two battles by Darius's generals and put to death (Behistun inscription). Cyrus had built his capital with his palace and tomb, in Pasargadæ (q.v.). Darius founded a new city about 30 m. farther south on the left bank of the Pulwar, near its confluence with the Kür, with a large terrace, on which his magnificent palace and that of his son Xerxes were built. As Pasargadæ was named after the tribe in whose district it lay, so the new capital is by the Persians and Greeks simply called the "Persians"; later authors call it Persepolis (q.v.), "the Persian city." Another Persian palace lay in Taqke, near the coast (Strabo xv. 728; Arrian Ind. 39; Dionys. Perieg. 1060); Gabae, which Strabo mentions besides, is Isfahan in Paratacecne and belonged already to Media.

Both in Persepolis and Pasargadæ large masses of gold and silver from the tribute of the subject nations were treasured, as in Susa and Ecbatana. But Persis lies too far off from the centre of the Asiatic world to be the seat of government. Like Arabia and similar countries, it could exercise a great momentary influence in history and produce a sudden change throughout the world; but afterwards it would sink into local insignificance. So the Persian kings fixed their residence at Susa, which is always considered as the capital of the empire (therefore Aeschylus wrongly considers it as a Persian town and places the tomb of Darius here). After the reign of Xerxes, Persis and Persepolis became utterly neglected, in spite of occasional visits, and even the palaces of Persepolis remained in part unfinished. But the national feeling of the Persians remained strong. When Alexander had won the victory of Arbela, and occupied Babylon and Susa, he met (in the spring of 330) with strong resistance in Persia, where the satrap Ariobarzanes tried to stop his progress at the "Persian gates," the pass leading up to Persepolis. Here he set fire to the cedar roof of the palace of Xerxes as a symbol that the Greek war of revenge against the Persians had come to an end. Our best information tells us that he soon had the fire extinguished (Plut. Alex. 38); the story of Thais is a pure fiction, and we may well believe that he repented the damage he had done (Arrian vi. 30, 1).

Alexander had planned to amalgamate the former rulers of the world with his Macedonians; but his death was followed by a Macedonian reaction. Paecestas, the new satrap of Persis, followed the example of Alexander, and thus gained a strong hold on his subjects (Diod. xix. 48); nor did Seleucus, to whom the dominion of the east ultimately passed (from 311 onwards), disdain the aid of the Persians; he is the only one among the Diadochi who retained his Persian wife, Apame, gift of Alexander. The satrap of Carmania, son Antiochus I Soter tried to introduce Hellenism into Persia. Of Greek towns which they founded here we know Alexandria in Cilicia (Pline. vi. 107; Ptol. vi. 8, 14; Ammian. Marc. 23, 6, 49), Laodicæa in the east of Persia (Pline. 6, 115), Stasis, "a Persian town on a great rock, which Antiochus, the son of Seleucus, possessed" (Steph. Byz. s.â.), Antiochia in Persis, founded apparently by Seleucus I and peopled by Antiochus I. with immigrants called together from all Greece, as we learn from a psichisma passed by "boult and demos" of this town in 206 in honour of Magnesia on the Maender (Kern, Inschriften von Magnesia am Maender, No. 61 = Dittenberger, Orientis gr. inscr. 233, where they are mentioned together with a great many Seleucid towns in Susiana and Babylonia, and compare Kern, No. 18 = Dittenberger, No. 231). An insurrection of the Persians against Seleucus II is mentioned also in two stragmanns of Polyaeus (vii. 39. 40). When in 221 Molon, the satrap of Media, rebelled against Antiochus III, his brother Alexander, satrap of Persis, joined him, but they were defeated and killed by the king. Persis remained a part of the Seleucid empire down to Antiochus IV. Epiphanes, who at the end of his reign restored once more the authority of the empire in Babylonia, Susiana and Persis; perhaps a battle, in which the satrap Numenius of Mesene (southern Babylonia) defeated the Persians on the shore of Carmania on sea and land (Pline. vi. 153), belongs to this time. But after the death of Antiochus IV. (164) the
Persis

Seleucid Empire began to dissolve. While the central provinces, Media and northern Babylonia, were conquered by the Parthians, Mesene, Elymais and Persis made themselves independent.

Persis never became a part of the empire of the Arsacids, although her kings recognized their supremacy when they were strong (Strabo xv. 728, 736). From the peripatus of the Erythraean Sea 33-37 we learn that their authority extended over the shores of Carmania and the opposite coasts of Arabia. A Persian king, Artaexerxes, who was murdered by his brother Gosthros at the age of 93 years, is mentioned in a fragment of Isidore of Charax (Lucian, Macrobii, i, 5). Other names occur on their coins, the oldest of which are imitations of Seleucid coins, and were perhaps struck by local dynasts under their supremacy; most of the others show the king's head with the Persian tiara, and on the reverse a fire-altar with the adoring king before it, a standard (perhaps the famous banner of the smith Kavi, which became the standard of Iran under the Sassanids), and occasionally the figure of Ahuramazda; they were first explained by A. D. Moodtman in Zeitschrift für Numismatik, iii., iv. and vii.; cf. Grundriss der iranischen Philol. i. 486 seq. The legends are in Aramaic characters and Persian (Pahlavi) language; among them occur Artaexerxes, Darius (from a dynasty of this name the town Darabjird, "town of Darius," in eastern Persia seems to derive its name), Narses, Tiridates, Manochir and others; the name Vahurz seems to be identical with Oboros, mentioned by Polyaenus vii. 40, who put down a rebellion of 3000 settlers (άρχων) in Persis. From the traditions about Ardashir I. we know that at his time there were different petty kingdoms and usurpers in Persis; the principal dynasty is by Tabari called Bāzragi. The coins demonstrate that Hellenism had become quite extinct in Persis, while the old historical and mythical traditions and the Zoroastrian religion were supreme. There can be no doubt that at this time the true form of Zoroastrianism and the sacred writings were preserved only in Persis, whereas everywhere else (in Parthia, in the Indo-Scythian kingdoms of the east and in the great propagandist movement in Armenia, Syria and Asia Minor, where it developed into Mithraism) it degenerated and was mixed with other cults and ideas. So the revival of Zoroastrianism came from Persis. When Ardashir I. attempted to restore the old empire of Cyrus and Darius, and in 212 A.D. rose against the Parthian king, Artabanus, his aim was religious as well as political. The new Sassanid Empire which he founded enforced the restored religion of Zoroaster (Zarathustra) on the whole of Iran.

The new capital of Persis was Isatkar on the Pulwar, about 9 m. above the Persian Gulf, now Hāljābā, where even the predecessors of Ardashir I. are said to have resided. It was a great city under the Sassanids, of which some ruins are extant. But it shared the fate of its predecessor; when the empire was founded the Sassanids could no longer remain in Persis but transferred their headquarters to Ctesiphon.

(Persius), in full Aulus Persius Flaccus (A.D. 34-62), Roman poet and satirist. According to the Life contained in the MSS., Persius was a native of Volaterrae, of good stock on both parents' side. When six years old he lost his father, and his step-father died in a few years. At the age of twelve Persius came to Rome, where he was taught by Remmius Palaemon and the rhetor Verginius Flavus. Four years later began a close intimacy with the Stoic Cornutus. In this philosopher's pupil Lucan, Persius found a generous admirer of all he wrote. Still in early youth he became the friend of the lyric poet Caesius Basilius, whilst with Traianus Persius (whose wife Arria was his relative) he had a close friendship of ten years' duration and shared some travels. Seneca he met later, and was not attracted by his genius. In his boyhood Persius wrote a tragedy dealing with an episode of Roman history, and a work, the title of which is rendered uncertain by corruption in our MSS. Pithous generally accepted reading makes the subject that of travel; the excursions with Thrasea however must have taken place after boyhood. The perusal of Lucilius revealed to Persius his

vocation, and he set to work upon a book of satires. But he wrote seldom and slowly; a premature death (sui stoma) prevented the completion of his task. He is described as possessed of a gentle disposition, girlish modesty and personal beauty, and living a life of exemplary devotion towards his mother Fulvia Sisenna, his sister and his aunt. To his mother and sister he left a considerable fortune. Cornutus suppressed all his work except the book of satires in which he made some slight alterations and then handed it over to Bassus for editing. It proved an immediate success.

The scholia add a few details—on what authority is, as generally with the scholia, uncertain, sources, whether Persius himself, though not free from the suspicion of interpolation and doubtful correctness, and disordered in places, is probably trustworthy. The MSS., say it came from the commentary of Valerius Probus, no doubt a learned Persius like Cornutus. Persius liked Horace and Virgil and Horace by this same famous "grammarians" of Berytus, the poet's own opinion of him. The only case in which it seems to conflict with the Satires themselves is in its statement as to the death of Persius's father. The declaiming corpses in the presence (Sat. 3. 4 sq.) implies a more mature age than that of six in the performance. But as noted above, but "step-father," or Persius may have forgotten his own autobiography, may be simply reproducing one of his models. The line seems to be that of the Satires agree so closely does not of course prove the authenticity of the Horace. One of the points of harmony is, however, too subtle for us to believe that a forged evoked it from the world of Persius. It requires indeed a thoughtful reading of the Life before we realize how distant is the impression of "bookishness," and least of all the feel, in spirit, from the domestic heart and his-women-folk. And of course this is notoriously the picture drawn by the Satires. So much better does Persius know his books than the world that he draws the names of his characters from them, the picture only what as occurs within his narrow horizon, he cannot but discern the seamy side of life (cf. e.g. such hints as Sat. iii. 110); he shows, however, none of Juvenal's undue stress on unsavoury detail or Horace's easy-going acceptance of their weakness. Persius, as we have seen, in whole phrases, thoughts and situations come direct from him. The resemblance only emphasizes the difference between the caricaturist of Stoicism and its preacher. Persius strikes the highest note that Roman satire reached; in earnestness and moral purpose rising far superior to the political rancour or good nature of Persius, and the rhetorical indignation of Juvenal, he seems a forerunner of the great Christian Apologists. From him we learn a lesson Seneca never taught, how that wonderful philosophy could work on minds that still preserved the depth and purity of the old Roman grandiosus. When the Life speaks of Seneca's genius as not attracting Persius, it presumably refers to Seneca the philosopher. Some of the parallel passages in the works of the two are very close and hardly advisable to explanation by assuming the use of a common source. With Seneca, Persius censures the style of the day, and imitates it. Indeed, in some of its worst failings, strain of expression, excess of detail, exaggeration, he outbids Seneca, whilst the obscuration, which makes his little book of not seven hundred lines so difficult to read and is in no way due to great depth of thought, compares very ill with the terse clearness of the Epistolae morales. A curious contrast to this tendency is presented by his free use of "popular" words. As of Plato, so of Persius we hear that he emulated Sophron; the authority is a late one (Lylius, De mag. i. 41), but we can at least recognize in the scene that opens Sat. 3. kinship with such work as Theocritus' Adonisae and the Mimes of Herodas. Persius's satires are composed in hexameters, except for the few lines 

The description of the recital and the literary twaddle after dinner is vividly natural, but an interesting passage which cites specimens of smooth
PERSON—PERSONALITY

255

The term "person" is used in a variety of ways, often to denote a distinct individual or entity. In legal contexts, a "person" can refer to a human being, a legal entity, or a group of individuals. However, the concept of a person is not limited to legal contexts; it also plays a role in philosophy, psychology, and other fields.

In philosophy, the concept of a person is often discussed in relation to the nature of the self and the mind. The term is used to refer to an individual who is distinct from others, and who possesses a sense of self and identity.

In psychology, the concept of a person is used to describe an individual's unique characteristics, including their personality traits, behaviors, and mental processes. The term is used to refer to an individual who is distinct from others, and who possesses a sense of self and identity.

The concept of a person is also used in law, where it can refer to a natural person, such as a human being, or a legal person, such as a company or organization. The term is used to refer to an individual who is distinct from others, and who possesses a sense of self and identity.

In conclusion, the concept of a person is a complex one that is used in a variety of ways across different fields. It is a term that is used to refer to an individual who is distinct from others, and who possesses a sense of self and identity.

[Note: The above text is a brief overview of the concept of a person and its usage in different fields. For more information, please consult a relevant text or reference material.]
PERSONAL PROPERTY—PERSONATION

self from the not-self arises the phrase "personal equation" for those peculiar characteristics or idiosyncrasies which have to be taken into account in estimating the value of an individual judgment or observation. This phrase, which is commonly used in any connexion, was first applied to the errors detected in the astronomical observations of a Greenwich observer named Kinnebrook in 1795. The recognized fact that the greater or less inaccuracy is habitual to individual observers has been investigated, e.g. by Bessel (Abhandlungen, iii. 300) and by Wundt (Physiol. Psychol.), and machines have been devised which make allowance for the error caused by the personal equation (see MICROMETER).

For the psychological problem, see PSYCHOLOGY. For the problems connected with sub-concious action, &c., see SUBLIMINAL SELF; TRANCE; HYPNOTISM; TELEPATHY.

PERSONAL PROPERTY, one branch of the main division of the English law of property, the other being "real property." The division of property into real and personal represents in a great measure the division into immovable and movable incidentally recognized in Roman law and generally adopted since. "Things personal," according to Blackstone, "are goods, money, and all other movables which may attend the owner's person wherever he thinks proper to go" (Comm. ii. 16). This identification of things personal with moveables, though logical in theory, does not, as will be seen, perfectly express the English law, owing to the somewhat anomalous position of chattels real. In England real property is supposed to be superior in dignity to personal property, which was originally of little importance from a legal point of view. This view is the result of feudal ideas, and had no place in the Roman system, in which immovables and moveables were dealt with as far as possible in the same manner, and descended according to the same rules. The main differences between real and personal property which still exist in England are these. (1) In real property there can be ownership rather than limited ownership; there can be no estate properly so called in personal property, and it may be held in complete ownership. There is nothing corresponding to an estate-tail in personal property; words which in real property would create an estate-tail will give an absolute interest in personality. A life-interest may, however, be given in personality, except in articles quae ipso usu consummatur. Limitations of personal property, equally with those of real property, fall within the rule against perpetuities. (2) Personal property is not subject to various incidents of real property, such as rent, dower or escheat. (3) On the death of the owner intestate real property descends to the heir; personal property is divided according to the Statute of Distributions. (4) Real property as a general rule must be transferred by deed; personal property does not need so solemn a mode of transfer. (5) Contracts relating to real property must be in writing by the Statute of Frauds, 29 Car. II. c. 3, s. 4; contracts relating to personal property need only be in writing when it is expressly so provided by statute, as, for instance, in the cases falling under s. 17 of the Statute of Frauds. (6) A will of lands need not be proved, but a will of personality or of personal and real property together must be proved in order to give a title to those claiming under it. (7) Devises of real estate fall as a rule within the Mortmain Acts (see CHARITY AND CHARITIES; CORPORATION); bequests of personal property, other than chattels real, are not within the act. (8) Mortgages of real property need not generally be registered; mortgages of personal property for the most part require registration under the Bills of Sale Acts (see PLEDGE, and BILL OF SELL). Personal estate is divided in English law into chattels real and chattels personal; the latter are again divided into choses in possession and choses in action (see CHATEL; CHOICE).

Interest in personal property may be either absolute or qualified. The latter case is illustrated by animals ferae naturae, in which property is only coextensive with detention. Personal property may be acquired by occupancy (including the law of accesso, commixito, and confusio of Roman law), by invention, as patent and copyright, or by transfer, either by the act of the law (as in bankruptcy, judgment and intestacy), or by the act of the party (as in gift, contract and will). There are several cases in which, by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property prima facie real which is treated as personal is an estate pur aude vie, which, since 14 Geo. II. c. 20, s. 9, 1740-1741 (now replaced by the Wills Act 1837, s. 6) is distributable as personal property in the absence of a special occupant. Examples of property prima facie personal which is treated as real are fixtures, heirlooms, such as deeds and family portraits, and shares in some of the older companies, as the New River Company, which are real estate by statute. In ordinary cases shares in companies are personal property, although the shareholders have individually some interest in the land as land.

The terms heritable and movable of Scots law to a great extent correspond with the real and personal of English law. The main points of difference are these. (1) Leases are heritable as to the succession to the lessor, unless the destination expressly exclude movables. (2) Chattels real and movables as to which mortgages and securities on land is personal in England. At common law in Scotland debts secured on heritable property are themselves heritable. But by the Titles to Land Consolidation (Scotland) Act 1874, heritable title to movables as to which, by the Act, the succession of the creditor, unless executors are expressly excluded. They still, however, remain heritable quod fiscum, as between husband and wife, and in computing legitim, and as regards the property of the deceased. (3) Up to 1868 the heir of a dower succeeded to certain movable goods called heirship movables, which bore a strong likeness to the heirlooms of English law. This right of the heir was abolished by the act of 1868, s. 160. (4) Annuities, as having fœustum futurum tempore, are heritable, and an obligation to pay them falls upon the heir of the deceased (Watson, Law Dict. s. v. "Annuities").

The law in the United States agrees in most respects with that of England. The heirloom theory of the citizen of New York, that the importance of title-deeds is much less than it is in England, owing to the operation of the Registration Acts. Long terms in some states have assented to them the properties of freehold estates. In some states estates pur aude vie descend like real property; in others an estate pur aude vie is deemed a freehold only during the life of the grantee; after his death it becomes a chattel real. In yet other states the heir has a scintilla of interest as special occupant (see 1st Taylor ed. of 1868, s. 21; 2d ibid. ed. 1874, s. 20). The problem of the heir to personal estate is considered as purely personal, in others it has been held to be a fixture, and so to partake of the nature of real property. Shares in some of the early American corporations were, like New River Company, at common law, movables. But in the Cape Company in Maryland (Scholes, Law of Personal Property, i.), in Louisiana animals employed in husbandry are, slaves were, regarded as immovables. Pews in churches are generally real property, but in some states they are made personal property by statute. The assignment of choses in action is generally permitted, and is in most states regulated by statute. (J. W.)

PERSONATION, in English law, a form of fraud consisting in a false representation by one person (by words or conduct) that he is another person living or dead. It is not an offence by the common law unless the representation is made on oath under circumstances constituting the offence of perjury, or unless the representation if not made on oath is made under circumstances amounting to a common law cheat. Personation has been made an offence by statute in the following cases: (1) where it amounts to a false pretense by words or conduct, and is done with intent to defraud, and property is by such false pretense obtained, 24 & 25 Vict. c. 96 ss. 28, 37 (see FALSE PRETENCES); (2) if the personation is the person of the heir, executor, administrator, wife, widow, next of kin or relative of any person with intent fraudulently to obtain any land, estate, chattel, money, valuable security or property (37 & 38 Vict. c. 36 s. 1); (3) in the case of personation of votes at elections (see CORRUPT PRACTICES).

The first of these offences is a misdemeanour only; the second is a felony punishable by penal servitude for life. The second offence was created in 1874 in consequence of the Tichborne case, in which under the law as it then stood it had been necessary...
to prosecute the claimant for perjury. Besides the enacts above referred to there are also a number of provisions for dealing with the personation of sailors, soldiers, pensioners and owners of stock in the public funds or shares in joint-stock companies, and of persons who falsely acknowledge in the name of another recognizances, deeds or instruments, before a court or person authorized to take the acknowledgment.

PERSPECTIVE (Lat. perspicere, to see through), in mathematics the name given to the art of representing solid objects by a plane drawing which affects the eye as does the object itself. In the article Projection it is shown that if all points in a figure be projected from a fixed centre to a plane, each point on the projection will be the projection of all points on the projecting ray. A complete representation by a single projection is therefore possible only when there is but one point to be projected on each ray. This is the case by projecting from one plane to another, but it is also the case if we project the visible parts of objects in nature; for every ray of light striking the eye starts from that point in which the ray, if we follow its course from the eye backward, meets for the first time any object. Thus, if we project from a fixed centre the visible part of objects to a plane or other surface, then the outlines of the projection would give the same impression to the eye as the outlines of the things projected, provided that one eye only be used and that be at the centre of projection. If at the same time the light emanating from the different points in the picture could be made to be of the same kind—that is, of the same colour and intensity and of the same kind of polarization—as that coming from the objects themselves, then the projection would give sensibly the same impression as the objects themselves. The art of obtaining this result constitutes a chief part of the technique of a painter, who includes the rules which guide him under the name of perspective, distinguishing between linear and geometrical perspective—the former relating to the projection, to the drawing of the outlines, the latter to the colouring and the shading of the colours in order to give the appearance of distance. Here we deal only with the former, which is in fact a branch of geometry consisting in the applications of the rules of projection.

§ 1. Our problem is the following: There is given a figure in space, the plane of a picture, and a point as centre of projection; it is required to project the figure from the point to the plane.

From what has been stated above (§ 10, fig. 1) in general it follows at once that the projection of a point is a point, that of a line a line. Further, the projection of a point at infinity in a line is in general a finite point. Hence parallel lines are projected into a pencil of parallel lines. This point is called the vanishing point of the direction to which it belongs. To find it, we project the point at infinity in one of the parallel lines: that is, we draw through the eye a line in the given direction. This cuts the picture plane in the point required.

Similarly all points at infinity in a plane are projected to a line (see Projection: § 6) which is called the vanishing line of the plane and which is common to all parallel planes.

All lines parallel to a plane have their vanishing points in a line, viz. in the vanishing line of the plane.

In perspective is called the point of sight, ABMN a horizontal plane on which we suppose the objects to rest of which a perspective drawing is to be made. The lowest plane which contains points that are to appear in the picture is generally selected for this purpose, and is therefore called the ground plane, or sometimes the geometrical plane. It cuts the picture plane in a horizontal line AB called the ground line or base line of the picture. A horizontal line SV drawn through the eye S perpendicular to the picture, cuts the latter at a point V called the centre of the picture or the centre of vision in the picture. The distance SV of the eye from the picture is often called the distance simply, and the height ST of the eye above the ground the height of the eye.

The vanishing line of the ground plane, and hence of every horizontal plane, is the line drawn through the projecting rays from S to the points at infinity in the plane—in other words, by drawing all horizontal rays through S. These lie in a horizontal plane which cuts the picture plane in a horizontal line DD' through the centre V (fig. 2). This line is called the horizon in the picture. It contains the vanishing points of all horizontal lines, the centres of vision V being the vanishing point of all lines parallel to SV, that is perpendicular to the picture plane. To find the vanishing point of any other line we draw through S the ray projecting one point at infinity in the line; that is, we draw through S a ray parallel to the line, and determine the point where this ray cuts the picture plane. If the line is given by its plane on the ground plane, and its elevation on the picture plane, then its vanishing point can at once be determined; it is the vertical trace of a line parallel to it through the eye (cf. Geometry: § Descriptive, § 6).

§ 3. To have construction in a single plane, we suppose the picture plane turned down into the ground plane; but before this the ground plane is pulled forward till, say, the line MN takes the place of AB, and then the picture plane is turned down. By this we keep the plan of the figure and the picture itself separate. In this new position the plane of the picture will be that of the paper (fig. 2). On it are marked the line AB, the centre of vision V, and the horizon DD', and also the limits ABKL of the actual picture. These, however, may only be necessarily marked. In the plan the picture plane must be supposed to pass through AB, and to be perpendicular to the ground plane.

If we further suppose that the horizontal plane parallel to the eye on which we place the picture plane, we cut the picture plane in the horizon DD' be turned down about the horizon, then the centre of sight will come to the point S, where VS equals the distance of the eye.

To find the vanishing point of any line in a horizontal plane, we have to draw through S a line in the given direction and see where it cuts the horizon. For instance to find the vanishing points of the two horizontal directions which make angles of 45° with the horizon, we draw through lines SD and SD' making each an angle of 45° with the line DD'. These points can also be found by making VD and VD' equal to the distance SV. The two points D, D' are therefore called the distance points.
